THE CYANIDE PROCESS FOR WORKING SULPHURET ORES, Pages 3 to 12.

LIBRARY

MINING AND SCIENTIFIC PRESS.

An Illustrated Journal of Mining, Mechanics and Popular Science.

VOL. LXV. – Number 1. DEWEY PUBLISHING CO. 90771 SAN FRANCISCO, SATURDAY, JULY 2, 1892. Three Dollars per Annum. Single Copies, 10 Cents.

The MacArthur Metallurgical Filter.

The metallurgical filter patented by John S. MacArthur in this country Dec. 24, 1889, is intended for precipitating and separating precious metals from solutions containing them, such, for instance, as chlorides, bromides, theosulphates (sometimes called "hyposulphites"), or sulphates obtained in the well-known Plattner, Von Patera, Russell, Ziervogel and Augustine extracting processes.

The object of the invention is to provide a filter having a large active surface for the metals in solution.

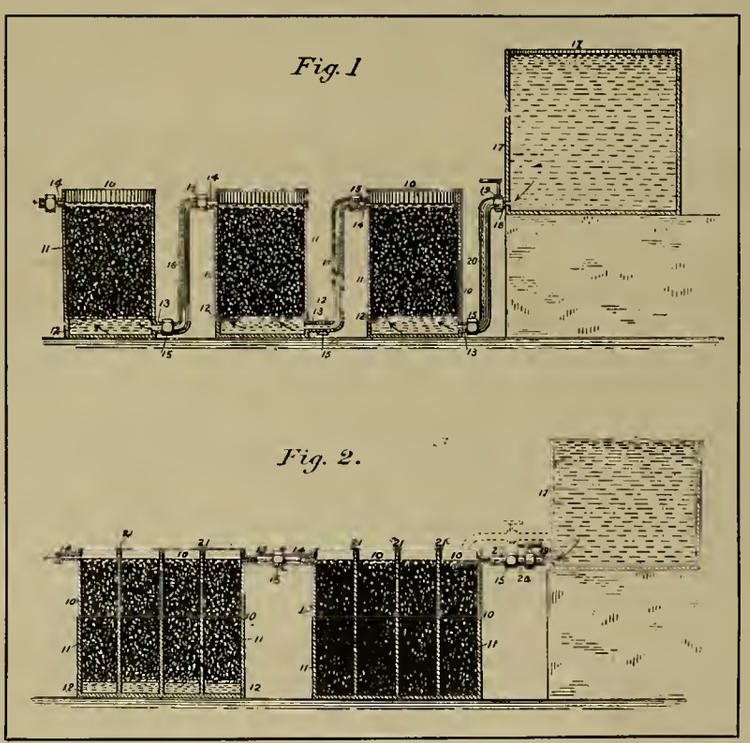
In the accompanying drawings, Fig. 1 is a sectional elevation of a series of these improved filters. Fig. 2 is a longitudinal vertical section of a filtering apparatus comprising two of these improved filters constructed in modified form. The zinc filiform sponge constitutes the principal feature of this improved filter.

Similar numerals of reference indicate corresponding parts in the different figures. This improved filter comprises a containing vessel, 10, and a zinc sponge, 11, disposed therein. The zinc sponge is preferably supported on a perforated false bottom, 12, disposed within said vessel near the bottom proper thereof. The vessel is provided with an inlet tube, 13, and an outlet tube, 14, the inlet tube being preferably disposed near the bottom of the vessel and the outlet tube near the top thereof, each of said tubes being provided with a coupling-nut, 15, when the vessels are used in series.

A number of these filters is preferably arranged in series, as represented in Fig. 1, from six to ten being ordinarily employed. When so arranged, the filters are connected by pipes ,16, which extend from the outlet near the top of one vessel to the inlet near the bottom of the adjacent vessel. A reservoir or tank, 17, for containing the solution holding the precious metals is disposed adjacent to the first filter of the series and elevated a sufficient distance to secure a proper flow of the liquid through the filters. This tank is provided with an outlet tube, 18, near its bottom, said tube being provided with a stopcock, 19, and connected by pipe, 20, with the inlet tube of the first filter of the series.

The zinc sponge, which constitutes the filtering material and precipitant, is preferably composed of fine threads or filaments of zinc interlocked together. The zinc threads from which the sponge is formed are cut by a turning tool from a series of zinc disks held between lathe centers and turned; or the zinc sponge may be formed by passing molten zinc, at a temperature just above the melting-point, through a fine sieve and allowing it to fall into water. This improved zinc sponge presents a very large contact surface for the action of the solution, and it does not become easily choked. Each containing vessel may be provided with a vertical partition or partitions, 21, as illustrated in Fig. 2, whereby the vessel is divided into two or more compartments or filtering chambers. These partitions extend to a point near the bottom or top of the vessel, as the case may be, or they are provided with holes near the top or near the bottom of the vessel. In case the vessel has three or more filtering chambers, the partitions are provided with communicating openings, disposed alternately near the bottom and top of the vessel, whereby the passage of the solution is downward through one of the filtering chambers, upward through the adjoining filtering chamber and downward again through the third filtering chamber, and so on.

In the use of this improved filtering apparatus the solution containing the precious metal is placed in tank 17, and the cock 19 is opened. In case a series of separate filters is employed, as represented in Fig. 1, the solution passes from the tank through the pipe 20 and into the first filter of the series, near the bottom thereof, beneath the false bottom 12, thence upward through the zinc sponge within the filter, thence outward near the top of the first filter, thence through the connecting-pipe to the next filter of the series, where it again enters near the bottom and passes upward through the zinc sponge to the top of the second filter of the series, and so on. The metal which is not precipitated by the first filter, is caught in the zinc sponge of the succeeding filters of the series.



MAC ARTHUR'S FILTER WITH ZINC SPONGE.

In case filters having a number of compartments are employed, the solution is preferably admitted to the first compartment at the top thereof, and passes down through the zinc sponge contained in said compartment to near the bottom thereof, and thence passes into the second compartment and upward through the zinc sponge therein contained, to near the top of said compartment, and thence downward through the next compartment, and so on through the several compartments of the compound filter, and thence to the next compound filter of the series, and through its several compartments. The precious metal may be separated from the zinc sponge by distillation, or the zinc sponge containing the precious metal may be placed in a suitable sieve and subjected to a screening operation, preferably under water. In this operation the greater part of the precious metal will pass through the sieve, and the greater part of the zinc sponge will remain therein.

Solvent Processes.

Solvent processes for working gold ores, such as those of Plattner, Mears, Newberry & Vautin, Pollok, Rothwell, Thiess, MacArthur-Forrest, and others, depend for their success on certain methods of dissolving and obtaining the gold in solution and precipitating it from the solution. There are a number of chemical substances which dissolve gold, and there are others which convert it into a soluble salt.

The ordinary mechanical methods of collecting gold from sands, gravel or rock have been carried on for ages, changing slightly as to appliances, but all based on the same general principle. Early in this century the metallurgists began to search for other methods of treating complex gold ores, though with but little success. But about 40 years ago, for the first time, it was proposed to treat these ores in a way similar to that carried on by natural forces, in dissolving and then depositing the gold.

There are many patents covering these solvent processes. A complete list of these is given in O'Driscoll's work on "Treatment of Gold Ores;" and in that he says: "Very little of the researches of the past generation are generally known by the present; in fact, even those who are supposed to have this knowledge possess little information on the subject; this is the only inference which can be drawn from the records of the solvent processes patented during the past 40 years."

The first one in this list compiled by O'Driscoll, is the patent of Prince Pierre Bagration, in 1843, who appears to have been the first to have used cyanide of potassium as a process for dissolving gold. He refers to the older methods of Elkinton (London), who used a double cyanide of potassium and iron as a dissolving medium, and Jacobi, who used ferrous cyanide for the same purpose. Among the last patents mentioned is that of MacArthur-Forrest, 1887. After looking over this long list of solvent processes, with their complicated patent claims, etc., the question is how have they progressed, and where are they practically applied. Mr. O'Driscoll answers this by saying that out of the long list, only two methods are in use to-day. One of these is the Plattner chlorination process so fully described by Kustel, and the other the Newberry-Vautin. To this may be added the MacArthur-Forrest.

It seems strange, however, that if these cyanide and other solvent processes were so well-known for so long, that they were not in use. Few are mentioned in the standard works on metallurgy in any detail. Either most of them must have been failures or mere laboratory experiments.

In fact, very few even of the accomplished metallurgists knew much about the use of cyanide for treating gold ores in a process. They knew of it as a solvent for gold, and knew of zinc for use by photographers in throwing gold down. But as to using these things on a large scale for working ores, no one seems to have done it until within the past few years. Either the methods adopted failed, or the matter was neglected. At all events, it has remained for the MacArthur-Forrest people to bring the system to the front in a practical way.

Mining Machinery Models.

It is the intention of the Patent Office to make, at the World's Columbian Exposition at Chicago in 1893, an exhibit which will show that great advance in the several arts which is due, in large measure, to the encouragement and support afforded by our patent system. This exhibit is to consist of models of patented inventions, which will be carefully selected, to show as far as possible the inception of each art, the stages through which the art has advanced, and the final development reached at the present time. This display of typical inventions embodied in concrete form and properly arranged will, it is believed, constitute a grand historical exhibit of the progress of the useful arts, and one which will be of great interest not only to inventors and manufacturers, but to the public generally. The Patent Office is not in possession of the models of many valuable inventions which might be included in the proposed exhibit, and inventors and manufacturers are asked to assist it by loans of models already built.

Circulars are being sent to this coast and elsewhere asking for models of stamp-mill plants, concentrators, concentrator belts, amalgamators, pans, settlers, ore crushers, etc. This will be a good way to give an exhibit of our progress in the construction of mining machinery. A great many of the mechanical appliances of mining and metallurgy originated in California and Nevada, especially in connection with the milling of ores, and our manufacturers and inventors will do well to make some preparation toward exhibiting their things.

Models should be constructed of metal or hard wood, or both, and should be strongly made in order to withstand handling in transportation. They should be well proportioned and as small as will properly show the machine or device. If a machine, the model should, where practicable, not occupy more than one square foot of shelf space, and should not be more than 20 inches in height. In no case should models be more than 24 inches by 18 inches at the base by 20 inches in height unless by special arrangement.

Models should be neatly made and well finished. Parts constructed of wood should be stained, grained or polished, and parts constructed of metal should be, where not painted, well polished.

Labels placed on exhibits will set forth the general nature of the invention, name of the inventor, under what patent manufactured, by whom the model is loaned, capacity of the machine, and, when desired, where in the Exposition a working machine may be seen. It is, therefore, requested that these facts, where pertinent, be stated in the letters of transmittal.

Others May Get the Gold.

Sacramento county, through its attorney Robt. T. Devlin, has served injunctions on two more mines operating at Gold Run, for permitting debris to run into the river. The men who have been running these mines, in the face of the agreement made by the Miners' Association, will get no sympathy or support from the association or the mining community.

But these isolated instances of bad faith afford no good reason for the determined opposition of certain valley men to debris dams, the Caminetti bill or anything else which will permit mining. They do not want to see hydraulic mining start again in any way, and are going to hold a convention in August to air their grievances and bring public opinion back into their direction.

It has been most unfortunate for the miners' cause at this critical period that certain individuals have continued illicit mining when they should not have done so. It has aroused the opponents of mining and given them an excuse to renew the old hostilities.

The miners generally never had, and do not have now, any hope of again starting up mining without first providing means for impounding their debris. But just as they are on the point of getting legal permission to build the structures necessary for this purpose, the opposition to the structures and to the mines takes shape and jeopardizes the whole thing.

The only difference will be that future generations will get the gold from the hills instead of the people now living. When those with the intense prejudices now existing have gone the way of all flesh, the sounder judgment of younger men will find a way to reconcile the apparent differences. They will then build the dams talked of now, get the millions out of the hills, and think what fools they were who left it for them. There is little doubt but that this will happen. It will take years for the prejudices to pass away, perhaps, but that gold will not always be left where it is known to be. People can raise crops of all kinds in the various States in the Union, but there is only one great known storehouse of gold and that is in the red hills of California.

Mexican Ores.

The steamer Signal brought to this city this week 550 tons of rich silver and lead ore from the Topia mines, Sinaloa, Mexico, to be worked at the Selby smelting works. This is the first of a series of monthly shipments of ore from these mines. Previously, all ore from the Topia district, which takes in 15 mines, went by rail to the Denver smelters. Diverting the ore to this place means the changing of just so much business from points east, and placing it in the hands of the merchants of this city. Over 1000 people are employed in and around the mines, and their orders in this case go where the ore does. The Gurney Mining and Milling Company of Culiacan, Mexico, have made a contract for the delivery at this port of from 500 to 1000 tons monthly of silver and lead ores.

A business man of this city who is interested in mines in Mexico said, regarding large quantities of ore being brought here to be worked, that this move of establishing a monthly ore steamer line meant a great deal for San Francisco, and that the Topia district trade, if it all came to this city, was worth from $50,000 to $100,000 annually to our merchants.

This is a very important matter, indeed, for our local smelting works and our city. The Selby Company is now in a position to handle satisfactorily large quantities of ore, and is to be congratulated on having the opportunity to get these Mexican ores.

The Mining Congress.

At Helena preparations are being made to receive the delegates to the National Mining Congress, which convenes there on July 12th. No pains or money will be spared to make the convention a success. The delegates will be handsomely entertained while there, and a special will take them to Butte, where a day will be spent in inspecting the mines. The drilling contest, in which eight prizes will be given to double and single-handed drillers, will be an interesting feature of the meeting. A trip will also be made to Great Falls to see the reduction works there, and Anaconda will also be visited.

Doubtless much of the time of the convention will be occupied with the silver question, as that was the case last year at Denver. There are some new phases to the subject now, however, especially the attitude of the great political parties as expressed in their platforms. The utterances are not at all agreeable to the silver men, since neither party was outspoken in favor of the white metal.

There are other matters, however, which will be discussed at Helena, which will interest miners all over the country. A number of delegates from California will leave on the 7th and 8th of July, and arrangements have been made with the railroads for half-fare to Helena and return.

The Silver Party of Nevada.

The Nevada people, like others in other mining States, show a decided intention of switching off from the old parties, considering that the subject of free silver coinage is paramount to all others. At Reno, last week, a convention was held, at which Hon. Thomas Wren of Eureka was temporary chairman. He spoke at some length, giving the history of silver since the Legislature of 1873 to the present time. His remarks were frequently interrupted by applause. He advised the people of Nevada to stand firm for silver, and shake off the shackles of the two old parties. Then committees on credentials, permanent organization, platform and order of business were appointed on the basis of two delegates from each county in the State. The convention then took a recess until 3 P. M.

The convention was called to order at 3:30 P. M., when O. C. Powning of Reno was elected permanent chairman. The committee on credentials reported that of 10 counties represented there were 198 delegates present. The committee also advised that no party not belonging to the Silver League have any voice in the convention. The committee on platform then read the following report:

The citizens of Nevada, representatives of the various silver leagues, irrespective of past party affiliations, in convention assembled, do set forth the following declaration of principles: First—We demand of Congress the full remonetization of silver and the free and unlimited coinage thereof at the present ratio of sixteen to one. Second—We are radically and unalterably opposed to the national Republican and Democratic parties on the question of the free coinage of silver, and we denounce the action of their recent national conventions as inimical to the material interests of the people of the United States, and especially to those of Nevada and all the other mining States and Territories; and we hereby repudiate the nominees of their conventions. Third—We pledge the nominees of this convention for Presidential Electors to support no man for President or Vice-President of the United States who is not unqualifiedly in favor of free coinage as defined by this convention. We refer to the Silver League of Nevada, now assembled, the right of directing said Presidential Electors for whom to cast their votes should contingency require.

A. S. FITZGERALD, Chairman.
B. F. CUSTER, Secretary of Committee.

Dr. Bergstein then moved that the party be known as the Silver party of Nevada. Carried. Three Presidential Electors were then selected, namely, Hon. Thomas Wren, Eureka; Hon. M. S. Bonifield, Humboldt; O. C. Powning, Washoe. Alternates—George Nixon, editor *Silver State;* Hon. George Brown of Storey county; Hon. J. W. Westfield, Lyon county. Twelve delegates to the Omaha convention were then selected.

Testing on Silver Ores.

HOT CREEK, NYE COUNTY, June 18 1892.

TO THE EDITOR:—I have been testing the MacArthur-Forrest process in a small way on the silver ores of this district and from a chemical point of view it is very satisfactory. I get from 85-100 to 95-100 from ores that do not amalgamate, raw, to any good percentage.

There is a question in silver ores which is of greater importance than the same question as regards gold, viz., quantity of cyanide used up.

In theory 32.6 pounds of zinc will precipitate 197 pounds of gold, or 108 pounds of silver, also in theory, according to ors writer in the PRESS a few weeks ago, it takes two equivalents of cyanide of potassium or 118.1 pounds of cyanide of potassium to hold 326 pounds of zinc in solution, hence the question, can the zinc be *cheaply* precipitated and the solvent be restored to use, or must we lose, say one pound of the cyanide of potassium for every pound of silver gained and one-third of a pound of zinc.

Although silver minerals will dissolve in cyanide of potassium, I do not think metallic silver will. For the last week I have had a small silver assay button, one-tenth of a grain, in the same kind of solution I used to test the above-mentioned ones, and the cyanide of potassium solution does not seem to affect it. It may not be small enough—the button.

I would like to draw out information from others better qualified to give it. Many silver ores carry certain amounts of metallic silver. R. G.

ANDREW FRASER, the well-known mechanical and mining engineer, for many years connected with the Risdon Iron Works of this city, has been murdered in Mexico, probably by his guide, while on a business trip to the Jesus Maria mines. He left Chihuahua on May 30th for the mines, and about 100 miles of the journey had to be made on horseback. It is thought that on his return he started with no one but the treacherous guide. Answers to telegrams sent by the Risdon Co. confirm the sad news. The body of the dead engineer was found buried in an isolated spot, and on being disinterred was positively identified. The guide has not been captured yet, but under the urgent orders of the Risdon people the best officers in Mexico are in pursuit of the murderer, and his capture is believed to be certain. The Mexican authorities have not yet consented to the removal of the body to this country. It is supposed that the motive of the murder was robbery.

Mr. Fraser was a thoroughly competent man and one well liked by his associates and those with whom he came in contact. He had special knowledge in mining and metallurgical machinery, and was the writer of the new circular on these subjects lately issued by the Risdon works.

JOHN M. ADAMS, of the firm of Adams & Carter, died last week while on a fishing trip up on the Klamath reservation in Southern Oregon. The body was brought back and the funeral took place in this city on Wednesday. Mr. Adams, as agent of the Frue concentrator, was well known to mining men all over this coast, most parts of which he had visited. He was a most enthusiastic and skillful angler and passed what leisure time he could in enjoying that sport. He was a man who had many friends, as he was of a social, genial disposition, good-natured and obliging. Everybody who knew Mr. Adams spoke well of him.

THE CYANIDE PROCESS.

A Method of Working Gold and Silver Ores Without Amalgamation.

THE MacARTHUR-FORREST SYSTEM OF TREATING ORES.

RESULTS OF TESTS AND EXPERIENCE ON GOLD ORES IN CALIFORNIA AND ELSEWHERE.

The Opinions of Mr. Paul and Mr. Aaron—Tests by Louis Janin, Wm. D. Johnston, Louis Blanding and Others—Mr. MacArthur's Description of the System—The Details of the Patents Granted—Working Gold-Ore Tailings in South Africa—Full Description of the Details of Operating the Process on Various Kinds of Ore.

The patented MacArthur-Forrest process originated in England, and the English metallurgists have had longer experience in the promotion of the process in other fields of operation, than tha Americans have had in thia country. The Gold and Silver Extraction Mining aud Milling Co., of Denver, Colo., introduced the process in this country, and put up extensive works whera practical working tests of ora are carried out. On the Board of Directors of this company are several Scotchmen, and a good many of tha shareholders reaide in Great Britain. Tha Denvar company controls the rights to the most important mining States and Territories of this country, and has organized subsidiary companies on certain desirable territory.

The first of these subsidiary companies was organized in Sbasta county, California, througb the exertions of Mr. A. B. Paul, and a plant has been erected at the Calumet mine. Mr. Paul describes, in this number of the MINING AND SCIENTIFIC PRESS, the results of some of the work accomplished by him in Shasta county. Before commencing work in this State, he visited the works at Denver and thoroughly tested the cyanide process on his Shasta county ores at tha laboratory and mill. The new mill of the Shasta Gold Extraction Co., in the same county, is also under Mr. Paul's management.

The Comstock Gold and Silver Recovery Co. is another of the subsidiary organizations. They will erect mills and purchase ore and tailings on the Comstock. Tbis field comprises Lyon, Storay and Ormsby counties, Nevada.

The California and Nevada Gold and Silvar Extraction Co., organized last March, covers the field of Esmeralda and Douglas counties, Nev., and Mono and Inyo counties in this State. Thera ara several old and important camps in these counties the ores of which have not been profitably worked, hut which can ba treated to a handsome profit on the new system.

In Arizona companies have been organized in both Maricopa and Yavapai counties. Three mills have been equipped in tha former county. In Utah the experience of the Marcur Mill is printed in this issue of tha PRESS and other companies are preparing to use the process. In Montana and Idaho tha system has been tried and arrangemants ara being made to put up several plants. In Colorado several mills are operating on the MacArthur-Forrest system. In the Black Hills district of South Dakota a plant has been erected, with steel tanks instead of wooden ones.

A number of contracts have also been made with individuals in Calaveras, Nevada, Eldorado, Amador and Los Angeles counties in this State, and in other Pacific coast regions.

The cyanide process is a system by which the ore, after being crushed by stamps or other appliances, is treated in tanks or vats with a solution of cyanide of potassium, by which the gold is dissolved. The solution carrying the gold obtained from tha ora is then passed through boxes or filters containing zinc and the gold precipitatad. Tha cyanide solution is then returned to a receptacle for repeatad use.

This in brief is the process now attracting so much attention among mining men. The great value of the process lies in the fact that the sulphurets are treated without saparation from the ore, at the same time, thus saving the usually subsequent operations of concentration, roasting and chlorination. All that is requirad for a plant is the crushing appliances and suitable outfit of tanks, boxes or tubs for the solution.

There are so many thousands of mines, the ores of which carry sulphurets which will not pay hy the chlorination process, when all the otber expenses are considered, that it did not take very long for the cyanide process to attract attention wben onca brongbt to public notice by practical tests on a good scale.

That cyanide of potassium would dissolve gold has long been very well known. In most standard chemistries, cyanide is mentioned for such a purpose; its properties are understood, and it is in daily nse as a gold solvent in certain arts. But ita practical applicability to matallurgical operations on a large scale has not been shown until very lately.

Whatever may be the merits of the controversy on the subject of pateut rights in connection with tbis process or system, there is no doubt of one thing, which is tbat the MacArthur-Forrest patentees deserve tbe credit of first introducing and practically applying, on a large scale, the cyanide process for working ores. As long ago as 1843, a patent was obtained for dissolving gold by cyanida of potassium under a certain process, and in that patent tbe inventor refers to previous patents in the sama line. And in tbis country, Jarome W. Simpson of New Jersey patented a process in 1885 which included the use of cyanide and another substance for dissolving precious metals from ores.

Tbis patent antedates the MacArthur-Forrest patent in this country, but is not exactly the same in description or claims. We have reproduced. from tbe official volumes of the patent office, the specifications of these patents, that metallurgists may know the exact wording of descriptions and claims.

It is not our purpose to enter into any discussions of the relative merits or valua of the patents, that being a matter which, in case ot conflict would have to be determined by judicial inquiry. That which intarests our raadera mora is the results obtained by the systam in itself, no matter wbo owns the patents. Tha original company in Great Britain sold its rights in this country of the MacArthur-Forrest patent to the Gold and Silver Extraction Mining and Milling Company, with headquarters at Denver, Colo., and this company has introduced the system, made tests, and sells the right to use its patents. What thesa patents are is shown elsewhare.

The miners of this country, with sulphuret ores of low grade, have long been on the lookout for a method which would displace that of chlorination. Not hut that chlorination returns a high percentage and is satisfactory from a metallurgical point of view. But it is too expensive for low grade ores. This cyanide process can, under certain circumstances, displace it, and permit the working of ores of a lower grade than those adapted for chlorination.

The cyanide process is not a universal panacea, but works with certain classes of ores, and those classas of ores are the most abundant in this State and elsewhere. Where there are certain metals present it does not do well. But in most instances it appears to accomplish the object at a less cost than the processes previously in vogue.

During the past few months the MINING AND SCIENTIFIC PRESS has publishad more or less news concerning the working of this process. The result has been that we are in receipt of hundreds of latters from all parts of the country asking for further information. This shows the great interest which has been aroused in the system, and it is for that reason that wa publish this week an extra number devoted almost entiraly to consideration of the cyanide process. It was our intention to print in one number all that might interest the miner or millman on this subject, and it is hoped this is accomplished to the satisfaction of the readers.

Of course we understand very well that new processes come to the front occasionally which in a few years or months disappear from sight; and we understand, too, that many of them are founded on laboratory experiments, the promises of which are not always borne out by subsequant experience on a large scale.

But it must be confessed in this instance that the process has gone far beyond a laboratory experiment, and in one case, at least, works capable of treating 75,000 tons a yaar are in operation, which last year yielded from tailings nearly 20,000 ounces of gold. And this at a mine which is one of the best equipped for treating ora in the world. Any process which can show such a result would be worthy of investigation by miners elsewhere. But not only that, for there ara other works in operation in different parts of the country naarer at home, the managers of which all speak favorably of the system as worked by them. Again, well-known metallurgists who have investigated tha process, endorse it for certain classes of oras, and these classes, as stated, ara those which we have most abundantly.

There are those who are inclined to belittla tha whole thing because it has long been known that cyanide was a solvent of gold. Others because thay know of previous patents and previous experiments in tha same general direction. But in no other case than the present was the process pushed to a successful introdnction on a large scale. Experiments were made, it is true, and the results published, but they attracted little attention. In other cases caveats wera filed but the possible patent never applied for. Still again whera patents were issued their owners did nothing toward practically introducing their systems.

Now, however, that a company has worked ths system to a successful issue and hrought it to general notica so that inquiry is aroused and tests and terms asked for, those who have dona nothing are inclined to "back-cap" tba process and throw doubt not only on the patents but tbe practicability of the process itsalf.

It is very certain, however, that if tbere were not some merit in the system, when properly applied, the failure would have been found out by this time. That there bave been failures is true, but as we have stated, tbe process is not adapted to all sorts of ores.

At all events, sufficient success has heen proven by those who have put the process to practical tests on a large scala to induce others to experiment also. If a man has ore to which it is not suited, it costs very little to find this out, and ha need put up no expensive works on any one's mere say so. He can take his ore and see the tests made himself, if he chooses, as others from this Stata have done, at Denver.

There is plenty of opportunity for investigation before taking any definite steps toward arranging a plant, and if one makes up his mind the process does not suit bim, he can keep on as he is doing now.

It has been our endeavor to bring together in this issue of the PRESS as much general and detailed information as is available on this subject. Most that is printed is from the pens of men well known in the metallurgical and mining world. Their names are given so that the writers may be known. This number of the MINING AND SCIENTIFIC PRESS will be useful not only for casual reading, but for raference at any tima.

THE EXPERIMENTS IN CALIFORNIA.

MIDDLE CREEK, Shasta Co, June 4, 1892.

TO THE EDITOR:—It heing generally known that the Calumet Company was the first to introduce the MacArthur-Forrest process into California, on any practical working scale, my time has heen considerahly taxed in answering letters from very many mining men, not only in California, hut elsewhere, all inquiring as to the practicahility of the process, etc., etc. Seeing so many are interested, I have concluded to write a description of it, giving data so many desire, and let you publish it.

To preface, the process was first promoted hy the Cassel Gold Extracting Company of Glasgow, Scotland; from there it was introduced into Australia, South Africa, New Zealand and the United States. The patents for this country are held hy the Gold & Silver Extracting, Mining & Milling Company of Denver, Coloradn, of which ex-Senator Tahor is president, and Colonel T. L. Wiswall, secretary. This company was formed some two years ago, but little progress was made, however, until within the past year, and since the Denver company completed their 15-ton mill and commenced working ores, which gave such unexpected and satisfactory returns, in the way of high per cent, that every investigator was filled with wonder, and saw the revolution likely to follow.

On my attention heing called to it, now one year ago, I at once started for Denver, and was allowed all the desired privileges for a close investigation. The more I investigated, the more merit the process presented, and I soon became convinced that it was worthy of more than a passing consideration; in fact, in my own mind, concluded to "sail in" and find out all ahout it, on practical working of our own ores. Returning to California, I commenced a series of experiments, agreeahle to instructions received in Denver from their leading chemist, and soon made hetter results on our ore than made in Denver. It now took no time to decide as to the propriety of introducing the process on a large scale in the Calumet mill, under my management, and where it is now doing satisfactory work and heing extended, and will be up to 100 tons a day.

It may he information to many to state that in South Africa 13 mills are now operating the process with great success, and that mills are already in operation in Colnrado, Utah, Montana, Dakota and California. At the Needles, in San Bernardino county, a 100-ton mill is in course of erection. Being among the first in this country to accept its merits, I fancy, hy this time, I know something ahout it, and hence presume to speak.

The MacArthur-Forrest process is the use nf a weak solution of cyanide of potassium. The strength of cyanide should be, as testing your ore will show, the proper per cent for extracting the highest per cent of the precious metals, say from one-half nf one per cent to one and one-half, then treating your ore for a given length of time with

this solution; time for treatment according to the character of your ore and metals; how much hase and what kind. To get at this correctly, a few tests are necessary; hut it is easily worked out. And here, it is proper to state, that time is more the factor of per cent than a high per cent of cyanide. You never want to use a high per cent, as this speedily attacks the base metals, while a lower per cent attacks the gold and not the hase, hence the lowest per cent you can use to get the gold, the hetter. We have made many tests on this point, and all clearly establish this fact. I have failed in per cent of extraction on some ore, and then hy a few experiments, gained high per cents from same. It is a process of study, but once you get time and per cent determined, then there is no failure in your extraction from that especial ore, no matter to what extent you may go. So true has this heen with our working, on a small and large scale, that taking any ore, from any mine, I would not hesitate to huild a 50-ton mill on a simple test of 50 pounds, if the per cent of extraction was satisfactory.

There are two modes of having action from the cyanide on the ore; one is hy agitation, and the other is by time and percolation.

Agitation of ore in the solution, more speedily dissolves the gold, at the same time it triturates the material, so as to make slums, and thus what is gained hy agitation you lose when filtering the solution. Revolving harrels, or settlers, as used at times in silver mills, make good agitators. The percolating plan is the use of large tanks, whereby the ore rests in the solution, and in time is percolated off into reservoirs. Agitators take attention and power; percolation, less attention and no power; hesides, agitated material must be discharged into filtering tanks and allowed time to draw off. At Calumet, we first used agitators as per instructions, hut after trying percolating, gave it the preference, and are now pushing for enlarged capacity on this plan. This mode of working is heing generally adopted in South Africa, presumedly hy Mr. MacArthur's instructions. From my S. A. correspondent, I learn they are now constructing all mills for this way of operating the process. The new mill of the Shasta Company is also changing to the percolating plan. The Mercur mill of Utah was the first, in this country, to start on the percolating plan, on a scale of 30 tons per day, and made a hig success from the very start. All percolated solution, whether from agitators or tanks, contain cyanide, gold and silver in solution; consequently, all vessels receiving the same should he perfectly tight, as you presumedly are handling valuahle liquid, and for this reason iron tanks are to he preferred to wooden. This percolated solution is now transferred to the precipitating hox, of size according to value of ore and quantity to be treated. The hox used at Calumet is 14 feet long, with 14 apartments. These hoxes have wire screens on the hottom, and are filled with zinc shavings four inches deep. The hoxes are so constructed, that the solution is made to pass through the hody of shavings, which precipitates the gold and silver in a dark, blackish powder. By this part of the process, a given part of the zinc is destroyed; hut this is of no particular moment, as the loss is hut trifling in dollars and cents. The Calumet Co. are soon going to change these wooden zinc hoxes for white iron-stone chinaware, as made by the Toronto Pottery Works, Toronto, Ohio. Wood ahsorhs too much gold and cyanide.

The process is very simple and easily worked, when you have your plant right, and start right on the per cent of cyanide and time for your especial ore. It wants, however, to he handled intelligently, and it requires something more than mechanical skill to operate it properly. It is a process where brains and knowledge do not come in competition with "influence" or muscle. As to reducing ore, it is as yet an unsettled question whether it is hest to crush wet or dry, all points heing considered. The majority of the mills are crushing their ore dry. The Calumet Co. has started out on a new lay, which I think will he the winniog one; to wit, crushing by stamps, and running the cyanide solution through the battery instead of water. In other words, crush your quartz in the solutioo; thus you combine agitation, percolation and expedition.

This, though a new deal, suits us, and thus far no disadvantages present themselves, that override the advantages gained. This plan has been in operation over four months, with no discouraging features, while several additions have materially improved the plan. Of course you have to keep pumping your solution hack, and running rouod. For dry reduction, the Shasta Co's mill uses pulverizing harrels. The advantage gained hy the use of harrels is, all the ore is of equal grain, and, as you do not require fine crushing for this process, hy uniform grain of ore you do faster percolating. Time, however, is the essence of per cent more than fine crushing. As to the cost of working the process, there is a good deal to know before this question can he correctly answered; to give some idea, will say from $2 to $5 per ton. You can extract the gold and a high per cent of silver from the great majority of ores. The question is as to time, and at what per cent of cyanide. There is a very erronenus idea as to the cost of cyanide, and it is well to now correct it. 98–99–100 per cent cyanide costs in New York 50 cents per pound, F. O. B., as all can be assured hy addressing the Roessler & Hasslacher Chemical Co., 73 Pine St., New York.

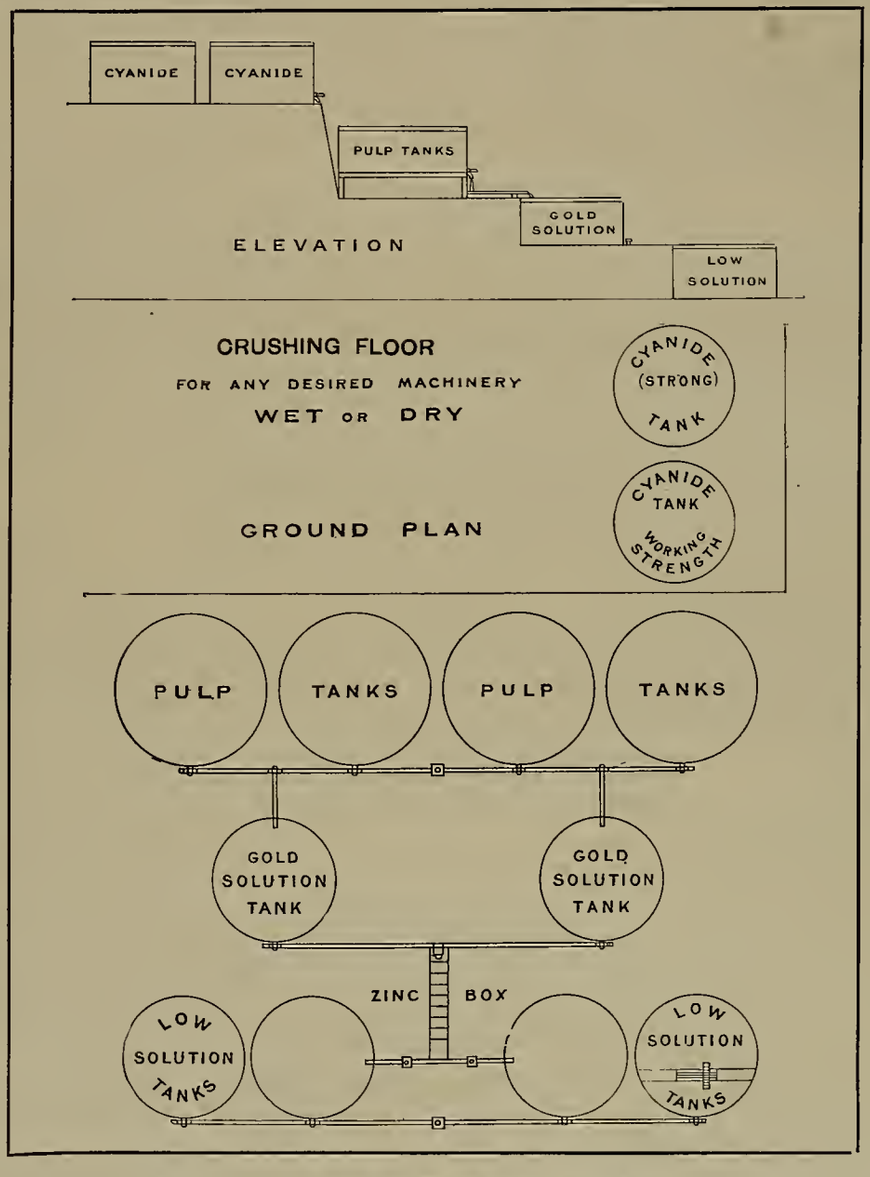
As to silver extraction, at first I paid no attention to it, but have found the process very efficient, except requiring more time than gold; yet silver is in so many combinations that testing should he the only guide for any especial ore. It will work readily all ores worked hy pan amalgamation. Taking California ores, from some it will often extract more silver than the total cost of milling. Yet it is not to be considered that every ore containing gold and silver can he profitahly treated hy this process. The most objectionahle ones are those containiog a goodly per cent of copper. As to cost of plant, for gold it is very much cheaper than the ordinary first-class mill; for silver, the expense will not he half the cost of pan mills.

To express myself as to the process will he to declare it one of the wonders of the times. I am aware that it has not the friendship of some men of science, who talk wisely on what they don't know. To me, all opposition is as a puff of wind in the face of every day demonstrated facts as I handle the process. I have heen cursed too often by disappointments in yields, hy our old systems, to not appreciate the fact of always heing sure of a high per cent of the value of the ore I treat.

One of the astonishing features of the process is, that you can take the heaviest sulphureted ores, and, without roasting, extract 95 per cent of the value out of the same, and then you cannot detect any perceptihle difference in their appearance. This was the hardest part for me to realize, hut I have long ago gotten over the douht, hut not the wonder.

One of the inviting features of the process is that all the machinery you want is for reducing your ore, and power to drive it; and what a comfort there is in this, every millman can realize. Then, coupled with the fact that your returns are certain, a wise man can grasp the future of mining. Thus I give the reader some idea of what the process is. Of course there is more or less detail, which can only be gained by practical manipulation of it.

ALMARIN B. PAUL,
Gen'l Man'g'r Calumet G. M. Co.



MR. PAUL'S CYANIDE PLANT IN SHASTA COUNTY, CAL.

At the request of the editor of the MINING AND SCIENTIFIC PRESS, Mr. A. B. Paul has made a sketch showing plan and elevation of plant for working ores by the MacArthur-Forrest process.

THE LIXIVIATION OF ORES WITH CYANIDE SOLUTIONS.

SAN FRANCISCO, June 25, 1892.
TO THE EDITOR:—I refer to that which is known as the MacArthur-Forrest process.

In the earlier working of this process the finely powdered ore was agitated, with the cyanide solution, in revolving harrels, or in pans, and, after a certain number of hours, was passed to a filter vat, drained and washed. This plan is generally giving place to simple percolation in filter vats which are made of sheet iron, or steel in some of the mills.

It is one of the advantages of the process that it admits of the use of iron vats, tanks, pipes, pumps, etc., hut hrass must he avoided. The iron vessels should he coated with a mixture of coal tar and asphalt, put on as hot as may be, not hecause the chemicals act directly on iron, hut hecause the iron will otherwise rust rapidly.

There seems to he no reason why wooden vats and and tanks should not he used, as, in fact they are in some mills; they also should receive a coat of tar and asphalt, inside at least, to prevent excessive ahsorption of the solution, or I think paraffin, well soaked into the wood hy means of heat, would he as much superior to tar in effect as it certainly would in appearance, hut it should he tested first to ascertain if it will permanently resist the solution, which no ordinary paint, white lead or lac varnish will.

An improvement introduced as to this process hy Mr. A. B. Paul, though long in use in silver lixiviation, is the discharge of the vats hy sluicing the sand out, through a gate, to a launder, in which a stream of water flows. Mr. Paul's gate is very simple, consisting of a cast iron frame, with suit-

able lugs for securing the closure, bolted to the side of the iron vat, from which a corresponding piece has been cut out. The closure is simply a piece of pine board with a gasket of blanket on the seat. The filters are like those used in the chlorination process, or in lixiviation of silver ores, hurlap on a perforated false bottom or a grating. The lixivium flows out from below the filter through an iron faucet, for which I think I should substitute a small nipple with a piece of soft rubber hose attached, into a launder, and so to a sump, whence it is drawn as required by an iron pipe to the precipitating boxes. The launders are sometimes made of boards nailed together, which is bad; they should be of sheet iron, tarred, or of wood pipe ripped in two and tarred inside; also they should be covered to exclude dust, etc. So far as the process is understood as yet, it would seem desirable to avoid unnecessary exposure of the solution to the air by allowing it to drip or flow from a height carrying air with it, into the liquid already in the receiving vessel, or to fall with a splash into a launder, etc.

Another good point in the process is that very coarse crushing answers for many ores, the extra time occupied by the extraction being fully compensated by the economy in crushing, and the saving of time in the draining and washing, owing to more rapid percolation. At the Calumet mill they crush wet through a 30-mesh screen, whereas much higher numbers were necessary for amalgamation; this, however, depends on the structure of the ore. If the metal to be extracted is diffused in grains through a compact gangue, fioe crushing is a necessity; but if it is in streaks, veinlets or seams, or if the gangue is very porous, coarse crushing even to the size of a pea may suffice.

When very fine crushing is required by the nature of the ore it may be best tn use the method of agitation in barrels, etc., but then the filter press should be employed to separate the liquid well and quickly from the pulp. In default of the filter press, filter vats and suction, either by fall or by pumping, may be resorted to. With ores which yield much slime, the coarser portion, or sand, may be separated and treated by percolation, and the slimes by agitation and the filter press.

The extraction of coarse gold by this process is not feasible. Where such gold occurs in conjunction with fine gold or auriferous sulphurets, I think it would answer to crush wet and amalgamate in the battery, passing the tailings into the percolators, which must be provided with overflow pipes or launders to conduct the excess of water to a sump whence it may be returned to the battery. If the ore is such as to require a preliminary treatment with lime or caustic soda, etc., these may well be put into the battery with the ore. Where such treatment is not required the cyanide may be put into the battery as is done at the Calumet mill; this may, however, slightly iocrease the deterioration of the cyanide by atmospheric action.

I believe Mr. A. B. Paul originated the method of putting the cyanide iotn the water used in the battery. He also added lime, but has given that up. I doubt if his ore requires lime or alkali, but I shall recur to the matter in the course of this article.

As to the means of crushing, it is with this as with all lixiviating or leaching processes, the more equal in size the particles are, the better, hence, those machines which give the best result in this respect are, other things being equal, the best for the purpose. Dry-crushing stamp batteries are notoriously defective in this regard, though there is an arrangement which I have described before, and which I cannot take time to describe here, by which the defect may be in a measure obviated. I think, however, that wet crushing will be generally adopted as it has much in its favor, and not a particle of ore need be lost where it is used. Where the quantity of slimes is not large, such portions as may still settle in the sump may be transferred periodically to a special vat aod treated at leisure.

It is not necessary to separate the sulphurets for special treatment, hence, in a case like that at Calumet, the manipulation is extremely simple. It is only necessary to crush the ore suitably, flow it into filter vats, allow the liquid to percolate for a sufficient length of time, and finally sluice the ore out of the vats. What though it may require four or six days to treat a charge? Vats can be made to contain 100 toos of ore and solution. At the works of the Robinson Gold Mining Co., Limited, in South Africa, they have recently increased their plant by the addition of 12 vats of 2000 cubic feet capacity each for the treatment of tailings. A set of vats properly cared for will last a lifetime, consuming nothing more than an occasional coat of tar. And there need be no hurry nor worry; if a workman or two should leave unexpectedly the work will not be at a standstill, for almost anything in the shape of a man, or even a woman, can do the work under proper direction, so little is skilled labor required. It is the most *comfortable* process to conduct that I know of, but a good assayer is required, and if he is also a fair chemist so much the better.

The precipitating box is a wooden trough about a foot wide and deep, closed at the ends and furoished with a cover. The length is, at Calumet, from 12 to 16 feet divided into about a dozen compartments by partitions which alternately extend to within an inch of the bottom and within several inches of the top. In each compartment is a tray or box with sides of wood, the lower edges furnished with sheet rubber gaskets tacked on; the bottom is a seive of iron wire with 8 or 10 meshes to the liuear inch. The upper part of the box fits snugly in the compartmeot, the sides being drawn in or tapered toward the bottom to facilitate removal by means of a bar of wood fixed across the top as a handle. The lower edge rests on a ledge or rabbet and by means of the rubber gasket makes a tolerably close joint. The solution passes alternately upward aud downward through the seives or trays, flowing over and under the respective partitions.

Zinc shavings are placed in the seives and upon them the precious metal is deposited. At suitable times the trays are removed, one by one, and shaken in a pan of water, when the precious metal, in the fnrm of a black powder, together with particles and shreds of zinc, pass through the seive. The tray is replenished with zinc shavings taken from another tray nearer the tail end of the trough, and replaced. Fresh zinc is charged into the last trays of the series, of which the contents have been transferred to the preceding trays. The reason for this is that the gold, etc., is deposited more rapidly on zinc that is already coated with gold than on clean zinc. The mixed gold, silver, and zinc in the pan is then sifted by a wire seive of 60 meshes to the linear inch to separate the coarser particles of zinc, these being placed on top of the shavings in the first tray. The precious metal is then washed, dried, and melted in sand-pots, with fluxes adapted to slagging off zinc, copper, if present, and other impurities. The liquid leaving the box retains a little dissolved gold which is not lost because the liquid is used again.

At Calumet the precipitating boxes are of naked lumber. I should think they would be better if well paraffined, or, perhaps, black varnish might answer. Mr. Paul is going to have trays of porcelaio, the advantage of which is not obvious to me. The entire apparatus might be of iron.

The zinc shavings are made at the Calumet mill from the cases in which the potassium cyanide is received, which are made of sheet zinc. The sheets are cut into discs of about six inches diameter, each with a hole in the center of about three-fourths inch diameter. The discs, to a number sufficient to make a cylinder or cheese about four inches thick, are placed on the iron spindle of a simple lathe driven by a belt, and are held firmly by being compressed between two discs of iron. As the spindle revolves, a cutter, just wide enough to take all the zinc discs while clearing the iron, is pressed against the cheese and takes off a thin shaving which consists of as many strips as there are sheets of zinc io the machine.

A statement which has excited some surprise is, that a sample taken from the upper stratum of the charge of ore in a vat, at any time during the progress of the lixiviation, correctly represents the entire charge as to its assay value. I think this is explained by the fact that the precious metal dissolves so slowly that the percolating liquid is never even approximately saturated; thus the action is practically equal throughout the mass, and there is at no time an appreciable difference between the upper and lower portions.

At Calumet, the lixivium is circulated; that is, the liquid which has passed through a charged vat is not passed at once to the precipitation, but pumped up and returned to the vat, being at the same time reinforced by an addition of cyanide so that it contains 0.60 per cent, the original strength having been 0.50 per cent as it went to the battery. Not solid cyanide, but stroog solution from a special vat, is used for the reinforcement. When the assay of a sample of the pulp shows a sufficiently close extraction, the liquid is allowed to subside to the surface of the ore, and is followed by a sufficient quantity of water, which is allowed to drain out and pass to the stock solution, compensating loss by evaporation, etc. I regret that I cannot at present give statistics as to cost of treatmeot and percentage of extraction. As I do not care to offer these at second hand, I must refer the reader to those who know all about them.

I now approach a difficult part of my subject. The cyanides have not received so much attention from chemists as have many other compounds; with special reference to the treatment of ores they have scarcely received any, hence the chemistry of the process is not very well understood by metallurgists; at least, very little that is of value can be found on this subject in the standard works. What I say must therefore be understood to be, to a great extent, only my present opinion, subject to correction as experience may afford more light, or as those who know more about the matter may come to the front. I will remark, however, that the subject is complex, and the chief use of theoretical considerations must, for a time, be to suggest, guide, and to some extent limit experiment which is the court of last resort.

It is an old story that solutions of certain cyanides can dissolve not only many metal compounds, such as silver oxide, chloride, etc., but also several of the metals themselves, in the metallic state, notably silver and gold. Attempts have been made, from time to time, to apply the cyanide solutions to the lixiviation of ores, but with little success unless recently. The keynote of the present process is the fact that extremely weak solutions, acting through considerable periods of time, give the most satisfactory results. The precipitation of gold and silver from the cyanides by means of zinc has long been used by photographers; it is in the specially advantageous form in which the zinc is applied that an advance has been made in this direction. Some attempts have been made at Denver to apply electrolysis to the recovery of the gold and silver extracted from the ore, and, although these attempts did not succeed, I think electrolysis will finally be adopted.

There seems to be a difference of opinion as to the chemical reaction by which metallic gold and silver are dissolved, some saying that access of air is essential while others deny that. I have not yet had ao opportunity to investigate this, which, however, I thing would not be very difficult, because if pure potassium cyanide in pure water can dissolve a metal, it would seem that hydrogen must be evolved and potassium hydroxide formed. Mr. Louis Janin, in an article published in the *Engineering and Mining Journal* of December 29, 1888, on *Cyanide of Potassium as a Lixiviating Agent for Silver Ores and Minerals*, expressed the belief that hydrogen was evolved from the surface of a piece of silver exposed to the action of a cyanide solution. The action is so very slow that it will require some time and patience to settle the question which may have a practical bearing.

There is also a want of agreement as to whether the gold in ores is ever in other than the metallic state, though it is generally conceded that true tellurides of gold exist. Mr. Henry G. Hanks however, has expressed the opinion, based on experiment, that the gold in the so-called tellurides is really metallic.

Be this as it may, the process seems to be able to extract the greater part of the gold from many ores, also the silver, though not so well, usually. By the use of weak solutions the extraction of base metals is reduced to a minimum; yet, as the copper sulphide is soluble in a solution of potassium cyanide, it results that some ores yield a portion of copper which is precipitated with the precious metals on the zinc. It is said that copper oxide also dissolves.

Ores which contain, or have contained, sulphurets which have become partly or wholly oxidized usually receive a preparatory treatmeot, the object of which is the decomposition of various metal-salts, the neutralization of acid or removal of certain oxides, as those of lead or zinc, which would otherwise decompose the cyanide solution or obstruct its action. This consists in subjecting the pulp to the action of lime-water, or of a solution of caustic alkali, by means of percolation, etc. In some cases carbonated alkali, as ley of wood ashes, would probably serve the purpose, though I have not yet heard of that being tried. The preparatory treatment sometimes occupies 36 hours or more, and in some instances costs more thao the extraction A private letter from Africa says that three months of experimenting were necessary in one mill to find a suitable method of preparing the material—tailings—for the extraction; unfortunately the cause of the difficulty, and the remedy, were not stated. "Practical men" may be interested in knowing that it was a *chemist* who fioally solved the problem. I suspect that some cases may require acid instead of alkaline washing, or perhaps acid first and alkaline following.

A disadvantage of limewater is the extremely slight solubility of lime; this might perhaps be remedied by mixing lime with the ore, either in wet or dry crushing, in more than sufficient quantity to saturate the water, then as fast as the dissolved lime should do its work a fresh quantity would dissolve, and so on; but if this were done, either the excess of lime must be completely washed out, or, results will follow on the application of the cyanide which, will be considered shortly. Hot limewater has been tried but did not answer so well as cold; probably the advantage of heat was counterbalanced by the diminished solubility of lime in hot water. As the presence of common salt increases the solubility of lime, I suggest a trial of it.

It has often been suggested that the caustic alkaline and cyanide solutions might be applied simultaneously, that is, the lime or caustic alkali might be added to the cyanide. This may answer in some cases and not in others, depending on whether the cyanide or the alkali, etc., would act most promptly on the deleterious substances. If base metal cyanides should be formed, which the alkali would not decompose, a loss of available cyanogeo would result,

and this loss would be greater in the case of the soluble metal-cyanides, such as those of zinc or copper, than with the insoluble ones, because a metal which forms a soluble compound not only decomposes an equivalent of potassium cyanide, but also combines with another equivalent, withdrawing that also from the field of utility. As to iron, it appears from the article by Mr. C. W. Merrill, republished in the *Press* of April 25th last, that ferrous cyanide is decomposed by caustic alkali, which means that the useful alkali cyanide is regenerated in that instance.

I have mentioned that in the Calumet Mill the cyanide is used in the wet crushing of the ore; until recently lime was also added, in pursuance of the idea of dispensing with a separate preparatory treatment. That the extraction was satisfactory does not prove that the principle is correct; it must first be shown that the ore needed such treatment, which I doubt.

But, granting that the ore did require something of the kind, let us see what would be the effects of putting lime into the battery with the cyanide solution. In the first place, it is very doubtful if the lime could perform its function instantaneously, except as to soluble sulphates of copper and iroo, not as to insoluble hasic salts which would be likely to exist and would yield but slowly to the action. Also, it will be readily admitted by chemists that the quantity of the lime could not be accurately adjusted to the requirement, hence an excess must he used; in fact five pounds of lime were added for each ton of ore.

Commercial cyanide contains a quantity of alkali carbooate, which caustic lime changes to caustic alkali with simultaneous production of insoluble calcium carbonate; so far then, we find we have caustic alkali to complete the work for which the lime was used, and it would be much the more efficacious, at least as to some substances. But the lime is added continually with the ore, while the sodium carbonate is only added at long intervals in the added cyanide, hence the lime is almost sure to be in excess of the sodium carbonate, at least temporarily, perhaps permanently. In working ten tons of ore per day, 50 lbs. of crude lime, equal probably to at least 25 lbs. of pure lime, were used; in the same length of time, 18.6 lbs. of cyanide of 70 per cent purity were used, which could not possibly have contained more than 5.58 lbs. of sodium carbonate, and certainly did contain less, because of other impurities; say it contained 4 lbs.; this would leave the lime largely in excess permanently. The next effect of the excess of lime would be, to decompose potassium cyanide, forming calcium cyanide, which may be just as good, and caustic potash. Thus we see that lime produces caustic alkali in the solution. What may be the effects of that?

At the Calumet mill, the results are not known to have been deleterious, and on the other hand, the abandonment of the use of lime had not, at last accounts, produced any bad effect, but the inventors of the process have cautioned operators against the presence of caustic in the cyanide, claiming that it does harm. With ores, like those of the Comstock, containing sulphantimonides, caustic alkali produces alkali sulphide, and it has been stated by some that alkali sulphide interferes with the precipitation of the gold. Caustic alkali will also dissolve the oxides and sulphates of lead if present, and many other substances the effects of which on this process I do not know. Thus, those who are waiting for Mr. Paul's results, in order to follow his example, should remember that what may suit his case may not suit theirs. One effect of caustic alkali must he to increase the consumption of zinc.

In whatever form the lime may exist in the solution, except a trifling quantity of sulphate, it will constantly fall out, wherever the liquid may flow or remain, as calcium carhonate, causing some inconvenience; and unless there is some special advantage in the use of lime it would seem hetter to use caustic alkali. This, it must be understood, applies only to the use of the lime in conjunction with the cyanide, as was done at Calumet; it has no bearing on the use of lime-water in preparatory treatment if the ore is washed before applying the cyanide.

I will now show how the presence of caustic alkali, whether produced hy means of lime or added as such, may be beneficial; also that it is prohahly impossible to work the process without producing at least a small quantity of caustic.

Carbon dioxide (carhonic acid gas) is always present in the atmosphere, and it has the property of displacing cyanogen from the alkali and alkaline earth cyanides, forming prussic acid which gradually evaporates. This causes the odor of potassium cyanide. But if caustic alkali is present it takes the carbon dioxide and is converted into alkali carhonate, prussic acid is not formed, and cyanogen is not lost; or, at least, if prussic acid is formed, it is instantly neutralized hy the caustic alkali, and an alkali cyanide is reproduced. These reactions may be thus expressed:

$$2\,KCN + CO_2 + H_2O = K_2CO_3 + 2\,HCN, \text{ and } 2\,HCN + 2\,KOH = 2\,KCN + 2\,H_2O.$$

If calcium is present as lime dissolved in the liquid, it will combine with the CO_2 whether caustic alkali is also present or not, formiog insoluble calcium carbonate; and if it is in the form of calcium cyanide, resulting from the action of lime, as before explained, it will still combine with CO_2, with or without evolution of HCN and consequent loss of C_2N_2, according to whether caustic alkali is present or not. Thus we see that caustic lime or caustic alkali in the liquid protects the cyanide from the decomposing action of atmospheric CO_2. As to caustic lime, however, that cannot probably be present until all the potassium cyanide has been decomposed while an excess of lime remains.

I have said it is probably impossible to work without the production of caustic. Whether or not the gold in dissolving produces caustic, as I think it must, it is a fact that hydrogen is evolved in the precipitation box, and that means that zinc dissolves, forming zinc cyanide and caustic potash (or lime, as the case may be; the lime would make caustic soda as soon as it should come in cootact with sodium carbonate from the impure cyanide added daily). I do not think that pure zinc can decompose pure potassium cyanide in solution, at least not rapidly, until some caustic has been formed, but as soon as iron or gold is placed in cootact with zinc in a cyanide solution, pure or not, a brisk evolution of hydrogen begins, and every chemist knows what that must imply. In the precipitating box the zinc is in contact with both gold and iron, the gold which is precipitated on it, and the iron sieve on which it rests. I saw the mass of zinc shavings actually lifted to the surface of the liquid by the floating effect of the hydrogen.

There are some interesting facts connected with the precipitation of metals from the cyanide solution. I examined some of the precipitate from the mill, which consisted of gold, silver, copper, calcium carbonate and other substances, including fine shreds of zinc. To my surprise the copper dissolved with effervescence in dilute hydrochloric acid, which proved that it was not in the metallic state; it also dissolved, at least partially, in dilute sulphuric acid. The gas evolved was without distinctive odor, and the solution by hydrochloric acid contained cuprous chloride, as shown by the formation of oxychloride in the neck of the funoel and on the surface of the liquid. I did not remain at the works long enough to investigate this matter, but Mr. T. E. Eichhaum, the chemist there, has sioce verified the facts and made further observations, not only in this regard, but also as to the precipitation of the precious metals.

Another circumstance which I observed, and which Mr. Eichbaum has also verified, is that zinc does not precipitate copper from a solution made with potassium cyanide of 98–99 per cent purity, nor does it cause evolution of gas. On adding metallic iron, in contact with the zinc, a brisk evolution of gas takes place, yet copper is not deposited. If, however, the solution of copper is made with the impure cyanide used in the mill, copper soon makes its appearance on the zinc. The latter fact is reported by Mr. Eichbaum, and I am not sure whether or not he found an addition of caustic necessary to the effect, which is important, because, though the mill cyanide certainly contaios carhonate, it does not seem to contain caustic.

The lixiviating solution is assayed daily for available cyanogen as represented by percentage of pure potassium cyanide. This is done hy means of a standard solution of neutral silver nitrate which is delivered, by means of a hurette, into a measured quantity of the liquid, to be tested. As soon as turhidity ensues in the liquid, the hurette is read, and a simple calculation shows the percentage strength in potassium cyanide, or its equivalent in sodium or calcium cyanide. Metal cyanides, or metal and potassium, etc., double cyanides which may be present, do not interfere; hence, the process does not show the entire quantity of cyanogen present, but only that which is in a useful condition, which is what the operator desires to know.

The rationale of the assay is, that while silver cyanide is insoluble in water, and in solutions of such suhstances as may he present in the liquid, other than free cyanide of potassium (solution or calcium), yet it is soluble in that, hence cannot form a precipitate until that is all disposed of; the quantity of silver nitrate consumed before a precipitate appears, is, therefore, the measure of the available cyanide present. The necessary reinforcement is made by adding a measured quantity of concentrated solution of cyanide, of known strength, to a known quantity of the stock solution in a tank.

What becomes of the zinc which continuallly goes into the solution? This question is often asked. I have a certain suspicion on this point, hut for the present will only say that the zinc does not appear to have caused any inconvenience thus far, though the solution has been used constantly for many months, it is said for a year, without other renewal than the daily addition of cyanide and water to make up for loss. Owing to this addition of water the stock solution can never become saturated with zinc, the accumulation of which cannot pass a certain maximum; the same is true of the alkali carbonate which, in the absence of lime, must be constantly forming.

The effects of these substances, as well as of others which may be in the crude cyanide used, and of yet others which may be added if desirable, will form an interesting study which may lead to a means of increasing the efficiency of the process, especially in the extraction of silver. There is also room for improvement in the form of precipitation of the precious metals, and for the exclusion of base metals and other impurities by which they are often contamioated.

It is said that zinc and copper may be removed from the solution, and alkali cyanide regenerated, by means of an alkali sulphide; this has been doubted, at least as to copper, because of the solubility of copper sulphide in solution of alkali cyanide. It may be that in the weak solution used, the copper sulphide may form and may endure long enough to enable its removal.

I must say I expect to hear of maoy disappointments as to this process, though but little harm need result if those who may think of adopting it will first have it thoroughly tested with regard to their particular ore. It should not be supposed that all ores of precious metal can be treated successfully in this way, nor that it will have the advantage of relative economy in all cases. There are instances in which gold quartz is mined and milled profitably on a yield of $3 per ton or even less, the cost of milling being often as low as 40 cents per ton; the lowest estimate I have seen of the cost of this process is $1.50 per ton, under favorable conditions, clearly then it must save at least $1.10 per ton more in such a case than common milling, or there must be a relative loss. It is of no use for enthusiasts to exclaim and protest that it will do this and more; it must be proved by trial in each particular case, at least until we shall know more about the subject than we do now.

Nevertheless, I think there is a wide field of usefulness for the process, even now, in the treatment of material, whether original ore, tailings, slimes, or concentrates, in which the gold exists in very fine particles. Some assert and others deny that the so-called tellurides yield to the process, and I have not heard of a satisfactory result from ores of which a large part of the value was silver, excepting some of Mr. Janin's results as reported by him in the article referred to above, and lately as to Comstock ores which have never been considered as refractory, and from their composition would seem likely to yield to this process.

This article is not written in the interest of Messrs. MacArthur and Forrest, nor in that of any of their representatives, but in response to a general demand for ioformation and opinions in regard to the treatment of ores by means of cyanide solutions, regardless of the claims of the alleged inventors or patentees, with which I do not occupy myself. Personally, I should prefer to see the metallurgical field untrammeled hy patents—unless I could get a good patent myself—though if this process had not been patented many who may use it would never have heard of it. Moreover, people are very apt to think that information or advice which costs nothing is worth just its price, that is nothing, and to disregard it accordingly, as I have had frequent occasion to observe.

Note.—In considering the effects of lime, I overlooked the circumstance that sodium carbonate and potassium cyanide in solution together will, wholly or partially, exchange constituents which, however, will not alter the ultimate effects.

It seems prohahle that there may he a formation of ammonium cyanide in the solution. Atmospheric oxygen ahsorbed hy the solution, produces, I think, not a cyanate as suggested by Mr. MacArthur, but potassium carbonate and ammonium carbonate; the latter prohably transfers carhon-dioxide to the alkali of the cyanide and forms ammonium cyanide.

So long as an ammonium salt is present, the electrochemical action in the precipitating box must produce, not caustic alkali, but caustic ammonia, a part of which must escape, entrained by the hydrogen, while another part takes up atmospheric CO , prohahly traosferring that to the alkali of a portion of the alkali cyanide, and returning to the state of ammonium cyanide; thus the latter salt may gradually accumulate in the stock solution.

I have made some experiments on a sample of auriferous pyrites which yield nearly all of the gold to seven hours treatment with a one per cent solution of potassium cyanide. My resul's indicate that the cyanides of potassium, sodium, and ammonium are equally efficient, molecule for molecule, and that, with such an ore at least, the presence of an alkali chloride has no marked influence.

C. H. AARON.

TIME A FACTOR OF SUCCESS.

SONORA, TUOLUMNE CO., June 20, 1892.

TO THE EDITOR:—In an article written hy myself regarding the cyanide gold prncess, and which appeared in your issue of the 11th June, I omitted to state a fact which I consider impoitant to those investigating the matter, and in view of the discussion now heing had regarding this process. *Facts* alone enahle us to reach logical cnnclusions. They are the premises in the inductive system of philosophy.

There is in this county a mine (the Pine Nut) whose ores are very hase and refractory—consisting of quartz and the sulphides of iron, copper, lead and zinc. The ore is heavily sulphureted, the zinc in nnusually large propnrtion. It contains gold and silver in good paying quantity.

I made two tests of this ore from the same sample, having selected it as the basest ore I could ohtain in tbe county. Now for the fact and results.

The first trial was made during *five* hours of contact of the ore with the solution, and the solution was passed through *zinc shavings*. Result, 82½ per cent gold and 61¾ per cent silver.

The second test on a portion of same sample, the contact of ore with solution heing *seven and one-half* hours, the solution was kept in motion in contact with several zinc plates, presenting large surfaces to the solution. Result, 92¼ per cent gold and 79½ per cent silver.

A short increase in time, with the zinc plates, gave a marked increase in yield. This is the fact I wish parties testing this process to note. My results show *time* to he an important factor of success. Yours truly,

LOUIS BLANDING.

STRENGTH OF THE SOLUTION.

GRANGEVILLE, IDAHO, June 25.

TO THE EDITOR:—In Mr. J. S. MacArthur's article, recently published in the PRESS, "The Cyanide System," it seems to me that he omited a very essential, in fact an ahsolutely necessary part of the process to he understood, and that is, the strength of his "cyanide solution" for practical and economical working. Toward tbe close of his article he says: "By the cyanide method one ton will treat 100 tons." I am very douhtful on that proposition, that a one per cent solution of cyanide of potassium will attack sulphide ores with any such activity as he claims. Further, how does he procure "threads of zinc," one pound of which occupies two gallons measure." I hope you will take these questions up in your valuahle paper. Yours very truly,

H. W. BUTLER.

THE MINING BUREAU'S INVESTIGATIONS.

SAN FRANCISCO, June 25, 1892.

TO THE EDITOR:—In your issue of May 21st "A Practical Miner" says in regard to the new cyanide process: "By the way, how is it the State Mining Bureau has not told us ahout this new process? If there's anytbing in the thing, as Paul and the rest of them pretend, I think the Bureau would know and would let us know all about it. That's what we keep it for, I guess."

In your issue of June 4th, Almarin B. Paul, in an answer to "A Practical Miner," says: "Ahout the only sensible feature I see in your correspondent's article is his query as to the Mining Bureau. The Mining Bureau is like too many scientific men; they want to wait until the process gets popular and everyhody is posted, then tbey will talk wisely."

Please do the Mining Bureau the justice to call attention to the fact that the "cyanide process" was investigated hy it in 1889, and that an article treating of the process was puhlished in the report for 1890 long hefore Almarin B. Paul had even heard of the process. In fact, if his own statements are worth anything, it was the Mining Bureau's report that induced him to take the trip to Denver to investigate the "cyanide process." Truly yours,

WM. D. JOHNSTON,
Chemist State Mining Bureau.

In the article referred to by Mr. Johnson in the above letter, he quotes a description of the MacArthur-Forrest process, written by Mr. Wm. Jonea, December 21, 1889, and then publiahes the following conclusiona in the report of the State Mining Bureau for 1890:

The claims set forth in the above article undoubtedly caused great surprise to the chemists as well as to the mining engineers of the civilized world. That cyanide of potassaium would dissolve metallic gold and silver, forming aoluble double cyanides of gold and silver, had long been known to chemiats and electroplaters, and the double cyanide of gold and potassium ianow the favorite aolution of gold used in gold-plating. That a dilute solution of cyanide of potassium would extract gold and silver from their combination in sulphureta of iron, etc., leaving the sulphurets apparently unchanged by this treatment, was certainly an amazing atatement, and justified to a great extent the incredulity with which chemists received the article, and the refusal of many of them to test the truth of the statement for their own satisfaction.

Tbe writer confesses to having shared in tbe doubts of the majority, and for a time looked upon the subject as a companion of the schemes attempted to be palmed off on our capitalists by Alfred Paraf, of oleomargarine fame; Major Tichenor, of Calistoga notoriety; Rohertson (alias potassium cyanide), of San Francisco; and tbe "green gold" swindlers of San Rafael.

Tbe "Paraf" scheme consisted in the discovery of tin ore on the Potrero, adjoining the city of San Francisco on the south. In 1875 he had some of the newly-made "Bonanza Kings of the Comstock" in a high state of joyful mental excitement; one of them was carrying in his vest pocket little buttons of tin that he had seen smelted from the Potrero rock by the cunning Paraf and his mysterious process. The regular chemists of tbe city, not being able to extract tin from the "Paraf tin stone," were for a time under a cloud. Paraf was finally cornered into smelting some of his ore in a chemist's laboratory, his secret of extraction being in the use of a liquid (which he called pure glycerine) as an ingredient in the fluxing.

Tbe experiment was tried in the presence of one of the "Bonanza Kings," but Mr. Paraf was not allowed to handle the fluxes and, to his chagrin, the addition of glycerine failed to produce a tin hutton. Paraf went to a well-known drug store and brought back a bottle labeled "pure glycerine" and wanted to try it over witb his liquid; the hottle was seized and the glycerine found to be a saturated aolution of chloride of tin. This explained very satisfactorily the source of the successful results in his assays, but at the same time prevented the transfer (to use a slang phrase current in this part of the world) of any of the capitalist's "tin" to Paraf's pocket.

Major Tichenor's wonderful discovery was that the water of the springs at Calistoga contained gold, in the form of "terchloride," and was readily precipitated by the addition of protosulphate of iron.

Notwithstanding the absurdity of this claim and its ready exposure by the State Mining Bureau almost in its infantile stage, numerous people, with more money than brains, readily purchased interests from the smooth-talking Major Ticbenor.

About 1880 Robertson entered the field with a wonderful discovery, which yielded results in Robertson's hands that caused people's eyes to open with astonishment and in some cases their purses, also.

His "process" was to beat the quartz in lumps in a muffle; then drop it while hot into a solution of cyanide of potassium; crush, grind and amalgamate it, when he invariahly found gold. The fact that he was manipulating rock that did not carry any gold that a fire assay could detect did not at all interfere with his obtaining very respectably sized lumps of amalgam, which upon retorting showed the yellow gold.

But that the gold was due to Robertson, and not to any special merit of his process, was shown by the fact that a manipulation of the rock carried out by the writer under Robertson's own instructions and personal supervision (except that Robertson was not allowed to get close enough to exercise any legerdemain) failed to yield any gold.

The "green gold" scheme of San Rafael, which depleted the purses of some of our citizens, who doubtless have often since smiled at tbeir credulity, consisted in the claim that a ledge in Marin county contained paying quantities of gold, but in a "green" state—that is, it was not yet fully matured into metallic gold, whicb maturity, however, certain parties, by a secret process, could bring about in short order.

This "green" or "youthful" gold had the unfortunate property of escaping detection by the ordinary assayer, hecause, as they asserted, of a lack of knowledge to flux it properly so as to render it "maiure," and, consequently, visible. One of the secrets of their fluxing that they were willing to give to the public was that the presence of traces even of common salt in the fluxing would cause this "green gold" to volatilize. This information spread so rapidly in the early part of the last decade that it was not at all uncommon for assayers to be requested by customera not to put any aalt in their cruciblea as a part of the fluxing.

The stock in this company found many purchasers; but it is needless to remark that the only "green" gold that ever matured was that portion that waa taken from the "green" investors' pockets.

In the first experiments on the MacArthur-Forrest procesa, made in the laboratory of the State Mining Bureau, the sulphurets treated with a 1 per cent aolution of cyanide of potassium only yielded 40 per cent of the assay value. Upon investigation the sulphurets were found to contain free gold, and after treatment with the cyanide solution free gold was found by carefully panning.

Thia induced us to make experiments as to the aolvent action of dilute cyanide upon metallic gold.

In all the experiments the actual percentage of cyanide of potassium in tbe salt used was determined, the percentage varying from 45 to 71 per cent, and sufficient of the commercial cyanide waa taken to make the actual cyanide present equivalent to 1 per cent.

With thia 1 per cent solution it was found that one hour was sufficient to dissolve gold leaf, such aa is used by aign writers. Reflecting, however, that gold in nature in the rock was very aeldom found in such an attenuated state, the experimenta were repeated on gold foil such as is used by dentists, being, as nearly as I could approximate by measuring and comparing by weight, about six timea as thick aa the gold leaf firat used.

The ahortest period of time in which gold foil of this thicknesa was dissolved was 48 hours. The deduction from these experimenta was that for the aolution of free gold in particles of an appreciable aize in a dilute cyanide solution, the new process waa not a success.

Our attention waa then directed to its action upon the gold contained in aulphureta. The sulphurets used in the experiments were typical of those worked by the chlorination works at Sutter Creek, Amador county, and contained five and one-tenth ounces of gold.

Taking the sulphurets iu the same condition as regar ds fineness of division as they are used in the chlorination process and digesting with 1 per cent cyanide, partly by percolation and partly by agitation, tbe following results were obtained:

After two hours' treatment tailings contained 35.29 per cent of the gold.
After three hours' treatment tailings contained 31.37 per cent of the gold.
After four hours' treatment tailings contained 30.37 per cent of the gold.
After six hours' treatment tailings contained 25.49 per cent of the gold.
After eight hours' treatment tailings contained 21.56 per cent of the gold.

The same sulphurets ground and passed through a "100" sieve after six hours' digestion, had left in the tailings 17.64 per cent of tbe gold.

To determine whether the dilute cyanide was capable of extracting all the gold present in these sulphurets, the following experiment was made: The ore was ground to an impalpahle powder in an agate mortar and digested for 48 hours with three different solutions of 1 per cent cyanide; the tailings were found to retain 9.80 per cent of the gold.

Another lot of sulphurets from wbicb the "free" gold had heen removed with extreme care were subjected to the following experiments: The ore was passed through a "120" sieve and digested witb a 1 per cent solution of cyanide of potassium.

After two hours' treatment tailings retained 31.2 per cent of gold.
After three hours' treatment tailings retained 28.5 per cent of gold.
After four hours' treatment tailings retained 15.6 per cent of gold.
After five hours' treatment tailings retained 15.5 per cent of gold.
After eight hours' treatment tailings retained 10.4 per cent of gold.

The "float slimes" from a $500 gold ore (tbe "slimes" assaying 5.3 ounces gold) treated for six hours with a 1 per cent solution of cyanide, yielded the best results of any of the experiments, the tailings retaining only 4.71 per cent of the gold.

In regard to the precipitation of the gold from its solution in cyanide of potassium by the aid of metallic zinc, experiments on the small scale in the laboratory appear to substantiate the claims made for this part of the MacArthur-Forrest process.

Tbe "MacArthur-Forrest" process must be regarded as a valuable addition to the metallurgy of gold and silver. Being yet in its infancy, and opening up as it does a new line of investigation and research, improvements may rationally be expected.

As noted above, the most marked success is attained when the ore is in an impalpable powder, and the precious metals in combination with the sulphurets.

From our experiments we feel convinced that in our next report we will be able to chronicle some very marked and valuable discoveries in this direction.

MR. MAC ARTHUR'S DESCRIPTION OF HIS SYSTEM OF GOLD EXTRACTION.

In order to understand the present systems of gold extraction, to properly appreciate the work already done, and to guage the difficulties to he surmounted, it is necessary for us to look back and trace the connection hetween the known forms of gold as found in nature and the methods used to separate it frcm its hase environments.

In the earliest ages gold would naturally only he found in nuggets and grains (our word caret is derived from a Persian word meaning a grain), which required no means of separation heyond picking up—happy age when gold had only to be picked up!

From grains the ancient would come down to gold dust, and this was no doubt separated from the sand or earthy matter with which it was associated, hy the skillful use of air currents which were caused to hlow away the sand, leaving the precious metallic dust. This method is still practiced in Arahia and the East. Wherever water was plentiful it was found that it did the required separation hetter and more economically than air, a method of separation which has heen and is still in use everywhere all over the world. The prospector, digger, explorer, and even the tourist nowadays provides himself with a "pan" in which to wash a sample of "dirt" at the nearest stream. From the pan comes the "cradle," "long tom," and the innumerahle mechanical arrangements for the separation of gold from earthy matters. Up to this point we have only mechanical means of separatlon which depend on the high specific gravity of gold compared with sand, clay, etc., hut at thls stage in the evolution of gold extraction we find the first move made toward a chemical method. When there was a lot of rich dirt in his pan the digger found it very difficult to wash away the last of the sand without losing a large proportion of the finely divided gold, so he hit on the expedient of pouring in a little mercury, which formed a heavy, massive, though fluid alloy with the gold, making the separation of the last portions of the light granular sand a very easy matter. This plan is still in world-wide use alike hy the solitary digger who lives in a lonely canyon, and hy the well-organized company that "hydraulics" 1000 tons of "pay dirt" per day. Let us now look at the

PRESENT STATE OF THE GOLD INDUSTRY.

Let us imagine a digger who has exhausted all the gravel and pay dirt in the canyon or gully; he travels up the gully looking to the right hand and to the left for traces of the precious metal; occasionally he finds a piece of gold-bearing rock and is led on and on till he finds the source of these auriferous stones to be a reef. Now hegins gold mining proper. A shaft is sunk on the reef or a tunnel driven into it and great masses of rock are brought to the surface, and naturally the miner is led to imitate nature hy crushing this rock to a fine sand and then he modifies the treatment, formerly given to alluvial deposits, to adapt it to the new circumstances. The ore, immediately on heing crushed to powder (which is generally done hy huge gravitation stamps), is carried over an amalgamated copper plate hy a stream of water. In passing over the amalgamated plate the gold is caught hy the mercury, while the sand, now

called tailings, is washed off. The gold is recovered by scraping the amalgam off the copper plate at stated intervals, generally once a month, when by distillation the mercury is recovered as well as the gold separated. If all the gold the ore contained existed in the heavy metallic form, the recovery by this method would be complete and the loss *nil;* but the tailings are frequently found to contain a little gold, and on close examination particles of pyrites and sulphides of the various base metals are found diffused through the mass. When these metalliferous particles are separated from the mass of tailings, it is found that they principally contain the gold, so that it is now usual in practice to pass the tailings through some form of concentrating machinery, of which the well-known Frue vanner is a good example, whereby the pyrites and other sulphides are retained in virtue of their higher specific gravity and the sand washed away. The rich proportion now called "concentrates" may contain up to 20 ounces of gold per ton, though four or five ounces is much nearer the average figure.

IF THE CONCENTRATES ARE EXAMINED

Closely, even microscopically, no free gold can be distinguished, and if they be treated with mercury, they will yield to it little or none of their gold contents. Sometimes a considerable portion of gold may be got from them by a long-continued grinding in cast iron pans in presence of mercury. This grinding seems to force the sulphur and base metals, as well as the gold, into combination with the mercury, so that the bullion got from the amalgam often contains over 95 per cent of copper, lead and other base metals, while there is a corresponding loss of mercury which is carried away partly as sulphide and partly in a "floured state." The flouring is caused by the small globules of mercury being coated with a film of sulphide of mercury, which prevents the particles coalescing. Thus there is a double loss—chemical, by the formation of sulphide of mercury, and mechanical, by flouring. This loss is so well known that concentrates are only treated by this form of amalgamation in localities where nature forbids any more elaborate process. Sometimes the amount of loss may be lessened by roasting the concentrates before amalgamation, but this is by no means a perfect remedy, as the roasting removes only volatile constituents of the concentrates, principally sulphur, while the base metals—lead, zinc, etc., are left in the form of oxide to oxidize and waste their equivalent of mercury. Attempts have also been made to decrease the loss of mercury and increase the yield of gold by adding to the contents of the pan all sorts of chemicals to "doctor" the "sickened"—that is, floured mercury. These chemicals are generally mixtures of sulphate of iron, sulphate of copper, salt, lime, soda, etc. This kind of "doctoring" may be effective in some cases, but it is seldom practiced with intelligence. Where the percentage of concentrates is limited, and where there are a number of mines, it is common for some enterprising man to set up a smelting or chlorination work which is made large enough to deal with the concentrates of the district. I will not take time to describe the various processes of smelting, nor could it be done at any evening sederunt; but we may bear in mind that all smelting processes end in alloying the gold with lead, and cupelling in the usual way, with which we are all familiar. Because of the obvious impracticability of smelting, requiring well-built brick furnaces, coal, fluxes, etc., at the typical gold mine high up on the mountain range, possibly near or beyond the timber line, chlorination is much more commonly practiced and consequently merits a full description. In giving this description, I will confine myself chiefly to the old standard Plattner process as I have seen it practiced in California, where timber is abundant and cheap.

THE FIRST AND ESSENTIAL OPERATION

Prior to chlorination proper is roasting. It is obvious that a mixture of sulphides and arsenides of iron, copper, lead, zinc and metals generally will absorb an almost unlimited amount of chlorine, so that the small proportion of gold present would fare badly in a general scramble of the molecules for chlorine. That the metals may have the least opportunity to combine with chlorine, the sulphur is expelled, and their affinities satisfied as far as possible with oxygen by roasting. The roasting is generally done in a large reverberatory furnace, that has no very noteworthy feature in its construction. The concentrates are charged into the furnace at the cold end, heated very gradually, continually stirred and slowly worked forward into the hottest part, care being taken to admit air freely during the whole operation. Where chlorination is practiced on the most extensive scale, this roasting generally takes about 24 hours, and consumes from a minimum of half a cord to a cord of wood per ton, roasted. (A cord of wood gives about as much heat as a ton of coal.) It is a common saying that the success of chlorination depends more on the furnaceman than on the chlorinator, and on looking into hard chemical facts, we find that this is really the case, for if only one-half per cent of iron were left unoxidized it would absorb nearly one per cent of chlorine, equal to about three per cent of bleaching powder, and all this before the gold gets a single molecule of chlorine. Toward the end of the roasting, and about 15 or 30 minutes before the ore is discharged from the furnace, it is usual to stir in a small proportion of common salt. The object of this is to satisfy with chlorine, as far as possible, copper, zinc and other metals whose oxides have a tendency to form chlorides when they get chloride presented to them in the free state. This chloridizing device is, however, only partially effective, as the chlorides formed are apt to be immediately decomposed under the influence of hot air, and in the case of lead, the oxide of sulphate will not combine with chlorine in the furnace, but combines with it readily when offered moist and at the ordinary atmosphere temperature.

THE ROASTED AND OXIDIZED ORE

Is now sprinkled with water to make it slightly moist and is then charged into a wooden vat having a perforated false bottom. The chlorine, generated at an outside source, is led in between the true and false bottom, and gradually permeates upward through the mass of the porous ore. The small amount of water held by the ore then becomes a saturated solution of chlorine, which gradually acts on the gold, so that in the course of one or two days it may be washed out as the soluble chloride by a further amount of water. This weak solution of chloride of gold is run into a tank, a solution of ferrous sulphate added, precipitate of gold allowed to settle for 48 hours, if possible, and the supernatent solution allowed to flow off. When sufficient gold precipitate has accumulated, it is collected and run into bars. Besides the Plattner form of chlorination which I have described, there are others which vary from Plattner and among themselves in the manner of application of the chlorine—most of them using revolving barrels instead of open vats for the chlorination proper. The best known of these are:

The Mear's process, where chlorine is used under its own gaseous pressure.

The Newbery-Vautin, where air pressure is used:

The Pollok, recently described before this section of the society, where hydraulic pressure is used, and the Thies, where the chlorination is done in a barrel without any pressure, as described in this journal, 1889, 895.

Let us now return to the mine. The deeper we sink down into the reef, we find that while the richness of the ore may remain constant, the proportion of free gold, that is, amalgamable gold, becomes smaller and smaller, while the proportion of gold-bearing sulphides becomes greater and greater till we come to the water level, where it often happens that the free gold leaves entirely and becomes wholly refractory — that is, nonamalagable. The water level is generally regarded as the point where the atmospheric and weather influences cease, and that down to that point the rain water has penetrated and gradually washed away the oxidizable base metals, leaving the inert gold in the crevices of the equally inert quartz, whereas, the ore found below the water level, not having been subjected to oxidizing influences, retains all its metals untouched and unchanged.

AN INTERESTING PROBLEM

Now presents itself: An ore consisting of a complex mixture of silica and the various compounds of iron, copper, lead, zinc, antimony, arsenic and sulphur (for convenience I will include all these compounds under the general term sulphides) and gold in the proportion of 10,000 parts of silica and sulphides to one part of gold, is very much richer than the average auriferous ore, and the question is, how can we best separate the one from the ten thousand? Under favorable circumstances, the gold and the useful metals may be recovered by smelting, but these favorable circumstances, which are proximity of the gold mine to coal, clay, limestone and other fluxes, are quite exceptional, as auriferous reefs are generally found in primary formations. As before implied, chlorination is frequently inapplicable—no attempt is ever made to chlorinate gold ore containing an appreciable quantity of lead—and where applicable is always troublesome and never cheap. When this question presented itself to Dr. Forrest and myself, we tried to find some solvent which, unlike chlorine and mercury, would have a stronger affinity for gold than for sulphides. Acting on this principle, we drew out a list of all probable or possible solvents fulfilling this condition. This list included cyanides, and we found that these salts solved the problem.

THE EXPERIMENTS.

Our experiments were conducted first on a small scale, and on ores of all kinds and from all mines in all parts of the world. The result of these small trials was so satisfactory that we gradually worked from less to more, and in no long time larger quantities were worked, and now the process is in or on the eve of being put in operation in all quarters of the globe. I have now much pleasure in describing the method of working most generally applicable. The ore is ground to about the fineness of sea sand. If, instead of ore, we are working tailings from the amalgamation process, these are generally not to reground, but treated as delivered. The finely divided material is mixed with a solution of a cyanide say cyanide of potassium, containing on an average 0.4 per cent of cyanogen as the cyanide of potassium or other alkali or alkaline earth. The ore and solution are stirred together for about six hours, more or less, this being the average time required to dissolve the gold; in practice the time required is determined by direct experiment. When the gold is known to be dissolved, the pulp is discharged into an ordinary filtering tank, where the filtration may if necessary, be assisted by suction, and where the ore is washed by water or by the waste cyanide solution from a previous operation. The ore, after treatment with cyanide solution, is unchanged to the eye, as almost nothing but the imperceptible proportion of gold present has been removed. The gold now being in solution, the next object is to get it precipitated, and here we encounter a serious difficulty. Gold and cyanogen have such a strong mutual affinity, that it is difficult to get any substance that will separate them. The gold cannot be precipitated by an ordinary method, such as the use of ferrous sulphate or oxalic acid; even sulphureted hydrogen and sulphide of sodium will not precipitate gold from its cyanide solution, though they precipitate silver. On referring to books on electrogilding, we got no assistance, as the invariable method given for the recovery of gold from cyanide solutions was, evaporate to dryness and fuse the residue. We had noticed, however, by experiment, that zinc precipitated gold very feebly, and tried this in the same way that copper is precipitated from its ordinary solutions by scrap iron, but scrap zinc had no effect; then granulated zinc was tried; with a most imperfect and disappointing result; then heating in presence of scrap and granulated zinc, but this had only the effect of forming urea, and assisting the precipitation very little indeed. Further, we tried zinc dust, but still there was no success; finally, we prepared some zinc in a form like sawdust, porous and with a large surface of bright metal. On allowing the cyanide of gold solution to trickle through a mass of the zinc, we found that it trickled out gold free, and better still, we found that the action became more vigorous and pronounced after a portion of the gold had been precipitated on it, doubtless as gold and zinc formed together a more powerful electro-chemical precipitant than zinc by itself. An arrangement of a porous mass of zinc like a sponge formed a chemical filter, which at once precipitated and collected the precious metal; indeed, so like an ordinary water-purifying device was this zinc filter, that many nontechnical visitors formed and held tenaciously to the idea that the gold was in suspension in the cyanide solution, and the zinc was used merely because of its durability.

IMPROVEMENTS IN DETAIL

Were made in the direction of increasing the surface and decreasing the weight of the zinc, till now we have it in threads, 1 lb. of which occupies about two gallons measure. The zinc in this form is possessed of enormous chemical activity, of which the strongest and most direct evidence is the fact that it burns in the air like thin shavings of wood. When the gold has been deposited, it is necessary to separate it from the excess of zinc present. The filiform structure of the zinc, and the exceedingly fine powder, as which the gold is deposited, render this an easy matter. The filiform mass of zinc with gold powder adhering is vigorously shaken in water, when the gold falls off, and the fibrous particles of the zinc may be collected in a sieve. The gold settles easily, is collected, and fused directly into bullion.

Having now described the chief points in the process from the technical standpoint, let us look at the

PURELY CHEMICAL ASPECT

It presents. Reference has already been made to the fact that a cyanide solution acts on the gold in ores in preference to the sulphides of base metals with which it may be combined or associated; this selective action is the keystone of the whole process. It is known that metallic gold is dissolved by a cyanide; it is also known that sulphides of copper, zinc and iron artificially prepared are readily acted on by a cyanide solution; but we found a very different state of affairs in treating ores where these or similar compounds exist prepared by the hand of nature herself. Nature seems to render the base metallic compounds insoluble, while the gold combined with or contained in them is more easily acted on than the metal itself. This at once raises the question—how does gold exist in base refractory ores; is it combined or free? This question, I admit, I cannot answer satisfactory to myself. Judging from theoretical considerations only, I think gold should exist almost invariably in the free state, for if we assume that sulphides, pyrites, etc., were formed by deposition from aqueous solution, the gold would be deposited in the metallic state. This may be shown by dropping some powdered pyrites into a solution of chloride of gold, when gold will be precipitated as metal; on the other hand, let us assume that the pyritous formations carrying gold were formed by igneous agency, in this case the gold ought to be metallic, too, because any sulphide of gold already existing would be decomposed by the high temperature, and of course sulphide of gold cannot be formed at a high temperature. It is true that sulphide of gold may combine with any alkaline sulphide and resist decomposition by heat, but such a combination as a matter of fact does not occur in nature. Telluride of gold, and I think antimonide of gold are not decomposed by heat, but they occur in small quantities only, and do not affect the general argument. In spite of these theoretical considerations, however, we have strong evidence to show that gold exists in several different states of combination or molecular structure. Let me give

ONE CASE IN ILLUSTRATION.

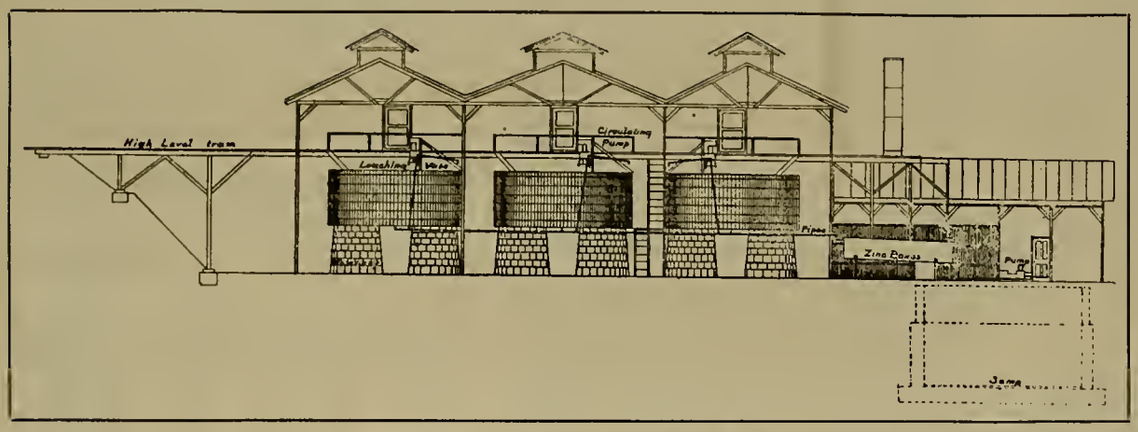
A sample of tailings from the ordinary process of stamping and amalgamation was received, and I think it may safely be assumed that the mercury had extracted some gold from the ore which produced these tailings. We treated the finely ground tailings by alkaline solution of bromine which extracted a considerable portion of gold, and the bromine treament was repeated time after time till it ceased to extract gold; then it was treated with a hot solution of ferric bromide which yielded a further quantity of gold. This treatment was repeated time after time till it ceased to extract gold, and finally the residue of tailings were smelted and a still further quantity of gold produced. As this ore yielded its gold in stages to the four different processes of amalgamatioo, treatment with bromine, treatment with ferric bromide and smelting, we infer that the gold existed in four different states, mechanical or chemical. Notwithstanding the complex nature of these tailings which consisted of all sorts of sulphides with the fourfold gold, the cyanide acted on it, almost perfectly extracting 93 per cent of the precious metal, whilst the higher extraction by any of the bromination methods was about 40 to 50 per cent. The cyanogen seemed to have an affinity for gold and a power of penetration so much stronger than mercury of bromine, that it broke through barriers impregnable to them and captured the gold. Elsner has stated that metallic

GOLD DISSOLVES IN CYANIDE

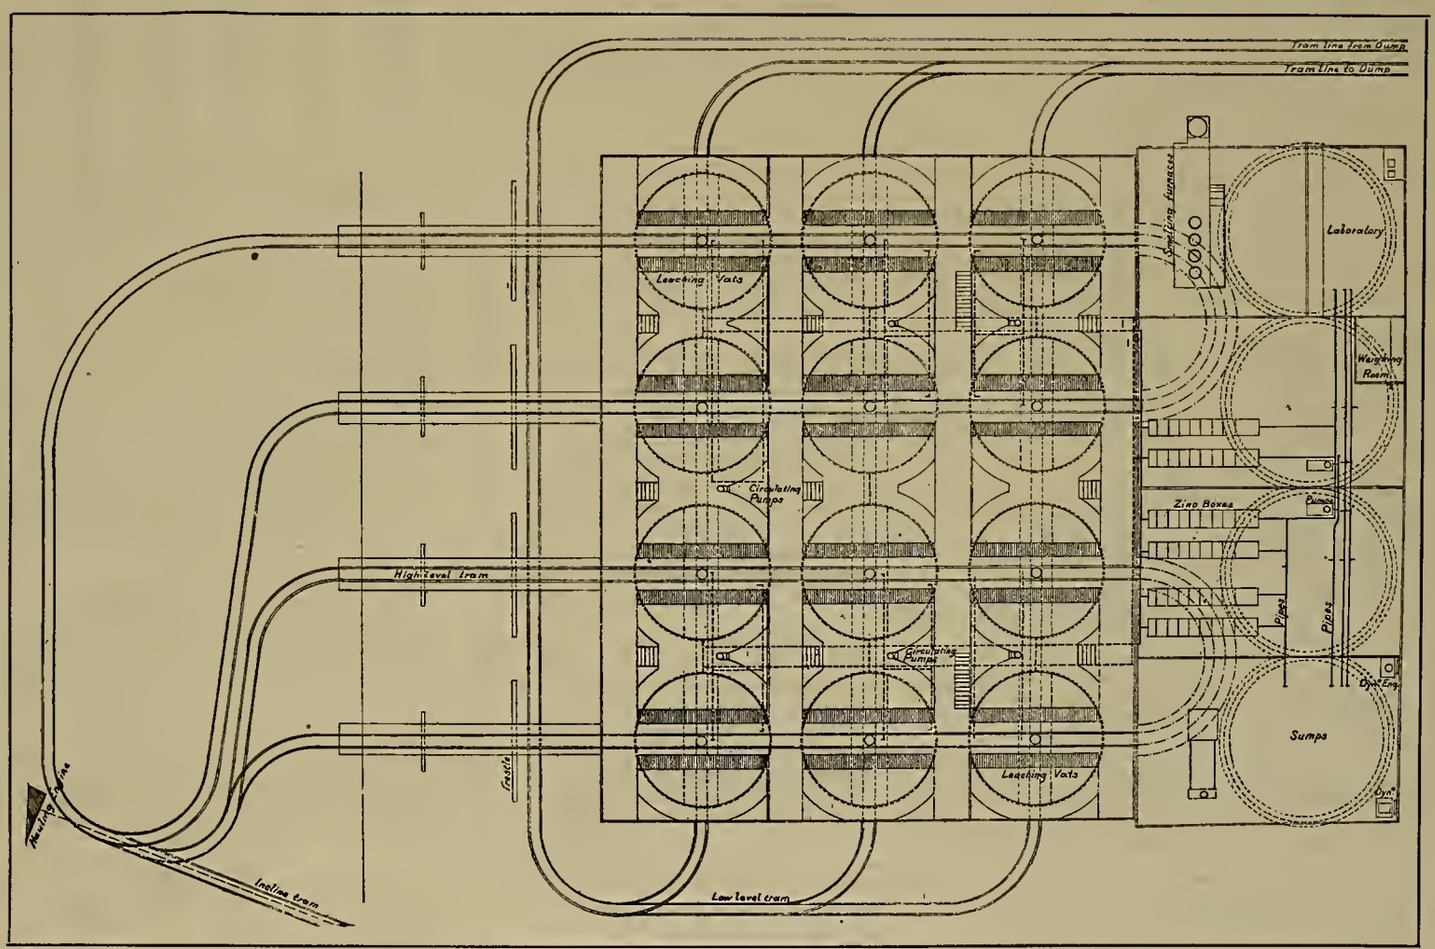
Of potassium only in presence of oxygen. Not having seen the original account of Elsner's researches, I am not in the position to criticise his experiments, but I never could find that the presence of oxygen was necessary either to dissolve gold by itself or from ores by cyanide. If a piece of gold be immersed in a cyanide solution so that air to act on it would have to penetrate two inches or three inches of the solution, the gold will dissolve in its usual slow and steady fashion. The equation shows that either oxygen must be absorbed or hydrogen evolved. I have seen no evidence of the former, and can adduce no proof for the latter, but I think the latter more probable, because I cannot conceive oxygen penetrating even a film of cyanide solution without at once oxidizing the cyanide to cyanate, whereas in the other case, as suggested to me by my friend Mr. Ellis, the nascent hydrogen may be at once seized by the excess of cyanide present and ammoniacal compounds formed. However, we do not concern ourselves much with the reactions of pure gold, but as a matter of

fact we cannot find that oxygen plays any part in the cyanide extraction of gold from ores. We have treated an ore with cyanide with free access of air, and then a parallel experiment was done with boiled water, the bottle filled to the stopper with solution and ore, and the stopper sealed. The extraction was the same in both cases.

We have so far only considered ores which are refractory from chemical as well as mechanical causes, but ores are frequently found in which the gold is refractory from a purely mechanical cause, which is the extremely fine division of the gold. The cyanide process is quite as applicable to this class of ore as any other. These ores are generally spongy and absorbent, and this, we find, enables us to dispense with stirring the ore and cyanide solution together, the same end being accomplished by allowing this cyanide solution to percolate slowly through the mass—a clear saving in power.



LONGITUDINAL SECTION OF CYANIDE WORKS.



PLAN OF CYANIDE WORKS FOR TREATMENT OF GOLD ORE TAILINGS, SOUTH AFRICA.

THE ADVANTAGES CLAIMED

For the cyanide process over smelting and chlorination are: As compared with smelting, it requires no furnaces and no coal, and no fluxes, and thus may be used successfully in remote situations where smelting is utterly impossible. As compared with chlorination, cyanide process involves no roasting, therefore no furnaces and no fuel. Moreover, by the cyanide process, ores containing lead, zinc or earthy carbonates, which cannot be worked to profit by chlorination, may be easily and profitably treated as any other. For chlorination, about seven per cent of the weight of the ore to he treated often has to be carried to the ore in the form of bleaching powder, say 1½ per cent, bisulphate of soda 2 per cent, and sulphate of iron 2 1-2 per cent, with packing, say of 1 per cent, whereas about 1 per cent of the ore to be treated will cover the weight of the necessary cyanide, zinc and packing. Thus, by chlorination, one ton of chemicals will treat only about 14 tons, whereas hy the cyanide method one ton will treat 100 tons.

Moreover, chlorination does not extract any silver, but by the cyanide method the most of the silver—invariably associated with gold in ore—is extracted along with the latter metal at the same operation. For the sake of simplicity, I have not named silver in the body of this paper, hut the remarks made in reference to gold generally apply to the silver associated with it.

From what I have seen of gold mines and gold mining in the Sierra Nevada, in the Rocky Mountains, in the Southern States of America, in Nova Scotia, from the many kinds of ore I have seen from all parts of the world, and from what I know of the selective and energetic action of cyanides, I confidently predict that cyanide of potassium, hitherto used only to polish amalgamated plates, will take a front rank as chief agent in gold extraction.—*J. S. MacArthur, in Journal of the Society of Chemical Industry.*

RESULTS OF WORK ON TAILINGS.

At Witwatersrand, Transvaal, South Africa, is a gold mining camp now making a very large annual production, in fact more than the whole State of California. These are generally known as the Johannesburg mines. The product is gradually increasing, and the very best methods of reduction have been adopted. In addition to the ordinary milling process, extensive chlorination and cyanide process plants have been erected by some of the companies. The Robinson Gold Mining Company has put up a cyanide plant capable of dealing with 75,000 tons of tailings per annum. Both the chlorination and cyanide works were designed by Charles Butters, a metallurgist, formerly of Shasta County, California.

At first they had an old plant for this process, erected by the Gold Recovery Syndicate, to carry out a contract with the Robinson Company for the treatment of 10,000 tons of tailings. The contract was completed at the end of June last, and the company availed itself of the option to purchase the plant and to work tailings by this process on royalty. The works have since been fully employed to the company's advantage, the bullion produce for the year 1891 amounting to 19,260 ounces of gold.

The new cyanide works (shown in the plans) were designed, erected, and started partial work in December last, producing for that month 1043 ozs., 12 dwts. of bullion. The works are now in perfect order, and in conjunction with the old works will treat about 8000 tons per month.

The plant is of excellent construction, and designed for durability, capacity and cheap work. It consists of 12 circular open leaching vats of special improved design, each having a capacity of 2000 cubic feet, and holding 100 tons of tailings and cyanide solution. The vats, built upon elevated tunnelled stone foundations, are filled from high level tramway above them, and emptied through trap doors in their center into tram-cars in the tunnel below.

Next in order and placed below their level is a series of zinc precipitating boxes, designed to continuously precipitate gold from solution as it passes from leaching vat to sump. Underneath the zinc boxes are four 200-ton sumps, brick and cemented tanks set in the ground. In these sumps are prepared and stored the solutions for dissolving and washing out the gold.

On the top of them are placed a double set of duplex pumps arranged that both, or either, will throw from any sump into any leaching vat. On the tram-level above the vat is a 10-h. p. double drum winding engine and boiler employed to hoist out of tailing pits the tailings to be treated.

The plant includes four furnaces of large capacity for the smelting and refining of bullion, as also laboratory and weighing room. A very careful system of tram-lines is laid down, on both high and low levels, for delivery and discharge of tailings in the most direct and efficient manner. Works, pits and dumps are lit by electric light. Lathes for cutting zinc are employed, and a 12-h. p. (Archer) engine with 16-h. p. boiler, supply all power and steam required. The whole is covered by an airy building of wood and iron.

The methods of work are: Hoisting tailings and filling vats; pumping cyanide solution on to the tailings (in the vats) to dissolve their gold; running off this gold solution into zinc boxes and precipitating the gold; return of the cyanide solution into the sump below for repeated use; col-

lecting, smelting, and refining of the gold precipitated.

The gold produced from all sources by this company in 1891 was as follows: Mill, 66,850 ozs.; chlorination works, 7881 ozs.; cyanide works, 19,260 ozs; chlorination from concentrates bought, 101 ozs. Total, 94,092 ozs. 10 dwts.

The percentage of gold now recovered from all sources is as follows:

Mill	71.04	94.82%
Concentrates 95% of 5.41%	5.13	
Cyanide 73% of 25.55%	18.55	

The company employs 1110 men, of whom 257 are whites and the rest Kaffirs. The cyanide works at this mine have been quite successful, and led to the adoption of the system at other mines in the district.

SOUTH AFRICAN CORRESPONDENCE.

From a letter received by Almarin B. Paul from his South African correspondent, who is one of the leading chemists conoected with the several large companies there, workiog the MacArthur-Forrest process, and bearing date May 14, 1892, we bave been permitted to extract as follows:

"I have treated concentrates assaying 10 ounces of gold per ton, by percolation, and obtained from 94 to 98 per cent extraction. * * * *

"We are erecting at present two large mills, which bring up the number worked by ourselves to nine. There are also several working on royalty. One of the new mills which we are erecting at present will treat over 3000 tons a montb. Tbe other mill is a new venture like yours. [The Paul wet way, using solution in the battery.—ED.] We have, for this mill, fitted up 12 large circular vats, their capacity being 18 feet in diameter and five feet deep.

* * * * *

"The Laoglasgte Estate G. M. Co. have fitted up the largest cyanide works in Johannesburg. Tbey have over one-half million tons of tailings ready for treatment, besides having 180 stamps. Tbey have fitted up five large circular tanks, each tank will hold from 400 to 500 tons of tailiogs, and they intend to treat from 8000 to 10,000 tons a month. * * * * *

"The gold produced in the month of April by the MacArthur-Forrest mills was £33,202 as far as reported."

EXPERIENCE AT THE MERCUR MILL.

The pioneer mill to operate the cyanide process in Utah is owned by the Mercur Gold Mining and Milling Co. The adoption of the process was owing to a visit, by Mr. Gill S. Peyton, the treasurer of the company. He had shipped to the mill of the Gold and Silver Extraction Co. in Denver, Colo., a carload of ore from his mines in Utah. The Denver mill was turned over to his entire control and the trial was conducted under his personal management. He is an assayer and chemist of ability and superintended all the tests made. The result (an extraction of from 85 to 90 per cent) so well pleased him that he prevailed upon his company to adopt the process.

In a letter recently received by the Denver Co., he reports his experience in connection with the process, as follows:

Having used the MacArthur-Forrest process for six months, we feel that we have gotten beyond the experimental period, and as our experience may be beneficial to parties having low-grade ores, will briefly outline:

The Mercur Gold Mining and Milling Co., of Fairfield, Utah, eight months ago had just completed a pan-amalgamating mill at a cost of $30,000. Like other mills, it proved a dismal disappointment to the stockholders. Trial after trial only showed a saving of from $3 to $4 per ton from $20 ore. At just about the time we had demonstrated that amalgamation was a failure on our ore, we received circulars from you of the MacArthur-Forrest process. In just three days after receiving these circulars I was on my way to Denver to investigate and see what your process would do for our ore. Must state had very little faith in the process, and especially when told by older hands in the milling business that it was money thrown away to investigate in such an absurd thing as cyanide extracting gold, but it proved to be even more than was claimed for it.

Our first experiment was to agitate the ore in the cyanide solution. This we found impractible on our particular ore, owing to considerable clay that it contained. So much slime was made that the solution would not pass through the pulp. Then percolation was tried with encouraging results. The great surprise to us was tbe coarseness we could extract the metal from the ore. A great part of the pulp treated contained pieces as large as hazel nuts, and showing an extraction of from 85 to 90 per cent. After 16 days of experimenting in our assay office, the work was placed before the Board of Directors of the Mercur Company and approved. On tbe adoption of the MacArthur-Forrest process, a remodeling of the mill immediately followed. From 10 to 15 tons per day was the tonnage until the first of April, 1892, when the capacity was increased to 50 tons per day.

Our extraction at first showed a saving of 75 per cent and a consumption of two and one-half pounds of cyanide per ton.

The last 90 days' run up to March 1st (when the mill was closed down to increase capacity) gave an extraction of 88½ per ceut, with only one pound of cyanide per ton consumed.

A brief description of the manipulation at the Mercur Mills may be of interest here. The ore passes from the rock breaker to a set of 20-inch wall rolls, and on into a second set of smaller size, where it is crushed into proper fineness, a large proportion of the pulp being as large as a small pea (we use no screens). From here it is elevated into storage bin; from this bin the tanks are filled by car, to a depth of 33 inches. The cyanide solution is turned on, and pulp left standing in solution for 12 hours; then the solution is passed through continuously until gold is extracted, which varies from 36 to 48 hours. The solution now, containing gold, as it passes from the tanks, flows into a sump from which it is pumped into a tank above the leaching tanks. From this tank it flows through a box which contains a sufficient amount of zinc shavings to clean all the metal from the solution. From the zinc box it passes into the standarding tank. Here the solution is brought up to the standard strength, which is one-fourth of one per cent, and again starts on its tour through the leaching tanks, with an occasional feed of cyanide. This solution never grows tired, for the same solution is now in use that we started with six months ago, and still has as great affinity for gold as when it started. A great advantage is derived where water is an item by the amalgamating process. We were limited to about 25 tons per day owing to the scarcity of water. The same amount of water would permit us to work by the MacArthur-Forrest process 150 tons per day.

Comparative results by actual experience on our ore by amalgamation and the MacArthur-Forrest process are as follows:

Fifteen hundred tons of our ore treated by amalgamation gave an average extraction of 20 per cent at a cost of $4.25 per ton for milling.

Sixteen hundred tons of our ore treated the past 90 days by the MacArthur-Forrest process, average extraction of 88.5 per cent at a cost per ton of $2.25 for milling.

Our appreciation of the process is fully demonstrated by the fact that during the month of March we increased our capacity as before stated to 50 tons per day. The last 16 days I have made over 100 tests on refractory low-grade gold and silver ore from different parts of the country, and my experience so far has been that the greater number of them can be worked to a high percentage by the MacArthur-Forrest process.

CYANIDE OF POTASSIUM AS A LIXIVIATION AGENT FOR SILVER ORES AND MINERALS.

In the year 1866, while in the employ of the Ontario Silver Mining Company at Park City, Utah Ter., I made the discovery, novel to me at least, that cyanide of potassium was a potent solvent of the various minerals of silver which occur in the so-called rebellious ores that are generally treated by roasting and subsequent lixiviation. I made a series of experiments—too few indeed, to be decisive, yet sufficient to induce the belief that the investigation was worth prosecuting for its possible future metallurgical value. Long continued application in another field has interfered with a further study of the subject. The result of such experiments as were made are given herewith in the hopes that others working in the same line of investigation may find them of interest. According to Storer (Dict of Chem. Sol.), "Ag_2S is soluble in a solution of K Cy only when the latter is used in large excess; the small portion thus dissolved is reprecipitated, however, for the most part by the addition of water." Percy says: "It is stated that in an aqueous solution of cyanide of potassium (Ag_2S) is 'nearly insoluble,' but we have found it to dissolve in a very sensible degree, in a moderately strong solution of that salt, whether cold or hot, though more quickly in the latter. According to Freseniue it is insoluble.

Various experiments were made to determine this question of solubility. They were all submitted to like conditions. The substance experimented upon was weighed into a beaker, the cyanide solution of the indicated strength was added, and the beaker then placed on a sand bath heated to a general temperature and allowed to stand for twelve hours. The cyanide of potassium used was such as is usually furnished to mills, and which rarely contains above 50 per cent of K Cy. The percentage extracted refers to the amount of silver dissolved to one part of this *commercial* cyanide of potassium. The quantity of substance operated on was 500 mgs.; volume of solution, 100 cc.; and strength of solution 5 per cent.

TABLE 1.

Name of Substance.	Per Cent of Silver Extracted.	Weight Dissolved by 1 part K Cy.
Cement Silver	25.0	0.025
Ag S	30.9	0.025
Ag S b_2	64.4	0.023
Ag A S O	97.0	0.057

In the last four experiments 500 mgs. of the copper compounds were added to the silver mineral. The average weight of Ag dissolved to one part of K Cy. as shown in the last column, omitting the fourth line, is 0.025. closely approaching the figure 0 026, which is found three times in this column. In the fifth experiment the copper was attacked more than would be accounted for by the reduction of the Ag_2S to Ag.

The experiments in the following table were made to ascertain the effect of concentrated solutions upon the sulphide of silver. In each case 500 mgs. of Ag_2S (corresponding to 430 mgs. of Ag) were used. As before, the beakers stood in a sand bath for 12 hours under a temperature which did not exceed 100 F. Volume of solution, 500 cc.

TABLE 2.

Strength of solution in percentages per cent.	Mgs. of Ag dissolved.	Percentage of Ag dissolved.
1	130.0	30.2
2	140.8	32.7
3	174.6	40.1
4	211.5	49.2
5	246.3	56.1
5	291.0	57.5
7	348.0	81.0
8	355.1	82.5
9	395.3	98.6
10	423.9	92.1
15	429 1	98.6
20	429.3	99.7
25	429.3	99.8
5	215 0	50.0

The percentage extracted increased with the concentration of the solution, up to a ten-per cent solution. Beyond that point the increase is slow.

An experiment was made, also, to ascertain the effect of the presence of cupric oxide. The result gave a less percentage than when the silver sulphide was alone acted upon by K Cy solution of the same strength and volume. The addition of a copper salt to the solution does not act beneficially. Several cupro-cyanides of potassium were made according to the formulæ of Gwelin, but in no case was there any beneficial result.

Authorities within my reach are silent as to the solubility of metallic silver in a solution of cyanide of potassium. I give below some experiments made to determine this point:

TABLE 3.

Weight of cement silver. Mgs.	Strength of solution. Per cent.	Mgs. of silver dissolved.	Percentage dissolved.	Volume of solution. Cc.	Time of standing, hours.
500	0.50	123.8	24.7	500	12
500	0.50	125.5	25.2	1000	12
500	1 00	138.2	27.5	500	12
500	1.00	109.8	21.9	600	6
500	1.00	127.5	25.4	1000	12
500	2.00	179 5	35.9	1000	96
500	2.00	112.4	22.4	500	12
500	3.00	170.0	34.0	1000	96
500	3.00	100.0	20.0	500	12
500	4.00	145.5	29.0	1000	96
500	4.00	100.0	20.0	500	12
500	5.00	100.0	20.0	1000	96
500	5.00	100.0	20.0	500	12
500	7 00	92.1	18 4	500	12
500	8.00	100.0	20.0	500	12
500	9.00	97.3	19.4	500	12
500	10.00	83.5	16.7	500	12
500	15.00	75.0	15 2	500	12
500	20.00	88 0	17.5	500	12
500	25 00	88.0	17.5	500	12

It will be observed that the results obtained in the table above, reverse those obtained in Table No. 2, *i. e.*, the extraction with Ag_2S is directly proportional to the strength of the solution, and here inversely proportional. The only explanation I can suggest for this curious phenomenon is that when metallic silver is exposed to the action of K Cy, hydrogen gas is evolved from the decomposition of the water by the free potassium, according to the following reactions:

$Ag + 2\,K\,Cy = Ag\,K\,Cy_2 + K$; $H_2O + K = K\,H\,O + H$.

The hydrogen gas causes polarization. In fact, the gas can be seen covering the silver in minute bubbles. The reaction is probably more violent when the solution of K Cy is strong, and, in consequence, the polarization takes place sooner, thus causing lower extraction. The experiment of agitating the cement silver with the solution should have been tried. Exposing the silver to the solution for a greater period of time seems, within certain limits, to have a beneficial action.

The following table contains experiments on raw argentiferous ores. These ores are mainly from well-known localities. They embrace wide varieties of minerals. The results are extremely satisfactory in all but a few instances. They are compared with the results obtained by the Russell process. Five hundred cc of water was used with 25 grammes of commercial K Cy. One-half A T of ore was added, and the beaker allowed to stand on a sand bath until the temperature had risen to 100° F., then removed, filtered, and the residue assayed. This plan was followed throughout in the treatment of ore, raw or roasted.

TABLE 4.

Name of Mine and Locality,	Value of ore in ozs per ton.	Results by Russell's Process, Per cent.	Restlts by K Cy Per cent.	Difference in favor of K Cy.
Daly, Park City, Utah	74.0	17.0	81.0	64.1

Daly, Utah	33.0	45.6	81.7	27.1
" "	80.0	56.0	73.4	17.4

In the above experiments the difference in using a K Cy solution above the Russell process is greatest when the ores are base. For instance, the argentiferous mineral of the ores of the Horn Silver, Grand Central and the Silver Reef mines is mainly kerargyrite. On this ore the difference between the two solvents, when any, is small; but in the case of the Daly, Sombrerete, Yedras, Ontario

and Manhattan ores, the silver minerals are fahlerz, argentite, pyrargirite and argentiferous galenite and mispickels. In some of the ores mentioned are found all of the above minerals. The difference in the results obtained is quite noticeahle, and greatly in favor of the K Cy solution.

Chloride of silver is extremely soluhle in K Cy solutions. Hence it may be readily inferred that if the ore is roasted, and the silver is chloridized, it can he readily extracted hy this solvent. Ih the following table some experiments on chloridized ore are given, showing the results ohtained hy different solvents:

TABLE 5.

The following experiments I instituted with a view of ascertaining whether the length of time the ore stood in the solution had any effect or not. They were on unroasted Ontario ore:

TABLE 6.

Time of standing.	Assay value of ore in ozs. per ton.	Ounces extracted per ton.	Percentage.
1 hour.	80.8	68.4	72.3
2 hours.	80.8	58.4	72.3
3 hours.	80.8	69.0	73.1
4 hours.	80.8	58.4	72.3
6 hours.	80.8	60.2	74.6
6 hours.	80.8	68.8	72.8
7 hours.	80.8	61.4	76 0
8 hours.	80.8	61.2	75.8
9 hours.	80.8	58.8	72.8
10 hours.	80.8	64.0	79.3
11 hours.	80.8	60.4	74.8
24 hours.	80.8	63 2	78.3

The experiments, while not conclusive, showed a general tendency to hetter results as the time lengthened.

Action of K Cy on Gold-Bearing Ores.—Smee says the auro-cyanide of potassium "may he easily made hy simply placing a piece of pure gold in a solution of cyanide of potassium; hut this process requires some time." I have found that gold-leaf is readily soluhle in a moderately strong solution of K Cy, and fine gold precipitated from solution hy ferrous sulphate is greedily attacked. Cyanide extracts a large percentage of the gold from raw and roasted auriferous pyrites and from gold ores where the gold is present in a finely divided state. The following table is a compilation of experiments on ores containing gold as well as silver. The ores are now worked hy the pan-amalgamation process:

PRECIPITATING AGENTS.

Tbe foregoing experiments show that silver can be successfully extracted from its ores hy a K Cy solution. This would be of no metallurgical importance unless it could suhseqnently he precipitated from the aolution in a satisfactory condition. Various methods suggest themselves, but none have heen sufficiently tried. Theoretically, the hest precipitant would he the sulphide of potassium (K_2S), as its use would restore to the solution the molecule of K Cy, which is neutralized when the silver is dissolved. This K_2S, however, is unavailahle hecause of its unstability; it decomposes quickly. "Cadmium, mercury and silver are easily precipitated from the solution of their double cyanides, nickel, copper, zinc and manganese slowly and imperfectly; iron and cobalt not at all." (Watt's Dic. of Chem.) Contrary to the apparent authority in the ahove quotation, H_2S will not answer. Liver of sulphur, even if it did not contaminate the solution, would hardly he of use; for, while it precipitates the silver out of the liquor from some ores, yet with other ores, curiously enough, it fails completely.

The reaction in case K_2S should he used would be as follows:

$$2\,K\,Ag\,Cy + K_2S = Ag_2S + 4\,K\,Cy.$$

In case liver of sulphur was used, the reaction would be much more complicated.

The final and hest method ia electrolytically. Smee saya: "The reduction of silver metal from the solution (of K Cy) is easily performed, and ia economical, hy the aingle cell process." A atrip of C. P. copper placed in aolution of K Cy containing silver, is rapidly coated with the precious metal. The completeness of this reaction I have never teated. By the aid of a dynamo, the silver could he easily deposited with little cost on sheeta of copper. The principal objection to this heing the charging the solution with copper.

Objectiona which might be urged against the use of K Cy aa a lixiviation agent:

1. The poiaonous qualities of the solution.
2. Cyanide of potassium in strong aolution is easily decomposed by exposure to heat and air.
3. The excessive cost of the chemical.
4. Its great solvent powera for hase metala. As for the firat ohjection, the same plea ia urged against the use of quicksilver.

The second ohjection ia more valid. But, in a weak solution, such as would he used in the lixivation of ores, the decomposition would take place slowly, if at all, where the solution is in constant agitation. The decomposition of a solution of K Cy exposed to the atmosphere of a small room was scarcely perceptihle. The third objectionahle point arises from the small demand for K Cy. Let the demand be increased, and there is uo reason, even with the crude process of manufacture used at piesent, why it should not he produced at a reasonable cost; and with an increased demand for it, the methods of manufacture would he improved upon, and the cost lessened still further. Tbe fourth objection is a good one. Many copper, lead and iron salts would he carried into the solution if it was applied directly to roasted ores. On raw ores tbe effect would he less pronounced.

If, however, tbe solution was applied after the wash-water, and after a preliminary leaching by $Na_2S_2O_3$ the quantity of hase metals taken up by the cyanide solution would he reduced to a minimum.

From tbe foregoing it would appear that to work with a solution of cyanide of potassium on a large scale, if practicahle at all, the cyanide of potassium had hest he used in a weak solution (of ahout 0.5 per cent) following a preliminary leaching by hyposulpbite of soda, the hyposulphite then being washed out of the ore hy water and the cyanide applied. After the cyanide stands on the ore for the necessary time, it shonld he drawn off into its own precipitating vats, in which precipitation by the adopted method—electrolytic preferably—could take place. The "plant," with the exception of the extra vats, storage tank and dynamo, would he similar to every leaching plant used for the Russell or the ordinary hyposulphite processes.

In conclusion, I would say that the foregoing tahles are presented with hut few comments, as more extended observation and experimenting is necessary before deductions of anv metallurgical value can he drawn.

Many of the experiments were made with some of the most rebellious silver ores that occur in the Western mines or in Mexico. The results are flattering. That a solution of cyanide of potassium is a powerful solvent of silver in its ore is beyond question. The silver, too, can he recovered from its solution. In fact, the "process," if it may be so called, appears feasible, and it may be well to follow it up.—LOUIS JANIN, in *Engineering and Mining Journal*, Decemher 29, 1888.

The MacArthur-Forrest Patents.

418,137. PROCESS OF SEPARATING GOLD AND SILVER FROM ORE.—John S. MacArthur, Pollokshields, county of Renfrew, and Rohert W. Forrest and William Forrest, Glasgow, county of Lanark, assignors to the Cassel Gold-Extracting Company (Limited), Glasgow, Scotland. Filed April 4, 1889. Serial No. 305,998. Patented in Natal Sept. 11, 1888, No. 32: in New South Wales, Sept. 27, 1888, No. 965; and in Tasmania, Sept. 29, 1888, No. 609. Patented Dec. 24, 1889.

To all whom it may concern; Be it known that we, John Stewart MacArthur, residing at Pollokshields, in the county of Renfrew, and Robert Wardrop Forrest and William Forrest, both residing at Glasgow, in the county of Lanark, Scotland, all subjects of the Queen of Great Britain, have invented certain new and useful Improvements in the Process of Separating Gold and Silver from Ores (for which we have received Letters Patent in Natal, No. 32, dated Sept. 11, 1888; New South Wales, No. 965, dated Sept. 27, 1888; and Tasmania, No. 609, dated Sept. 29, 1888); and we do hereby declare that the following is a full, clear and exact description of the invention, which will enable others skilled in the art to which it appertains to make and use the same.

This invention relates to an improvement in the process of separating precious metals from ores described in Letters Patent of the United States, No. 403,202, granted to us May 14, 1889. In that process a cyanide is used as the separating agent, and it has been found that ores containing pyrites or sulphurets which have been exposed to the weather and become partially oxidized absorb a comparatively large quantity of the cyanide.

The ohject of this invention is to economize the process hy preventing the absorption of the cyanide.

The invention consists in separating precious metals from ores hy first neutralizing the ore by the addition of an alkali or alkaline earth, and then leaching such prepared charge with a cyanide solution.

In carrying out the first or preparatory step of this improved process, we take ore containing iron pyrites or other compound which has become partially oxidized by exposure to the weather and mix with it, when in a powdered state, a sufficient quantity of potash, lime, or other alkali or alkaline earth, to neutralize the salts of iron or other objectionable ingredients formed by the partial oxidation.

The quantity of alkali or alkaline earth to be employed will depend upon the nature of the ore, and must he determined hy first taking a test quantity of the particular ore to he treated and adding the alkali or alkaline earth thereto until the alkali ceases to he absorbed. Wben this condition is reached, the liquid will cause red litmus paper to turn blue. The proportion of the alkali or alkaline earth so absorbed will indicate the proper proportion thereof to be added to the bulk of the ore to be treated. In case lime is employed, one per cent of the alkali to 99 per cent of ore will generally he found sufficient. After this preparatory treatment, the ore (which may consist of tailings or residues from other processes or operations) is treated with the cyanide solution by heing agitated therewith or by heing ground therewith in a pan-mill or other suitable grinding-mill; or, as we find preferable in the case of some ores, the cyanide solution may be made to percolate through said ores one or more times until all or nearly all the precious metals are dissolved. For this percolation, very simple tanks, vats or vessels may be used, such vessels heing provided with permeahle false hottoms or any suitahle filtering apparatus. The cyanide solution containing the gold or silver is next made to pass through a sponge of zinc, whereby said metal is precipitated from the solution and retained in the sponge. The zinc sponge is preferably composed of fine threads or filaments of zinc. These zinc threads are formed in shavings cut by a turning-tool from a series of zinc disks held in a lathe; or the sponge may be formed by passing molten zinc, at a temperature just above the melting-point, through a fine sieve, and allowing it to fall into the water. The sponge thus formed presents a very large contact-surface for the solution, and it does not become easily choked.

The precious metals may be separated from the zinc sponge by distillation; or the zinc sponge containing the precious metal may be placed in a suitable sieve and suhjected to a screening operation, preferably under water. In this operation, the greater part of the precious metal will pass through the sieve and the greater part of the zinc sponge will remain therein.

We claim as our invention—

1. The process of separating precious metal from an ore, which consists in neutralizing the ore hy the addition of an alkali or alkaline earth, and then leaching the neutralized ore with a cyanide solution.

2. The process of separating precious metal from an ore, which consists in neutralizing the ore by the addition of an alkali or alkaline earth, then leaching the neutralized ore with a cyanide solution, and then passing the cyanide solution containing the precious metal through a sponge of zinc, substantially as set forth.

403,302. PROCESS OF OBTAINING GOLD AND SILVER FROM ORES.—John S. MacArthur, Pollokshields, County of Renfrew, and Robert W. Forrest and William Forrest, Glasgow, County of Lanark, Scotland. Filed Nov. 9, 1887. Serial No. 254,699. (No specimens.) Patented in England Oct. 19, 1887, No. 14,174; in Cape of Good Hope Jan. 7, 1888, No. 6,101; in Victoria Jan. 19, 1888, No. 5,572; in New South Wales Jan. 21, 1888, No. 453; in South Australia Jan. 23, 1888, No. 948; in Tasmania Jan. 24, 1888, No. 529; in New Zealand Feb. 1, 1888, No. 2,775; in Canada Feb. 6, 1888, No. 28,471; in France April 6, 1888, No. 189,808; in Belgium July 24, 1888, No. 82,673; in Brazil Aug. 23, 1888, No. 619; in Portugal Aug. 30, 1888, No. 1,272; in Italy Sept. 30, 1888, No. 23,852; and in Spain Oct. 2, 1888, No. 8,538. Patented May 14, 1889.

To all whom it may concern: Be it known that we, John Stewart MacArtnur, a subject of the Queen of Great Britain, residing at 15 Princes street, Pollokshields, in the county of Renfrew, Scotland, and Robert Wardrop Forrest and William Forrest, both subjects of the Queen of Great Britain, residing at 319 Crown street, Glasgow, in the county of Lanark, Scotland, have invented certain new and useful Improvements in Processes of Obtaining Gold and Silver from Ores (for which we have obtained patents in the following countries: Great Britain, No. 14,174, dated Oct. 19, 1887; Cape of Good Hope, No. 6,101, dated Jan. 7, 1888; Victoria No. 5,572, dated Jan. 19, 1888; New South Wales, No. 453, dated Jan. 21, 1888; South Australia, No. 948, dated Jan. 23, 1888; Tasmania, No. 529, dated Jan. 24, 1888; New Zealand, No. 2,775, dated Feb. 1, 1888; Canada, No. 28,471, dated Feb. 5, 1888; France, No. 189,808, dated April 6, 1888; Belgium, No. 82,763, dated July 24, 1888; Brazil, No. 619, dated August 23, 1888; Portugal, No. 1,272, dated Aug. 30, 1888; Italy, No. 23,852, dated Sept. 30, 1888; and Spain, No. 8,538, dated Oct. 2, 1888), and we do hereby declare that the following is a full, clear and exact description of the invention, which will enable others skilled in the art to which it appertains to make and use the same:

This invention has principally for its object the ohtaining of gold from ores; but it is also applicable for ohtaining silver from ores containing it, whether with or without gold, and it comprises an improved process, which, while applicahle to auriferous and argentiferous ores generally, is advantageously and economically effective with refractory ores, or ores from which gold and silver have not been satisfactorily or profitahly obtainable by the amalgamating or other processes hitherto employed, such as ores containing sulphides, arsenides, tellurides and compounds of base metals generally, and ores from which the gold has not heen easily or completely separable on account of its existing in the ores in a state of extremely fine division.

The invention consists in subjecting the auriferous or argentiferous ores to the action of a solution containing a small quantity of cyanide, as hereinafter set forth, without any other chemically active agent, such quantity of cyanide being reckoned according to its cyanogen, and the cyanogen being proportioned to the quantity of gold or silver, or gold and silver, estimated by assay or otherwise to be in the ores under treatment. By treating the ores with the dilute and simple solution of a cyanide, the gold or silver is, or the gold and silver are, obtained in solution, while any hase metals in the ores are left undissolved, except to a practically inappreciable extent; whereas when a cyanide is used in combination with an electric current or in conjunction with another chemically active agent—such as carbonate of ammonium, or chloride of sodium, or phosphoric acid—or when the solution contains too much cyanide, not only is there a greater expenditure of chemicals in the first instance, but the hase metals are dissolved to a large extent along with the gold or silver, and for their subsequent separation involve extra expense, which is saved hy our process.

In practically carrying out our invention, we take the ore in a powdered state and mix with it the solution of cyanide in a vessel made of or lined with any material not appreciahly acted on by the solution. We employ a vessel made

of or lined with wood; but it may be made of or lined with any ordinary inert material, such as stone, brick, slate, rubber, gutta percha, cement, glass, earthenware, iron (plain, tinned or enameled) or lead. The process is expedited by stirring or triturating the mixture of ore and solution intermittently or continuously, for which purpose any convenient mechanical agitator may be fitted to the vessel. A pan-mill with edge runners or other known triturating device may be advantageously used. The solution is allowed to act on the ore until the gold or silver is all, or nearly all, dissolved, and the solution is then drawn off from the ore or undissolved residue.

Any cyanide soluble in water may be used, such as ammonium, barium, calcium, potassium or sodium cyanide, or a mixture of any two or more of them. We regulate the quantity of cyanide so that its cyanogen will be in proportion to the quantity of gold or silver in the charge of ore; but in all cases we dissolve it in sufficient water to keep the solution extremely dilute, because it is when the solution is dilute that it has a selective action such as to dissolve the gold or silver in preference to the baser metals.

In dealing with ores containing, per ton, 20 ounces or less of gold or silver, or gold and silver, we find it most advantageous to use a quantity of cyanide the cyanogen of which is equal in weight to from one to four parts for every thousand parts of the ore, and we dissolve the cyanide in a quantity of water of about half the weight of the ore. In the case of richer ores, while increasing the quantity of cyanide to suit the greater quantity of gold or silver, we also increase the quantity of water so as to keep the solution dilute. In other words, the cyanide solution should contain from two to eight parts, by weight, of cyanogen to one thousand parts of water, and the quantity of the solution used should be determined by the richness of the ore. After the solution has been decanted or separated from the undissolved residues, the gold and silver may be obtained from it in any convenient way, such as evaporating the solution to dryness and fusing the resulting saline residue, or by treating the solution with sodium amalgam.

Having fully described our invention, what we desire to claim and secure by letters patent is:

The process of separating precious metal from ore containing base metal, which process consists in subjecting the powdered ore to the action of a cyanide solution containing cyanogen in the proportion not exceeding eight parts of cyanogen to one thousand parts of water.

JOHN STEWART MACARTHUR,
ROBERT W. FORREST.
W. FORREST.

Another Patent of MacArthur's.

411,047. PROCESS OF EXTRACTING PRECIOUS METALS FROM THEIR ORES.—John S. MacArthur, Pollokshields, County of Renfrew, Scotland. Filed December 13, 1887. Serial No. 257,801. Patented September 17, 1889.

To all whom it may concern: Be it known that I, John Stewart MacArthur, a subject of the Queen of Great Britain and Ireland, and a resident of Pollokshields, in the county of Renfrew, Scotland, have invented certain Improvements in the Process of Extracting Precious Metals from their Ores, of which the following is a specification.

My invention consists of an improved process of treating ores to extract precious metal therefrom, more particularly gold from gold-bearing ores, without the use of mercury and without roasting, so that a saving of fuel and furnaces is effected.

The chief feature of my invention consists in the use of perbromide of iron for the extraction of precious metals from their ores.

In carrying out my invention—for the extraction of gold, for instance, from gold-bearing ores—it is first necessary to have the ore free, or nearly free from silver, copper, lead and zinc. If the ore is naturally free, or nearly free from these metals, I proceed at once with the treatment of the ore to extract the gold. For this purpose the ore must first be in a powdered condition, and then I add a solution of perbromide of iron to the powdered ore without any preparatory chemical treatment. The solution of perbromide of iron dissolves the gold from the ore. This action may be much facilitated by the appliance of heat to the solution. A temperature which will give good results, is that at which the solution boils, and the solution may be under pressure in a closed vessel, if necessary. When the ore contains silver, copper, lead, or zinc in appreciable quantity, I first treat the ore with a solution of a ferric salt (such as perchloride or persulphate) to remove these metals, as has been heretofore done. The ore thus freed from these substances is then treated with perbromide of iron, as already described. The gold may be recovered from the solution of perbromide of iron by filtration through charcoal or coke. The solution of bromide may be used several times over; but by repeated use it gradually becomes converted into protobromide of iron. This may be reconverted into perbromide by the addition of bromine or other well-known means.

By the use of perbromide of iron for the treatment of gold-bearing ores in the manner described, the gold may be extracted without the use of mercury and without roasting, thus effecting a saving of fuel and of furnaces.

I do not desire to claim exclusively, or to restrict myself in all cases to the use of ferric salts for the separation of silver, copper, lead or zinc from ores containing those metals; nor do I desire to claim or restrict myself to the use of any special means for the reconversion of iron into perbromide of iron, but I claim as my invention:

1. The mode herein described of extracting gold from its ores, which consists in dissolving the gold out of the ore by treating the latter to the action of perbromide of iron, as substantially set forth.

2. The mode herein set forth of extracting gold from its ores by first removing the silver, copper, lead and zinc, by means of ferric salts, and then subjecting the ore thus freed from those metals to the action of perbromide of iron, all substantially as described. JOHN S. MACARTHUR.

Witnesses: Edmund Hunt, David Ferguson.

MacArthur's Process of Leaching Ores.

413,808.—PROCESS OF LEACHING ORES—John S. MacArthur, Pollokshields, County of Renfrew, Scotland. Filed Sept. 4, 1888. Serial No. 284,582. Patented Oct. 29, 1889.

To all whom it may concern:—Be it known that I, John Stewart MacArthur, a subject of the Queen of Great Britain, and Ireland, and a resident at Pollokshields, in the county of Renfrew, Scotland, have invented an Improvement in Processes of Leaching Ores, of which the following is a specification:

My invention relates to known processes for treating ores with acids—such as hydrochloric acid—or with solutions of salts having weak bases, such as solutions containing iron, manganese or copper.

My invention is intended for the treatment of any ores containing any one or more of the metals copper, lead, zinc, silver or gold; and my invention is more particularly applicable when the ores contain oxides or carbonates of earth metals, the presence of which causes inconvenience and waste of the agents employed in the processes as hitherto practiced.

By my invention I altogether avoid or very much diminish the inconvenience and waste referred to and the consequent expense by treating the ore with a solution of salt which will give up its acid or a part of its acid to the oxide or carbonate. The salt to be used may be a ferrous salt or the bisulphate of an alkali. Protosulphate of iron and protochloride of iron are salts having a weak base, which are inexpensive and may be used with advantage, while bisulphate of soda and bisulphate of potash are salts of stronger bases, which may be satisfactorily used when convenient.

In practically applying my invention, the quantity of the salt to be used in each case will depend on and should be at least chemically equivalent to the quantity of oxides or carbonates of the earth metals present in the ore, as ascertained or estimated in any convenient way. As an example, if a carbonate of lime is present, but no other alkaline earth in a particular ore, to the extent of, say, ten pounds for every thousand of the ore, then if a solution of a bisulphate of soda be used it should contain about twelve pounds of the solid salt. For another example, if the ten pounds of earth were carbonate of magnesia, then about fourteen and one-fourth pounds of the solid bisulpbate would be required.

The salt used will form with the oxides or carbonates of the earth metals either soluble compounds, which may be separated by lixiviation or washing, or insoluble compounds which are inert. If soda or potash is the base of the salt used, it can also be separated by lixiviation or washing. If a salt of iron is used, ferrous oxide or carbonate will be formed and will be precipitated in an insoluble condition, and, if found necessary or convenient, it may be separated by elutriation.

If carbonate of magnesia be present and the ore be treated with bisulphate of an alkali, a soluble compound of a sulphate of magnesia will be formed, and this may be separated by lixiviation.

I claim as my invention—

The process herein described of treating ores containing oxides or carbonates of earth metals, said process consisting in first subjecting such ores to the action of a proportionate quantity of a solution of ferrous salt or a bisulphate of an alkali to combine with the oxides or carbonates of earth metals, and then treating the ores with an acid or salt to obtain the contained metals, all substantially as described. JOHN S. MACARTHUR.

Witnesses: Edmund Hunt, David Ferguson.

The Simpson Patent Process.

PROCESS OF EXTRACTING GOLD, SILVER AND COPPER FROM THEIR ORES.—Jerome W. Simpson, Newark, N. J. Filed Oct. 20, 1884. Dated July 28,1885. No. 323,222.

To all whom it may concern: Be it known that I, Jerome W. Simpson, a citizen of the United States, residing at Newark, in the county of Essex and State of New Jersey, have invented certain new and useful improvements in Processes of Extracting Gold, Silver and Copper from their Ores; and I do hereby declare the following to be a full, clear, and exact description of the invention, such as will enable others skilled in the art to which it appertains to make and use the same.

The object of this invention is to extract certain metals from their ores more effectually and at a reduced cost; and it consists in the processes hereinafter set forth, and finally embodied in the clauses of the claims.

To carry my invention into effect, I first grind or crush the ore containing the metal to be extracted to a powder of more or less fineness. This powder is then treated with certain salts in solution adapted to combine chemically with the metal in said ore and form therewith a soluble salt. After thorough agitation, to mix the solution with the ore, the mixture is allowed to stand until the solid matter is settled and the solution has become clear. I then suspend a piece or plate of zinc therein, which causes the metal dissolved in the salt solution to be precipitated thereon, from which it can be removed by scraping or by dissolving the zinc in sulphuric or hydrochloric acid. The precipitated metal may then be melted into a button.

The salt solution I use for dissolving the metal from the ore is composed of one pound of cyanide of potassium, one ounce carbonate of ammonia, one-half ounce chloride of sodium, and sixteen quarts of water, or other quantities in about the same proportions.

This solution is particularly adapted for ores containing gold, silver and copper in the form of sulphurets.

For an ore containing gold and copper only I use cyanide of potassium and carbonate of ammonia about in the proportions named.

For ores rich in silver I employ a proportionately larger quantity of chloride of sodium.

I am aware that cyanide of potassium, when used in connection with an electric current, has been used for dissolving metals, and also that zinc has been employed as a precipitant, and the use of these I do not wish to be understood as claiming, broadly.

I am also aware that carbonate of ammonia has been employed for dissolving such metals as are soluble in a solution thereof, and the use of this I do not claim; but what I claim as new is:

1. The process of separating gold and silver from their ores, which consists in subjecting the ore to the action of a solution of cyanide of potassium and carbonate of ammonia, and subsequently precipitating the dissolved metal, substantially as set forth.

2. The process ot separating metals from their ores, to wit: subjecting the ore to the action of a solution of cyanide of potassium, carbonate of ammonia, and chloride of sodium, and subsequently precipitating the dissolved metals.

In testimony that I claim the foregoing I have hereunto set my hand this 15th day of October, 1884.

JEROME W. SIMPSON.

Witnesses: Oliver Drake, Charles H. Pell.

THE Denver MacArthur-Forrest Co. make a charge of $10 per ton on all ore treated. The Secretary of the company says: "We cannot profitably conduct a custom mill in this city in competition with the extensive smelting plants that make Denver the greatest mining and milling center in the world. These smelter plants treat hundreds of tons of ore per day, and one, the Grant, is increasing its plant to treat 750 tons per day. They purchase such ores and tailings as we could successfully treat at a very low figure, in order to obtain them to use in fluxing other ores. They charge as low as $3 per ton for treating such ores, and in many instances, owing to market conditions, they have treated iron pyritions ores for nothing. We mean by this that they have paid the full assay value for the ores that they desired for fluxing purposes."

CYANIDE SUPPLY.—The Gold and Silver Extraction Co. of Denver, in its circular, has the following to say concerning the cyanide supply: We have given the question of cyanide supply very close attention. We opened up a very extensive correspondence with various chemical manufacturing companies in the United States. After much interchange of expression, we succeeded in making a satisfactory arrangement for a large and continuous supply of cyanide from one of the largest chemical manufacturing firms in this country, who control the cyanide and prussiate supply of the United States. They stand ready to supply orders promptly from tonnage up to carload lots. They promise to keep an abundant supply on hand to meet all requirements.

THE WINNIFRED DISTRICT.—A *Herald* reporter visited the Union mine yesterday for the purpose of seeing the cyanide process in actual operation, and was more than satisfied with the result. At present it is being worked on some low-grade tailings which do not average over $6 per ton, and even at this rate it is making money for the owners. Mr. J. C. Rankin says he will start up the mill the latter part of this week, and will have the entire plant in active operation. He is now engaging miners, and will have ten stamps dropping steadily in a short time.—Phœnix (A. T.) Herald, June 15th.

Long Distance Electric Power Transmission.

The most important electric power transmission plant yet undertaken in this country is one now in course of construction for the San Antonio Electric Light and Power Co. in Southern California. The power plant is located in the San Antonio canyon, where there is a minimum flow of 1300 cubic feet of water per minute, affording a head of about 400 feet.

The water is brought to the power station through 1900 feet of 30-inch and 600 feet of 24-inch double-riveted sheet iron pipe, which involves a loss of head by friction of 12 feet, leaving 390 feet effective head or running pressure. The laying of the pipe line necessitated a rock tunnel 1300 feet in length as well as several heavy open cuts. The power station is provided with four double-nozzle Pelton wheels 34 inches in in diameter, coupled direct to the armature shafts of as many Westinghouse alternating current generators of 200 horse power each. The wheels will run under above conditions 600 revolutions per minute, giving the same speed to the generators. Two exciters are provided, which are also run by Pelton wheels coupled to the shafts in the same manner, of 20 horse power each.

By means of transformers the potential will be raised to 10,000 volts, and the current at this pressure will be conveyed over bare hard-drawn copper wires to Pomona, a distance of 13 miles, and to San Bernardino, a distance of 23 miles, and is to be used for both light and power purposes.

This work is attracting much attention, more on account of the length of the circuit than of capacity, it being a longer distance than has heretofore been attempted in this country. There is, however, no occasion for any misgiving as to results, either from a practical or mechanical standpoint. So far as relates to the utilization of the water power and its electric transmission by means proposed, the reputation of the parties supplying the machinery is a guaranty of the success of any enterprise with which they may be connected.

"CYANIDE IS KING."

NEW MINING ERA.

OLD AND ABANDONED MINES CAN BE PROFITABLY WORKED

BY THE

MacArthur-Forrest Process

CONTROLLED BY

THE GOLD AND SILVER EXTRACTION MINING AND MILLING CO.

CAPITAL STOCK, $5,000,000. — 50,000 Shares, Par Value $100 Each; Full Paid and Non-Assessable.

THE MOST WONDERFUL PROCESS EVER DISCOVERED.

CHEAP, SIMPLE, EFFECTIVE. TITLE PERFECT—PROTECTION GUARANTEED.

Patents have been Granted in the following Countries, viz:

United States, No. 418,137, dated December 24, 1889; No. 403,202, May 14, 1889; and No. 418,138, December 24, 1889. England, No. 14,174, dated Oct. 19, 1887; in Cape of Good Hope, Africa, No. 6,101, dated Jan. 7, 1888; in Victoria, No. 5,572, dated Jan. 19, 1888; in New South Wales, No. 453, dated Jan. 21, 1888; in South Australia, No. 948, dated Jan. 23, 1888; in Tasmania, No. 529, dated Jan. 24, 1888; in New Zealand, No. 2,775, dated Feb. 1, 1888; in Canada, No. 28,471, dated Feb. 6, 1888; in France, No. 189,808, dated April 6, 1888; in Belgium, No. 82,673, dated July 24, 1888; in Brazil, No. 619, dated Aug. 23, 1888; in Portugal, No. 1,272, dated Aug. 30, 1888; in Italy, No. 23,852, dated Sept. 30, 1888; and in Spain, No. 8,533, dated October 2, 1888; also in Mexico, Germany and South American Republics. They control the Simpson patents, only granted in the United States.

HUNDREDS OF TESTIMONIAL LETTERS ON FILE.

Here are a few Sample Ones:

"I believe that I shall use the process extensively, and that it is the greatest revolution of the age and will "make the world $1,000,000,000 richer in the next ten to fifteen years."—A. H. JOCELYN, Editor *Daily Financial News and Record*, New York City.

"The cyanide process is making a gradual but steady advance both in practical results and favor."—*Engineering Magazine* of New York City for June, 1892.

"No metallurgical improvements of late years have attracted as much attention from the mining public as "the MacArthur-Forrest process, known also as the 'cyanide process.'"—*Mining and Scientific Press* of San Francisco, Cal., May 28, 1892.

"The Denver Mill is kept running night and day. The method is quite simple and easily understood. It is "most successful with free-milling and pyritious ores; tellurides, arsenical and silicious, both gold and silver, "manganese and some others."—*Mining Age*, Denver, Salt Lake City and San Francisco, June 11, 1892.

"Rest assured I am satisfied with the value of the process."—THOMAS JORDAN, Editor *Financial and Mining Record*, New York City, June 15, 1892.

"There can no longer be questioned the value of the MacArthur-Forrest process. It has proven its value by "practical demonstration."—*Colorado Graphic*, Feb. 13, 1892.

"Mining men all over the country are beginning to realize the marvelous possibilities of the cyanide process "for the extraction of gold and silver—technically known as the MacArthur-Forrest process. All over the West, "mills for the treatment of ores by this method are being erected, and practical miners are fast becoming alive to "the fact that in no other way can money be made so fast and so certainly as by thus treating their ore."—Denver *Daily Times*, March 16, 1892.

"During the past year the only process that has been demonstrated a complete success with the ores of this "county has been the MacArthur-Forrest process."—Boulder *Camera*, Jan. 1, 1892.

"The Livingstone people say that the MacArthur-Forrest process is a complete success on ore from that mine, "and the mill is running steadily night and day."—Boulder, Colo., *News*, Dec. 27, 1891.

"A new era in mining seems to be drawing upon this section. The process known as the MacArthur-Forrest "cyanide process bids fair to supercede all other methods."—*Arizona Journal Miner*, March 26, 1892.

"The last one hundred-ton cleanup at Calumet Mill, on the new cyanide process, is the most satisfactory yet "made, the returns being over 90 per cent of the value."—*Free Press*, Redding, Cal., April 2, 1892.

Speaking of operations in South Africa, *London Truth*, under date April 28, 1892, refers to the MacArthur-Forrest process as follows:

"Arrangements have been made for the treatment of the large reserve of tailings, exceeding 200,000 tons, by "means of the MacArthur-Forrest cyanide process, and the necessary plant will be erected during the early part "of 1892. The plant will be capable of treating from eight to twelve thousand tons per month, and from the "working of this they expected very profitable results. It is the biggest plant of the kind in the world."

"The African Gold Recovery Co. (Ltd) have received cable news that 13,500 ozs. of gold had been recovered at the Randt by the MacArthur-Forrest process during April."—Glasgow (Scotland) *Herald*, May 13, 1892.

"The wonderful success of all the new mills recently established in the gold fields of the West, which have "adopted the new process, is a sufficient guarantee that the MacArthur-Forrest process is the proper method for "the extraction of the precious minerals from ores in this locality. No other known method will do it so cheaply "and so thoroughly. While the old methods rarely save more than one-fourth or one-half of the gold and silver, "the new cyanide process will save from 90 to 93 per cent of all the ore contains. Practical miners and capitalists "are purchasing rights and erecting plants all over the land."—*California Farmer, Miner and Oil Reporter*, Los Angeles, May 28, 1892.

"The owners of these (MacArthur-Forrest) rights for the United States, however, do not set up the claim that "this method of treatment is adapted or adaptable to all varieties of ores. They invite every one to make a rigid "examination of the mill and of all tests from the beginning to the end. There are no secrets, no concealments. "They will not permit its use in the reduction of ores until its adaptability to them has been fully and satisfactorily demonstrated."—*Mining Age*, Denver, Salt Lake and San Francisco, June 11, 1892.

"S. B. Milner, President of the Gold Extracting Co. of Bingham, came in last night. He is in excellent spirits "over the results of the trial run of their new mill, using the cyanide process of ore reduction, which, he says, "demonstrates the fact that the enterprise will prove an overwhelming success."—Salt Lake *Journal*, May 28, 1892.

"The Gold and Silver Extraction M. and M. Co. is making very rapid strides indeed, and have reason to feel "proud of the success they are achieving."—*Daily Mining Exchange Journal*, Feb. 12, 1892.

The Mercur Gold Mining Co., at Fairfield, Utah, is working 50 tons per day. We quote the following extract from a letter written by Mr. Gill S. Peyton, Manager, dated April 19th:

"Comparative results by actual experience on our ore by amalgamation and the MacArthur-Forrest process are as follows:

"Fifteen hundred tons of ore treated by amalgamation gave an average extraction of 20 per cent at a cost of "$4.25 per ton for milling. Sixteen hundred tons of ore treated the past 90 days by the MacArthur-Forrest "process, average extraction of 88 5-10 per cent at a cost per ton of $2.25 for milling.

"Our appreciation of the process is fully demonstrated by the fact that during the month of March we increased our capacity, as before stated, to 50 tons per day. The last 16 days I have made over 100 tests on refractory low-grade gold and silver ores from different parts of the county, and my experience so far has been that "the greater number of them can be worked to a high percentage by the MacArthur-Forrest process."

MILLS IN OPERATION AS FOLLOWS, VIZ.:

CALUMET GOLD MINING CO.....Middle Creek, Shasta Co., Cal.
THE SHASTA GOLD EXTRACTING CO.....Middle Creek, Shasta Co., Cal.
THE MERCUR GOLD MINING CO.....Fairfield, Utah
THE BINGHAM GOLD EXTRACTING CO.....Bingham, Utah
THE NEEDLES REDUCTION CO.....Needles, San Bernardino Co., Cal.
THE PACIFIC GOLD AND SILVER EXTRACTION CO.....Oro Grande, San Bernardino Co., Cal.
THE ORA BELLA GOLD MINING CO.....Yavapai Co., Arizona
THE CROWNED KING AND LAST CHANCE MINES.....Yavapai Co., Arizona
TAE UNION MINE.....Maricopa Co., Arizona
THE REVENUE GOLD MINING CO.....Revenue, via Norrie, Madison Co., Mont.
THE IDAHO GOLD EXTRACTING CO.....Quartzburg, Idaho
AND OTHERS IN COURSE OF ERECTION.

THE OBJECT OF THIS COMPANY IS TO INTRODUCE THE MacARTHUR-FORREST PROCESS.

They have purchased from the Cassel Gold Extracting Company, of Glasgow, Scotland, the exclusive rights for the United States to use the patents covering the process.

If you desire an experimental test, communicate with the General Manager. If the results of a test are favorable, they will then make arrangements to treat a carload or more.

They are fully prepared to grant royalties to mine and mill owners, or rights covering districts and counties.

A few tubs especially constructed according to their diagrams, for triturating, settling, and filtering, is all that is required extra in connection with any kind of pulverizing stamps or rolls. The total cost, as a rule, does not exceed from $1.50 to $5.00 per ton.

The most desirable class of ores for this process are the so-called refractory gold and silver ores, pyrites, Hermatites, manganese, sulphides, sulphurets and tellurium. They have also treated successfully dry silver ores.

They will be pleased to answer all inquiries and furnish any desired information. Will supply descriptive literature on request.

P. O. BOX 926.

Address T. L. WISWALL, General Manager and Secretary.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned

CALIFORNIA.

Amador.

KEYSTONE.—Amsdor *Ledger*, June 25: The erection of the new hoist at the 1400-foot level at the Keystone is completed and hoisting from the winze has been commenced. The underground engineers are Chas. Berryman and Nick Gray. Sinking is going on rspidly with ths eight-hour system snd four men on a shift. John McLaughlin came down from Chichizola's mill yesterday snd reports that the mill started up ths beg nning of the week. About 16 hands are employed st present.

CLEAN-UP.—Clesning-up operations at the Grass Valley hydraulic claim were completed last week, and the hullion was shipped to San Francisco on Fridsy. This is the final clean-up, all the auriferous ground belonging to the compsny heing worked out. The yield is not definitely known on the outside. It is variously estimated between $15,000 and $20,000, which would make a very satisfactory sesson's run. Unless other ground csn be secured the company's work in this locality must cease. They have another claim, however, near Volcano, and it is probsble that the pipes and giants will bs removed to this claim. At the Bright mine they ars still waiting for timbers to enable them to proceed with sinking operstions. At ths Hsrdenhurgh it is ssid to be the intention of sinking 200 feet deeper. At the Clinton Consolidated at the 300-foot level the ore body is reported to he widening ont agsin, aud snother rich spot in ths ledge was struck a few dsys sgo. A hrsak or slip in the ledge was met with two weeks ago, which gave rise to the ides in ths minds of some that the ore body had pinched out. This impression, however, ws are plessed to say was entirely erroneous. The sulphurets works are running full hlast. Ths working force employed hy the company is 10 or 12 less thsn formerly, on account of the smployment of the mschine drills.

Butte.

BLUA LEAD MINES.—Oroville *Register*, June 23: Dr. Allen of Bangor was in town on Tuesday, and, speaking of ths blus lesd mines at that plsce, ssid everything was looking encoursging. The Cstskill Co. hsd a shsft down 142 feet, snd had rnn a tunnel about 100 feet from ths bottom of ths shaft. They had to hoist their pay dirt, pnmp water and force sir down a four-foot shaft, and thus worked under some dissdvantages. The bed of gravel wss about 20 feet in depth, and wss paying well. Ths chsnnel wss wide, and the bed promised to last for years. He heard it said that for the seven days' run, ending on Sunday, the compsny had clesned up $1500, but he could not tell whether this was true or not. The cement had to be blasted with gisnt powder and then run through an arrastre. The owners of ths Bishop mine hsd things about ready to strt up. They hsd new and good mschinery, and would work rspidly as soon as they hegun to raise dirt. They had steam power srrastres like the Catskill Co., hut owing to mors favorable conditions, he thought they would hs ahle to crush more cement per day to the man. Hsys & Clark have a good prospect, and will probshly get rich returns. They have struck the hlue lesd on Capt. J. W. Smith's land near ths Kentucky ranch, snd hsve run quite a cnt there by means of wster brought from the North Honcut. Dr. Allen is convinced that these mines ars extensivs and permanent. There are nearly 50 men now employed, and a larger number will he added as new mines are opened and the present ones hsve greater facilities for getting out cement and crushing it.

El Dorado.

ELEVATOR.—Georgetown *Gazette*: The hydraulic elevator at Mammoth Bsr, under msusgement of Col. Davis, started up lsst Sstnrday. John C. Rich of Georgetown, ths veteran miner aud mine superintendent, has resumed his old position on the miue.

Kern.

THE NEW SILVEE MINES.—Bakersfield *Californian*, June 25: The veins that srs heing opened in Agua Caliente district hy Andy Sauser, still continue very rich. Samples thst he recently sent to Los Angeles, returned an assay value of $2300 per ton. He has recently sold two of these mines to Los Angeles capitalists, who are greatly pleased with their bargain. Quite a number of mining men are examining the ne silver region, and thus far all report in the very highest terms concerning it. From arrangements recently made it seems likely that two new mills will shortly he erected in that locality.

Lassen.

A RICH STEIKA REPOETEN.—Lassen *Mail*, June 25: It is reported that a rich striks was made last Saturday in the quartz mine belonging to Wm. Long and others, who have heen running tunnels and prospecting for a long time on Diamond mountain, about five miles south of Susanville. From the meagre information thus far obtained, it appears that a ledgs soms three feet thick has been struck, one foot of which is literally filled with gold, visihle to the naked eye, while the remaining portion is very rich. Outside of this they have an immense ledge which assays largely in gold aud silver.

Los Angeles.

SAN GABEIEL CANYON MINAS.—Covina *Argus*, June 25: The placer mines of the San Gabriel are yielding good pay for the intelligent labor hestowed upon them, and a gentleman who knows says that if they were this side of the mountains the hill would all he washed away in a short time. The Kelsey M. Co., located five miles up the river, is shipping another carload of exceedingly rich ore. It is reported that a carload of similar ore sent away last month yielded returns of near $65,000.

Mono.

BONIE CON.—*Miner*, June 25: Esst crosscut No. 1, 550-foot level, wss extended 6 feet. North drift from shove crosscut wss extended 9 feet. We started an npraise on a 6-inch sesm of ore from above drift. Upraise, 400-foot level, was extended 6 feet. The ore in fsce is from 6 to 8 inches, of f. ir milling.

MONO.—During the past week ws made ths air connection with No. 1 npraise, 60 feet above the 600-foot level, and extended the ssme 7 fest.

Nevada.

THE YELLOW DIAMONN.—Nevada *Herald*, Jnne 23: The formation in the Yellow Dismond shsft is now eight feet wide, and the owners expect to get a good ledge. A pump bss beeu put into the shaft, and a light hoisting rig is being huilt at the Nevads Foundry. Water power hss heen brought in, and two Pelton wheels will he set up—one for ths pump and one for the hoist. Two shifts are working, and ths shaft is going down rapidly.

DEIFT GRAVEL MINING.—Grass Valley *Tidings*, June 25: Interest in this branch of mining has grestly revived since ths profitable channel in ths Harmony and West Hsrmony mines near Nevads City was cut. Ths gravel yields from $10 to $13 hy mill process, and both mines are to havs ten-stamp mills put on thsm at once. W. W. Stow and B. J. Watson are so pleased with their success in the West Harmony that they have arranged with M. L. Marsh to open up a tract of ground owned by him, and situated on the same ridge hut a mile farther east. It is believed the same channel will he cut there. Mr. Marsh, by the wsy, is to be credited with much of the honor attaching to the development of this profitahle channel, as he, almost unsided, opened ths Harmony.

OELEANS MINA.—Grass Valley *Telegraph*, Juue 25: The Orleans mine, of which Ambross Powning is superintendent, has its hoisting and pumping works all completed, snd a start-up has been made. Everything works well. Sinking in ths mine hss been beguu. It is expected that the valushle Rush and Laton ground will soon he reached. The Orleans is now taking ors from the winze, and a crushing will soon he had. Several crushings heretofore made hsve turned out in a way to justify all ths expenditures contemplated.

Plumas.

BIO NUOOET.—Plumas Co. *Bulletin*, Juns 23: Last week, Hewitt Bros., in the old Gould & Spencer mins near Gibsonvills, found a largs boulder of gold with some quartz mixed in it. It is somewhat ohlong in shsps and weighs 22 pounds, and is estimated to contaiu between $1200 and $1500 in gold. This spot seems prolific of such nuggets. About 15 years ago, J. E. Perry, our informsnt, says a similar nugget worth $1500 wss found. Flattering reports come to hand with referencs to the prospects in the Roedds & Stampfli mine near Soda Bar.

San Bernardino.

SILVEE REAF DISTEICT.—Los Angeles *Express*, June 24: S. S. Nowlin, secretary of the Riverside Silver Development Co., was in Los Angeles yesterday with some specially encoursging news. Ths compsny was incorporated last December, W. A. Hayt president, with $1,000,000 capital, and ths stock hss steadily raised from 20 cents on the dollar to psr. The shaft in the Silver Reef district iu Ssu Bernardino county is now more than 100 feet deep. There are several tunnels from 60 to 70 feet deep, all developing ors of high grade, some of it running as high ss $600 to ths ton. A ten-foot vein of the $500 ore has been found. John S. Reece is superintending the mine and developiog it as fast as possible. The old Msssadonia mine, so well known 30 yesrs ago, was supposed to have been found a few weeks ago, and late news verifies the statement, for the old shaft has now been located, although there was little trace of it, ss it was so nearly filled np. The shaft has now been cleaned out and found to be only 40 feet deep aud a drift of teu feet running off from tie shaft, revealing a body of vsry rich ors, snd still not through the vein. The men 30 yesrs ago were all either killed or driven away by Indians, and their old tools were fouud last week in the bottom of the old shaft.

Sonoma.

PEOSPECTINO.—*Calistogian* June 23: Miners are prospecting a clsim west of Healdsburg which will probahly result in loss to the persons who furnish the money. The drift toward the ledge has been extended 200 feet, aud it is expected that the ore vein will soon be cut. The assays of surface rock show that it contains, to the ton, 25 cents in silver and $5.17 in gold.

Tuolumne.

NOTES.—*Independent*, June 25: It was J. D. Sullick who found the bnnch of gold in Wolfling's land, aud the amount was 74 ounces. J. E. Donohue, the popular superintendent of the Buchanan mine, was in town last Saturday. Some very rich ore has recently heen strnck at the Buchanan, and it is being worked thoronghly and systematically. Gus. Wedekind, who has been miuing under the lava ou Engelke's Gulch, receutly ran a uew drift and got into pay gravel. He is now taking out about $8 a day, with a good prospect for something hetter. Gale and Lawson have been driving an air shaft in their pocket-mine at Thompson's Hill. They are now about ready to commence work on the veiu. This mine has already furnished several pockets, and Gale and Lawson will no douht be able to locate one. In the article copied last week it was stated that the Bonanza mine was owned by Olivsr, Johnson & Kelley. This was an error. The property is owned hy M. B. Harriman, E. Keil, D. Oliver, A. P. Johnson aud Bsit Divoll. Mr. Divoll's interest is lessed hy the parties first named. Charley Smith and Johu Ferguson have secured a lease of a portiou of L. R. Peterson's pocket mine on the summit of Yankes Hill. A great mauy thousands of dollars have already been taken from this miue. Ths vein was discovered iu early days, by miners who were placering. They followed the float gold right np to the vein, getting nuggets ss big as $500. The vein has been owned by ssven or eight different parties. Abont ths time one party concludes it is worked out, another comes along and gets a pocket out of it. Smith and Fergnson have two men at work, aud expect to find something shortly, the indicatious being very good.

Trinity.

WORK RESUMAU.—Trinity *Journal*, Juns 28: James A. Johnston is about to open np ths Bullychoop property again. He is getting a bond on the entire mine that he is interested in, and will begin work as soon as practicshls. He will extend the present tunnel some distance farther and cut the ledge if it is there.

CANON CBAAK.—Ths mines in this camp are looking quite encouraging. The Chloride Co. has opened np a new pay chuts, ths Bailey meu have struck some $100 rock, and the Msple is putting up an arrastrs to crush six tons a day. The mines in this section never, as a whole, looked more prosperous. C. C. Shattuck is running a tunnel to tap ths Buck's Rauch ledge at a lower level, where he sxpscts to find good ore.

NEW RIVEE.—Cor. Weaverville *Journal*, Juue 25: The mines are about the same. On ths Sherwood mine, Leas & Nicholson made a clean-np of a small run, ths other day, of ovsr $2000. Miller & Stone are now making a rnn from the same mins of about 75 tons that will go over $50 to the ton.

NEVADA.

Washoe District.

CONS. CAL. ANU VIAGINIA. — *Chronicle*, June 25: There has been extracted from all parts of the mine, during the week, 998 420-2000 tons of ors which was shipped to the Morgan mill, the average value of which, per csr sample, was $25.95 per tou. The avsrage assay vslne of all the ore worked at that mill during the week, 980 tons, was $23.41 per ton, per battery samples. Thsre was worked at the Vivian mill during the week 230 tons of ore, the aversge assay value of which, per battery samples, was $18.68 per ton. Bullion shipped to Carsou Mint, assay valne, $17,034.22. Bullion shipped to the company's office iu San Francisco, assay vslue, $1534.98.

MEXICAN.—On the 1465 level, ths drift running north from ths crosscut run east from the hottom of the winze snnk 101 feet below the sill floor of this level, near ths sonth honndary of the mine, at a point 40 feet esst from the winze, has been advanced 20 feet; total length 101 feet; continuiug in a porphyry formation, showing fine lines of qnartz and soms clsy.

UTAH.—The west crosscut No. 1 from ths north drift, 1340 level, from ths west crosscut from the shaft station, has a total lsngth of 120 feet; cutting through clay and quartz of very low assay valne. Resnmed work in the uorth drift, startiug at a poiut 267 feet from ths main west drift; it has been sxtended a total length of 301 feet; formation continues in porphyry, with small stresks of quartz.

SIAERA NEVAUA.—Sincs last report we have suspended work in west crosscnt No. 1, which was advanced 40 feet; fscs in porphyry and streaks of quartz.

GOULU & CUREY.—On ths Sntro tnnnel level, ths joint npraise with the Ssvage Company has heeu carried up a distancs of 15 fest during the week; total height 110 feet; face in porphyry and stringers of quartz.

HALE & NOECROSS.—Have men on repsirs in ths msin shaft and at other points in the mine where necessary. Of the ore remaiuing in the ore house at the time we ceased sxtraction, tbers has been shipped to ths Brnnswick mill 416 850-2000 tons; average railroad car samples of same, $16.72. This ore has remained in the ore house for a very long time. To-morrow's shipment will clean ont the ore house complstely. Aversge hsttery assay for the week, $12.70. No returns have been received of the hullion seut to the U. S. Mint at Csrson last week, ss ths Mint is making its annual cleanup.

POTOSI.—We have extracted and ssnt to ths mill in the past week 495 1100-2000 tons of ore from the 930, 1000, 1100, 1150 and 1200 lsvels. Milled during ths week 455 tons. On hand at mill, 120½ tons; average battery assay, $22.08; averags car sample assay, $26.09. Sent to the Carson Mint 397 pounds of crude bullion.

BULLION.—The joint Potosi wiuze is down 402 feet helow the 1500 level; bottom in low-grade quartz. The south drift, 1500 level, is out 547 feet sonth of north line; face in porphyry.

OCCIDANTAL.—Have extracted from the 350, 400 and 450 levels 180 tons of ore of the average value of $26 71 as per car samples. Milled dnring the week 182 tons of the average value of $23.10 as per hattsry samples. The Zadig drift from the Sutro tunnel has beeu extended 23 feet; total, 661 fest.

Columbus District.

WOEK TO EE RESUMED.—Walker Lake *Bulletin*, Juue 23: Supt. Shockley of the Mt. Diablo company advertises for 50 miners to work in the Mt. Diablo mine; wages $3 per day. Work will be resumsd in the mine on or about the 1st of July. Captain Fleming, foreman of the company's mill at Sodaville, put some men to work on Saturday. The mill will be in readiness to drop stamps in a week. There is a general rejoicing in all parts of ths county on acconut of the resumption of work in the Diablo, and it is the general hope and belief that the Holmes compsny will resume work very soon. Snperintendents Jackson and Shockley are expected daily from California.

Tuscarora District.

NAVAJO.—*Times-Review*, June 24: North intermediate drift above the 350 foot level has heen exteuded 15 feet aud is still showing some good ore in ths fsce.

BELLE ISLE.—West crosscnt, 250 foot levsl, extended six feet, cutting a small vein giving good assays. South drift, same level, extended 10 feet, showing spots of good ore. Upraise on the east vein, 350 foot levsl, extended 12 feet, with no change.

ARIZONA.

HILLSIUE.—*Journal-Miner*, June 25: The new owners of the Hillsids mins are pushing work actively on the property. Col. A. O. Brodie has been employed by the compauy to put in quite a large dam to stors water for the use nf the company. Ths Old Relishle mine is heing worked hy a largs forcs of men under ths foremanship of Ed. Zimmermsn, a thorongh and competent miner. Thsy are developing the mine and taking ont rich ore on the lower lsvel. There is from 16 inches to 2 feet of ore, assaying from $25 to $50 per ton. Ths mill is kept runniug day and night on ors that is being taken out, the ors being free-milling gold ore.

COLORADO.

MINARS' WAGES.—*Mining and Scientific Review*, June 25: The reduction of miners' wsges throughout ths Red mountsin minss amonnts to about 33⅓ cents a day. The cut seems to have heen necessitated by ths increased cost of miuing, the low price of silver and higher transportation charges than any other section pays.

HILL TOP DISTRICT, uow called Dolomite, is occupied by miners from Aspen and Leadvills, who expect to develop some extensive deposits of carhonate ore, rich in silver. Not much beyond assessment work has yet hesn done. The formatiou and the ors seem to he almost identical with the main features of Aspen mountsin. If it shall provs to hs a largs and good field, hoth the Midland and South Park rsilroads could huild hranches at very little tronhle aud expeuse. Ths camp is wsll situated iu the Sonth Psrk and within easy distance of Pueblo, Denver and Leadville.

IDAHO.

DEVELOPMENT WORK.— *World*, June 20: Work has begun on ths shaft on the Bella location ou Crooked creek, in Beaver district. Matt Graham received the contract to sink 200 feet. This is one of the locations for the development of which John Henry has secured Eastern capital. Work has commenced on another shaft on a new location—ths Edna—located by Mr. Heury, and is about half a mils from ths Bella. This ledge is 60 feet wide, with rich stringers of silver ore through it. This shaft will be sunk 50 or 100 feet, and if ths showing at that depth will justify mors extensive development, a tnnnel will hs run to cut ths ledge at the depth of 300 feet. The tuunel will hs four or five hundred feet in length. This is one of the strongest ledges in the county, and carries ore that will run 1000 ounces silver per ton. If, with dsvelopment, it proves to bs as good as expectations pictnrs it, ou the strength of surfsce showings and cropping promises, such as seldom fail, ths Edna will develop into ons of the hig bonanzss of the State. The croppings are much better thau thoss of the DeLsmar, now unsurpassed by any mine in the world, aud its sizs almost equals the immense proportions of that famous mine.

OREGON.

NEW MINE AT OSWAOO.—Oregon City *Enterprise*, June 26: Ths Oregon Iron & Steel Co. is dsveloping a new iron mins on its property uear Oswego. This mins hss a five-foot vein of black magnetic iron ors that assays from 50 to 65 per cent metallic iron—shout douhle the richness of the old hematite mine and of ths kind needed in the smelting business in ordsr to mske the product what it should he. It has been necessary heretofore to import all the magnetic ore used. The new mine is on the south sids of the track and is shout a third of a mile uearer ths smelter than the old mines. It is nearly on a level with the railrosd track, and uot more than 100 yards from it.

WASHINGTON.

SWAUK MINES.—Cor. *Capital*, Jnne 25: Never in ths history of the camp has so much work beeu in progress as is going on now. One good featnre is that it is not all prospecting. Many of the miners stayed by their claims all winter getting them ready for active operations, and the result is that there are more producsrs now than ever hefore, and the returns are generally satisfactory. Water is still plentiful, and it bids fair to hnld out well. The cleanup of 145 ounces of gold hy Peterson and Tweet, valned at $2320, has heen mentioned. They are at work on another cleanup. York, who has 13 tons of rock on his dump, will finish his clean-up about the 1st of July; and judging by looks, he will secure at least $1300, and perhaps more. The Gold Leaf finished cleaning up lsst Saturday, and the rock averaged $39.50 per ton in free gold. Virden is keeping one stamp busy on his claim, and is cleaning up abont $10 a day. B. C. Pitcher is still piping on the old Black claim and expects to keep at it as long as the water lasts. Ben Hanson has struck a fins prospect on Boulder creek, which shows a ledge over 5½ feet wide, carrying free gold. Tacoma parties now have a hond on the property. The Spokane Co. has just cleaned np abont 40 ounces on a 20 days' hydraulic run. Work is being pushed on the Bnckhorn, which is considered by many the finest property in the camp. A force of men is at work sinking a shaft on the vein which is seven feet wide between the finest kind of walls, and it carries free gold, scarcely a hncket full coming out in which some of the precions metal caunot be seeu.

A NEW BOOK ON ASSAYING.

THE BEST IN THE ENGLISH LANGUAGE.

IT LEADS ALL OTHERS!

RECENTLY PUBLISHED.

THE ASSAYER'S MANUAL.

An Abridged Treatise on the Docimastic Examination of Ores, and Furnace and other Artificial Products. By BRUNO KERL, Professor to the Royal School of Mines; Member of the Royal Technical Commission for the Industries, and of the Imperial Patent office, Berlin. Translated from the German by WILLIAM T. BRANNT, Editor of "The Techno Chemical Receipt Book," etc. Second American Edition. Edited with extensive additions by F. LYNWOOD GARRISON, Member of the Am. Institute of Mining Engineers, Iron and Steel Institute, Verein Deutscher Eisenhuttenleute, etc. Illustrated by 87 Engravings. Three hundred and fifty-four pages, 8vo. cloth, price $3.00. *By mail, free of postage, to any address in the world.*

Abstract of Contents: GENERAL DIVISION.—I. Mechanical Manipulations; II, Chemical Operations; III, Assay Furnaces; IV, Assay Vessels; V, Balances and Weights; VI, Tools and Implements; VII, Assay Reagents. SPECIAL DIVISION.—I, Lead; II, Copper; III, Silver; IV, Gold; V, Platinum; VI, Nickel; VII, Cobalt; VIII, Zinc; IX, Cadmium; X, Tin; XI, Bismuth; XII, Mercury; XIII, Antimony; XIV, Arsenic; XV, Uranium; XVI, Tungsten; XVII, Chromium; XVIII, Manganese; XIX, Sulphur; XX, Fuel; Appendix; Index.

☞ *A circular of 8 pages, quarto, giving the full Table of Contents of this important Book, as well as a new List of Leading Books on Metal-Mining, Metallurgy, Mineralogy, Assaying, Chemical Analysis, etc., sent free to any one in any part of the world who will apply*

☞ *The above or any of our Books sent by mail, free of postage, at the publication price, to any address in the world.*

☞ *Our new and revised Catalogue of Practical and Scientific Books, 88 pages, 8vo, and our other Catalogues, the whole covering every branch of Science applied to the Arts, sent free and free of postage to any one in any part of the world who will furnish us with his address.*

MECHANICAL PROGRESS.

Galvanized Iron.

HOW THE IRON IS PREPARED AND COATED.

To many not familiar with the subject, says the *Manufacturers' Gazette*, the name given to iron which has been coated with tin or zinc is misleading, as there is no galvanic process employed, the iron simply being coated by a dipping process.

Although the process of galvanizing iron to prevent rusting is practiced on a very extensive scale, no radical changes have been made in the method by which it is done.

A French chemist states that a plan or process of coating iron with zinc was known and practiced as far back as 1742, and the fact is further established in a paper upon the subject contained in Bishop Watson's Chemical Essay, published in 1786, describing the process, which is practically the same as that in use at the present time.

Several patents have been secured for a galvanizing process. The first of these was granted to H. W. Craufurd, an Englishman, in 1837.

The process employed by Craufurd was as follows: The iron is first subjected to a pickling process, to remove all scale or rust, the iron being immersed in a dilute solution of sulphuric or hydrochloric acid, either hot or cold, preference being in favor of the heated bath.

After remaining in the acid bath sufficiently long to remove all foreign matter, the iron is removed and thoroughly rinsed in cold water, scoured with sand, and again rinsed.

It is then ready for the coating and is placed in a zinc bath, which is prepared by melting zinc coated with a thick layer of dry sal ammoniac, the sal ammoniac being used to form a viscid coating, which prevents the molten metal from rapid oxidation.

Small articles are treated in the same way, but as they are found to be soldered together when taken from the zinc bath, it is necessary to put them through another process to separate them. They are placed in a cylinder or crucible with charcoal powder, and while subjected to a considerable heat are shaken and thus separated.

The purer the zinc the better the result. Mallett recommends an amalgam of zinc 2292, mercury 202, and about one of sodium or potassium. This melts at 680° F., and into this the iron is dipped, being removed when it reaches the temperature of the alloy.

As above stated, there has been very little progress made in the art and the process is practically the same to-day, except that different concerns have methods of their own for doing the work.

There is a chance for development in this line of depositing a coating, and now that electricity is being used so extensively in similar processes, it seems probable that it will be adapted to plating or coating iron with zinc, and even to the manufacture of tin plates.

Experiments have been made in this direction, and the results justify the opinion that the old process will be improved upon and so simplified as to reduce considerably the expense.

We have seen iron pipes and plates coated with lead, tin and zinc by an electrical process similar to that used in copper or electroplating, and which for almost every use to which iron so coated is put is far superior to galvanized iron by the present process, besides being very much less expensive.

The Eastern Pig Iron Situation.

While for many months past, says *Iron Age*, sellers of relatively unknown brands of pig iron in the Eastern markets have been forced to make sacrifice sales again and again, the signs are accumulating that standard Northern brands will soon give way. A number of Pennsylvania furnacemen, realizing the gravity of the situation, have been tentatively discussing the chances of a closing down of a certain proportion of the blast furnaces making iron for the open market. We understand that the banking or blowing out of one-half of the stacks now active has been suggested. Thus far these proposals have not met with an enthusiastic reception. A good many difficulties stand in the way. Some of the plants are operating only one furnace, and they, of course, could not take half measures. Larger plants might put furnaces on the idle list, and yet drive the active ones a little faster. Then, too, concerted action on the part of the Pennsylvania stacks would only afford welcome relief to the producers in other sections. The Southern furnaces would direct increased tonnage into the markets of New England and the Eastern States and the effect of the threatened strike in the Western rolling mills would have less terror for the furnaces which supply that market. A certain quantity of pig iron which ordinarily would go to Western steel works might seek an outlet in the Eastern foundry and forge markets.

As a matter of fact, any prolonged stoppage of the Western mills would throw additional work on their Eastern competitors. In fact, consumers are even now beginning to discriminate in their favor. This must help the Eastern furnacemen to some extent.

The chances are, however, that the cutting in prices on standard brands will lead to a sharp reduction in the quotation of the leading producer, which will establish a lower basis on the highest class of Northern brands and will render it all the more difficult for other irons to find a sale in this territory.

One-sided Tests.

But very little credit is given now-a-days to one-sided tests of machinery and engineering appliances. Some of these tests are no doubt made for advertising purposes. Instances sometimes occur in which one party sets forth the results of, say, a boiler test, showing remarkable results—often beyond the limits of possibility. Then, not to be outdone, a rival makes a test that gives a little better results, and so it goes; but, as intimated, the public is becoming skeptical in such matters, and, of course, engineers give no credit to the published statements.

In many instances the tests may be made with every intention of honesty, and still be far from correct. There is not a shadow of doubt that it is the easiest thing in the world for a man to "fool himself" if he is an interested party.

In the test of anything about which there is so much complication, and so many chances for error as there is in the instance of steam engines and boilers, no one without considerable experience in making such tests, and who is absolutely without prejudice, is competent authority. The party who pays the coal bills may know how much coal is used in a month or in a year, and the indicated power developed may be pretty accurately determined without the exercise of a great deal of skill of a high character. And this is a very good test indeed of the entire plant. But when it comes to making tests to determine the possibility of economy in a few hours' run, obtaining, perhaps, the economy of boiler and engine separately, the question is quite another one; such tests will not now be accepted except upon undoubted authority, and the publication of anything less carries very little weight.—American Machinist.

Machinery for Sale

FOR SALE CHEAP.

One 80-H. P. Taylor Beck High Speed Engine, in use but four months; 11½x15—replaced on account of size by 200 H. P. Ball Engine, at power house of Santa Cruz Electric Railroad. In first-class condition.

SCIENTIFIC PROGRESS.

The Limits of High Potential Transmission.

In discussing the subject of the practical limits of high potentials for the transmission of power, a foreign contemporary quotes from some articles published in one of our recent issues, and calls attention to the fact that too much haste ought not to be made in predicting the possibities of the future in the use made of exceedingly high potentials. The author, presumably Mr. Hospitalier, claims that our present knowledge of the action of currents at high potentials is not sufficient to enable us to predict with certainty just how currents and insulators will behave at potentials far exceeding those with which experiments and actual trials have been made. In this he confirms our editorial comments of some weeks ago. He quotes Mascart and others as having shown that it is impossible to get such high potentials as 500,000 volts in air under ordinary conditions of temperature and pressure, no matter what the distance between the electrodes is. He states that according to Mascart the striking distance between two spheres 22 millimeters in diameter is nearly proportional to the voltage up to a distance of two centimeters, but that beyond this the voltage increases more slowly than the distance; for instance, at 10 centimeters it is 119,000 and at 15 ooly 127,800, an increase of only about seven per cent, although the distance is 50 per cent greater. From a continuation of the curve drawn through the results obtained, he deduces the fact that the limit in air tends toward a point probably within 150,000 volts, and this is the same for a few centimeters or for many kilometers. Although objections might be made to thus continue the curve, yet he thinks that up to striking distances of one meter the curves can be relied upon. He considers it absurd to talk of using potentials of two and three million volts on bare wires in the air, as such potentials would, according to Prof. Owens, of the Nebraska University, be capable of sparking around the world. He admits that much higher potentials can be used in oil than air, but states that it is by no means certain that oil, as an insulator, has all the advaotages that have been attributed to it somewhat prematurely; it appears to offer much more disruptive resistance to alternating currents of the frequency of 100 to 150 volts, than to those of greater frequency, being almost the same as in air. He thinks that 40,000 to 50,000 volts is the extreme limit possible to-day for transmission to great distances. Beyond these figures he claims that projects can exist only in fancy and on paper. We agree with him that high potential enthusiasts should he warned not to proceed too fast, hut add that in view of the present tendency in the direction of usiog high potentials, it would be very desirable to establish the limits more definitely by experiments.—Electrical World.

MODERN BULLETS.—Prof. Bardeleben has recently delivered an address in Berlin on the modern bullet (*British Medical Journal*, May 21st). The modern rifle sends a bullet with a narrow cylindrical form and poioted apex, which at a distance of 1000 meters has the power to pass through several human hodies or to disable two horses. Its line of flight differs but slightly from the line of sight. It has an inner core of lead inclosed in a casing of steel which prevents the lead from becoming deformed and spreading at the point of contact. This change is of much interest for military surgery. The hullet is lighter than any of the lead bullets, but is sent with a greater velocity. On account of its velocity and its small surface of contact, it merely punches out a hole, causing very little commotion of the neighboring parts. It is more likely to cause fatal hemorrhage than the old bullet. If the new bullet wounds at all, it will have sufficient power to pass through any part of the body. Col. Boonen-Rivera, in his report on the civil war in Chili—the only war in which Mannlicher rifles have been used—says that the numher of dead on the battle-field was four times larger thao that of the wounded. The effect of these bullets on bone has been made the subject of a series of experiments. Up to a distance of 400 meters the bone is invariably shattered, and at greater distances either clean perforations or oblique fractures result. In the next war the ratio of recoveries of those who can be removed still living from the field will he larger than formerly. The new projectile is by no means so humane as it is sometimes called, since within similar periods of time, and under equal conditions, it kills and wounds more men than the old bullet. But the wounds which it causes, if they are not of a directly fatal nature, open to the surgeon, as a general rule, a far more promising field for exercising his skill and activity than those which were caused by the old bullet.

A NEW USE FOR OIL AT SEA.—The use of oil as a means of reducing the friction on the sides of a ship, caused by the passage of the ship through the water, and thereby increasing her speed, has been suggested. The idea embraces many featnres that would seem feasible, but whether or not it would practically make any difference remains to be seen. The oil is fed in minute streams against the sides of the vessel by means of a series of perforated pipes, adjusted to the bow and extending from the keel to the water line, or higher. The progression of the craft passes the oil back toward the stern, and at the same time the inward pressure of the water prevents the oil leaving the sides of the vessel without doing its duty. Perhaps the oil might be more thoroughly distributed were the ship huilt with grooves along the sides. Another suggestion is to submit the oil to a chemical treatment, whereby it would prevent weeds and barnacles adhering to the vessel's bottom, and thus increasing the scope of the oil's duties.

CHEMISTRY OF THE SECONDARY CELL.—A lengthy pager, detailing some long investigations on secondary cells, was read a short time back, before the Institution of Electrical Engineers, by Messrs. Gladstone and Hibbert. The deduction which these gentlemen draw from their experiments is that the various changes in the electromotive force of the secondary cell are due mainly, if not entirely, to variations in the density of the acid around the plates duriog charge and discharge. They were led to make these investigations owing to a paper read by Dr. Armstrong and Mr. Robertson before the Royal Society last summer, in which these geotlemen attributed an important part of these variations in electromotive force to the presence in the electrolyte of hydrogen dioxide and persulphuric acid. In the discussion which followed the reading of papers, Mr. Robertson was able to point out several facts which did not fit Messrs. Gladstone and Hibbert's theory. But it must be confessed that the contest between these electro-chemists remains at present a drawn battle. Each side has damaged its opponent's case, but has not succeeded in proving its own conteotion.

Assessment Notices.

GOULD & CURRY SILVER MINING COMPANY. Location of principal place of business, San Francisco, California; location of works, Virginia Storey County, Nevada.

Notice is hereby given that at a meeting of the Board of Trustees, held on the seventh (7th) day of June, 1892, an assessment (No. 69) of Twenty-five (25) Cents per share was levied upon the capital stock of the corporation, payable immediately in United Sta'es gold coin, to the Secretary, at the office of the company, Room 69 Nevada Block, No. 309 Montgomery Street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the twelfth (12th) day of July, 1892, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 4th day of August, 1892, to pay the delinquent assessment together with costs of advertising and expenses of sale.

By order of the Board of Trustees

ALFRED K. DURBROW, Secretary.

Office—Room No. 69 Nevada Block, No. 309 Montgomery Street, San Francisco, California.

THE BUTTE KING MINING COMPANY. LOCATION of principal place of business, San Francisco, Cal. Location of works, Butte County, Cal.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 4th day of June, 1892, an assessment (No. 4) of five cents per share, was levied upon the Capital Stock of the Corporation, payable immediately in U. S. Gold Coin, to the Secretary, at the office of the Company, 723 Market St., San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the 11th day of July, 1892, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on Tuesday, the 2d day of August, 1892, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors,

W. O. LEWIS, Secretary.

Office, 723 Market St., San Francisco, Cal.

TERIKOFF G. M. AND M. COMPANY. LOCATION of principal place of business, San Francisco, Cal. Location of works, Amador County, Cal.

Notice is hereby given that at a meeting of the Board of Directors, held on the 31st day of May, 1892, an assessment (No. 8) of one cent per share was levied upon the Capital Stock of the Corporation, payable immediately in U. S. Gold Coin, to the Secretary, at the office of the Company, 308 Pine St., San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the 6th day of July, 1892, will be delinquent, and advertised for sale at public auction, and, unless payment is made before, will be sold on Friday, the 29th day of July, 1892, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

SHEET IRON PIPE

IRON PIPE

ALL SIZES, FOR GAS, STEAM AND WATER.

— WE MANUFACTURE —

SHEET IRON AND STEEL PIPE,

ALL SIZES,

For Water Supply, Mining, Irrigating Purposes, Stock Ranches, Etc.

Made in Lengths Desired from 16 to 30 feet.

The Cut shows a Section of Three Joints

DOUBLE RIVETED SHEET IRON PIPE.

In the manufacture of this Pipe, we use only a high grade o annealed Charcoal Iron of great tensile strength.

The weight or thickness of metal used, is graded according to service required, and pressure to which the Pipe will he subjected.

FOR ALL UNDERGROUND PURPOSES, we immerse the Pipe in a bath containing a special mixture of ASPHALTUM, PITCH and PETROLEUM, at a Temperature of 300° Farenheit. It thus receives a thorough coating, both inside and outside, rendering it impervious to the alkalies of the earth, rust, etc., and is practically indestructible.

CORRUGATED IRON,

Black, Painted and Galvanized, for Roof and Sides of

HAY BARNS, DRY HOUSES, STABLES, ETC.

W. W. MONTAGUE & CO.

Mechanics' Mill, Cor. Mission and Fremont Sts., San Francisco.

ELECTRICITY.

Tunnel Lighting by Electricity.

The Batignolles tunnel, just outside the St. Lazare station of the Western Railway, in Paris, is to be lighted by electricity. It is said that it has frequently been proposed either to open up the tunnel or to light it efficiently, not only on account of the inconvenience to passengers, but also because recent events have proved that the tunnel constitutes a serious danger to the workmen upon the railway. The railway company has definitely decided to adopt the system of illumination invented by M. Brochon. Under this system 900 incandescent lamps will be disposed along the tunnel, 150 along each side of the three sections. They will be placed at a height of 15.75 feet above the rails, and each lamp will be inclosed in a strong sheet iron box, the light being thrown on the wall by means of a powerful reflector. This light will be received by plates of burnished tin, covered with glass, which will be placed at a height of 6.56 feet. These will in turn reflect a soft and agreeable light into the cars. In order to economize as much as possible, the lamps will be automatically lighted by the train, and only that part of the two walls directly opposite to the train will be at one time illuminated. But as sudden change from bright light to darkness would constitute a danger to the trackmen, it is proposed to place 20 lamps overhead in each section of the tunnel, and these will be kept permanently lighted. It is also intended to introduce a decidedly novel feature for the benefit of the passengers. Besides a limited number of advertisements, it is said that reading matter will be provided along each side of the tunnel. By an automatic process quotations on the Bourse, the latest news telegrams, winners of horse races, and other matters of interest will be displayed, and as the train slows down before entering the tunnel it is said to be easy for the passengers to read what is displayed. The work is now being proceeded with.—Engineering News.

THE FAURE PATENT IN GERMANY.—While in this country the litigation concerning the Faure patent has resulted in tying up both companies, the Germans, like the French, have acknowledged the rights of Faure. The Supreme Court of Appeals of Leipzig has just delivered a judgment confirming the decision of the German Patent Office concerning Faure's patent, and thereby establishes its validity. It will be remembered that a year or more ago a similar decision was reached in France. As we have so few accumulators here, the litigation in this country is of comparatively little interest, except in so far as it delays the development of the accumulator. It is a matter of no great concern, therefore, who is the winner here, if winner he may be called at all, but both in Germany and France the accumulator business is very large and prosperous, increasing continually. The accumulator there is a staple, reliable article of manufacture; here it is considered, like the electrical goods of the quack doctor, fit only for the ignorant and unsuspicious. But the accumulator when substantially made is a very convenient and useful accessory to an electric plant, even though many Americans think otherwise, and it is to be regretted very much that it has such a bad reputation here. As much of this is doubtless due to the lack of healthy competition, owing to the fear of a possible fundamental patent, it is to be hoped that a definite decision will soon be reached in this country too, in order that we may begin to make up for valuable time and reputation lost in this almost endless litigation.—Electric world.

TELEGRAPHIC INVENTIONS.—New inventions in applied telegraph are so frequent that the reader cannot keep up with them, says the Chicago *Journal of Commerce*. Here is a recent English improvement whereby three messages can be transmitted on one wire—the invention of Langdon Daviess. It is called the phonophore. Time has proved the value of the system, and it has been adopted by all the important railways in the country. The most recent development is the introduction of a system by which a telephone can be used on a wire which is being simultaneously taken up by a telegraph message. This discovery has been applied recently to the Great Western Railway Company's block line between Southall and Brentford, a distance of three and a half miles, and the telephone is working so well that the faintest sounds are heard even when a telegraphic message is being sent on the same wire.

QUICK WORK.—On the occasion of the recent Oxford-Cambridge boat race on the Thames, the London papers containing the result and full details of the race were on sale within four minutes after the Oxford crew had passed the winning post. The press boat, a it steamed up the Thames, paid out a cable consisting of a seven-strand conductor, insulated with vulcanized rubber warps and with braids of flax, which had been especially manufactured for the purpose. Over this cable the progress of the boats at intervals of a few minutes along the entire course was transmitted to the papers and published all over London almost as the crews were passing the point indicated. Immediately following the result there was dispatched a complete description of the race from start to finish, which was in the hands of the newspapers and others provided with the instruments of the Exchange Telegraph Company long before a single newspaper man was able to land his "copy" from the press boat at Mortlake; and also before the pigeons dispatched from the scene were able to settle down in a homeward direction. The instruments used were Morse sounders. The short description of the race which was finally sent contained over 150 words. Another conspicuous feature of the contest was the fleet of electric launches, which was the largest ever seen on the Thames.

ENDLESS ROPE HAULAGE BY ELECTRICITY.—The Leavenworth Coal Co., at Leavenworth, Kansas, says the *Colliery Engineer*, is arranging to drive the endless rope haulage machinery at the foot of the shaft by electric motors. There are two separate lines of rope, one on each side of the shaft, and the length of each is about 3500 feet. Each line will be operated by a 40-horse power Sperry electric motor. The power is at present applied to the work by a transmission rope from the surface. As the shaft is 710 feet deep and very wet, and the ropes are exposed to the influence of frost in the winter, their average life is only about eight months, while in the mine where the ropes are dry, the haulage ropes last from 3 to 4 years. By the use of the electric motors, the heavy expense of frequent renewals of the transmission ropes is overcome.

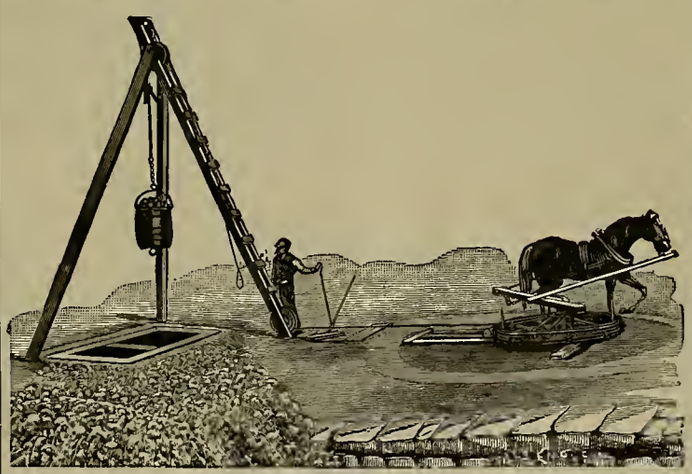
RISDON IRON WORKS PAYS THE FREIGHT.



Common Sense New Steel Whim
All Complete for $125, Freight Prepaid to any Railroad Station in California.

No cog wheels or clutches to break. Ninety per cent of this whim is wrought iron and steel, and will spring or bend instead of breaking, and besides, can be repaired at any blacksmith shop should breakage occur, thus obviating the necessity of sending away hundreds of miles sometimes and waiting a week for repairs. It can be packed anywhere a jack can go, the heaviest piece weighing 300 pounds. Total weight, 800 pounds.
It is just the whim to open up mines in isolated camps where steam power and experienced men are hard to get. With one horse 25 tons can be hoisted 300 feet on each shift. It is just as safe and reliable as an engine. Over 1800 in use, some running eight years without one dollar's expense. We make two, four and eight-horse power whims for heavy mining, also derrick whims and everything pertaining to horse power hoisting.
Buy a good whim and put more money into underground work is the way to open up a mine and make it pay.
For circulars and cuts giving full information, write to
RISDON IRON WORKS,

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR WEEK ENDING JUNE 21, 1892.

477,197.—HEAD REST—J. A. Barker, Pasadena, Cal.

477,491.—FEED WATER HEATER—Jos. Bell, Trontdale, Or.

477,495.—WINDOW SHADE FIXTURE—Geo. Biehn, Tacoma, Wash.

477,361.—CONCRETE MIXER—G. F. & H. N. Gray, S. F.

477,362.—MACHINE FOR WRAPPING BLOCK MATCHES—Grisel & Severio, S. F.

477,537.—SASH FASTENER—D. Gutermute, Petaluma, Cal.

477,547.—REIN HOLDER—C. A. Hughes, Spokane, Wash.

477,371.—SAFETY ATTACHMENT FOR ELEVATORS—L. M. Kellogg, S. F.

477,274.—TABLE—A. F. Kinzler, S. F.

477,428.—FEED ROLL—G. H. Marsh, S. F.

477,217.—POCKET PERFUME CASE—John McCoy, Pasadena, Cal.

477,308.—FAUCET—J. M. McFarland, Virginia, Nev.

477,439.—CLOTHES DRIER—J. McKinnan, Colfax, Wash.

477,331.—BAG LOCK—H. McKinnon, Eureka, Cal.

477,573.—FURNITURE CASTER—R. R. Parrish, Portland, Or.

477,387.—SAWDUST BURNER—Scott & Sheafor, Mott, Cal.

477,469.—TRANSMITTING POWER—Tarpenning & Sherwood, Turlock, Cal.

477,474.—SIGN STENCILING MACHINE—G. H. Tietjen, S. F.

477,584.—CAN-HEADING MACHINE—M. A. Wheaton, S. F.

21,645.—DESIGN FOR PIN—J. A. Bidwell, Ivanpah, Cal.

The following brief list by telegraph, for June 29, will appear more complete on receipt of mail advices:

California—James W, Atkinson, Milpitas, spring gun; August G. Dahmer, Alameda, Door hanger; Thos. J Hubbell, San Bernardino, tree prop; Andrew W. Livingston and S. E. Sterrett, San Francisco, gun; George L. Moore and C Mary, assignors to W. T. Harris, Stockton, grape picker; August Pirch, Los Angeles, reversible plow; E win H. Rose, Colton, sewer, water and drain pipe laying device; Madison J. Russell, Los Angeles, bicycle stand; Charles P. Standford, elevator latch; William P. Walling, Santa Monica, elevated track or tramway Oregon—Henry Y. Clarke, assignor to the Portland Iron Works, Portland, adjustable cut-off valve gear; Horatio F. Hicks, Ashland, ore concentrator; John H. Peterson; Portland, lath holter. Washington—John Blair, Spokane, making white pigments; Arthur J. Shaw, Spokane, means for locking and unlocking mail pouches.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible (by mail for telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

SAWDUST-BURNING AND AIR-BLAST APPARATUS.—Thos. T. Scott and J. J. Sheafor, Mott, Siskiyou Co. No. 477,387. Dated June 21, 1892. The invention relates to an apparatus for feeding sawdust, shavings and other refuse of woodworking machinery to furnaces where it can be disposed of, and a means for supplying an air-blast to said furnace; means for regulating the blast and distributing it, and also for supplying it to steam boilers, reduction, smelting and other furnaces.

MACHINE FOR WRAPPING BLOCK MATCHES.—George Grisel and Frank Severio, assignors of one-third to J. D. Case, S. F. No. 477,362. Dated June 21, 1892. This is an improvement on a former patent granted to George Grisel, the particular object of which machine is to wrap the paper around the composition ends of block matches. These are ordinary sulphur matches made in splints formed by splitting or cutting blocks of wood down to a certain distance, so that the splints all hold together by a web helow. It is usual to wrap with paper the upper or composition ends of the blocks to protect them. By this invention the wrapping of the blocks is all done by machinery.

SAFETY ATTACHMENT FOR ELEVATORS.—L. M. Kellogg, S. F. No. 477,371. Dated June 21, 1892. The invention consists essentially of a short air cylinder with an air-tight piston, connected with the hoisting mechanism of an elevator, and of valves by which the flow of air from the cylinder is regulated or arrested, so as to check or stop the downward movement of the cage in case of accident. The object is to provide a series of checks by which the downward movement of an elevator cage may be retarded or altogether arrested, either automatically or at will, these checks being operated independently of each other.

Eastern Metal Markets.

NEW YORK, June 30.—The followlng are the closing prices the past week:

	Silver in London.	Silver in New York.	Copper.	Lead.	Tin.
Thursday	40⅞	88¾	11 70	4 05	21 40
Friday	40 1-16	87⅞	11 70	4 05	21 40
Saturday	40⅛	87⅝	11 70	4 05	21 40
Monday	40¼	88	11 70	4 05	21 25
Tuesday	40 5-16	88	11 70	4 15	21 20
Wednesday	40 1-16	87¼	11 70	4 15	21 20

Pig tin is unsettled. Copper is steady but dull. Lead is firmer. Quicksilver is steady. Pig iron continues irregular.

MARKET REPORTS.

Local Markets.

SAN FRANCISCO, June 30, 1892.

General trade the past week, while only moderately fair, was fully up to the trade in the closing week in June in former years. There is no denying but that a feverish uncertainty of trade is giving place to that of buoyancy, and as each week passes, this feeling appears to gain in strength. This growing in confidence is largely promoted by several important trade factors, not the least of which are the following: A closer scrutiny of accounts has forced many weak merchants to the wall and others to limit their purchasing account and make collections so as to either cancel their indebtedness or place it in such position, when, by carrying the account, the wholesale merchant is comparatively safe. Large farms and tracts of waste lands are being cut up and marketed in small farms, and the last purchasers buying for homes, bring to their aid in the cultivation of the farms, all the modern improvements (scientific and otherwise) in the method of farming. No idle men, unless by choice, are to be found, while farmhands are receiving better pay than ever before. Railroad construction, both in the extension of main lines and the building of feeders, is being vigorously pushed. Railroad building invariably brings in its wake many improvements; small towns are being built up and farming land better cultivated. All these naturally create more business to manufacturers, and with all else being equal, our iron workers should, and probably do get the bulk of orders in their line. The high cost of raw material on this coast (about everything used has to pay duty or else high freight while at the East manufacturers have home supplies and low freights) is a serious drawback, yet it is, to a great extent, successfully combatted by superior work and a better knowledge of this coast's requirements.

The local money market continues easy. The semiannual settlements and the drawing in of considerable outlying funds have not had any visible effect on the market. The heavy disbursement which is to be made in next month (July) will soon find its way back into the general financial reservoir, when more funds will be added to the already oversupply. It is claimed that unless grain makes a sharp advance in price, large sums of money will be required by farmers, for they will prefer storing rather than to sell at around present market prices.

New York mail advices are still confirmatory of a sluggish oversupplied money market, but the consensus of opinion of the better informed financiers and also writers on financial topics, is that everything is pointing in the direction of a general revival in speculative and other securities. This position appears to be grounded on the following well substantiated facts and statistics.

From 1885 to 1888-89 there was a steady and constantly increasing expansion of credits, overbuilding of railroads and other constructions—in short a general exploiting of capital in every enterprise and in every country; more particularly in this country and in the South American States. In 1889 the unsound speculations and unwarranted enterprises began to collapse, and, though the Argentine-Baring panic did not come until the last half of 1890, there were premonitory symptoms of some impending crisis as early as the end of 1889, when the prices of iron began to decline, owing to the cessation of the demand. During nearly the whole of 1890 Europe was a heavy seller of American securities, because European finances were demoralized by the Argentine collapse, the Baring suspension, the embarassment of Portuguese and Spanish finances, the collapse of the Panama Canal project and other similar events. Europe wanted money, and sold American securities because they were almost the only thing that were salable. But for the last six months Europe has been full of idle money accumulated by these sales, and has only continued to sell Americans because speculative capital there was waiting for American capital to take the initiative in the recovery and speculative "boom" which was expected as the natural reaction from the long depression. With the prospect of fair crops this year, the contrast with 1888, when everything was ripe for the collapse of speculation, is very great. Instead of the market being gorged with new railroad bonds, as it was in 1888-9, there are now comparatively few new issues in the market. Railroad capitalization increases every year with the growth of the country, but instead of being increased $700,000,000, as it was in 1888, a moderate estimate for 1892 would be between $300,000,000 and $350,000,000. While there is this diminished output of securities, there has been an immense accumulation of wealth which will seek investment in interest-paying securities. As instances of this in this country, the deposits in the savings banks of the United States in June, 1891, were $1,623,029,749, against $1,364,196,550 in 1888, an increase of $258,833,199, and at the present date this increase has probably reached near $350,000,000. The deposits in the national banks of the United States in March, 1892, were $1,702,365,953, as compared with $1,409,000,000 in October, 1888, an increase of nearly $300,000,000. Since 1888 also, there has been an increase of over $200,000,000 of currency in circulation in the United States. All these are conditions which inoicate increasing wealth and warrant the expectation of higher prices for all sorts of interest and dividend paying investments.

SILVER—The market during the month of June fluctuated at strong prices. On the first day of the month the London market was quoted at 40⅝d per ounce, standard; by the seventh it had advanced, under buying for India, to 41⅛d, then, with a falling off in the demand from that source, the market shaded off, but, with increased Indian buying, the price on the 15th was 41d. After this date there was a steady decline up to the 24th, on which date the price was 40 1-16d. On the 25th it began to strengthen again. The market in this country and also the foreign markets are very sensitive and quickly response to any demand. It is claimed that on to-morrow a vote will be taken in the Senate on Stewart's silver bill, which, it is thought, will be favorable. The bill will go to the House for immediate action. If this should prove to be the case, then there is no doubt but the bill will be passed, for a Democratic House would hardly dare defeat more favorable legislation on silver. The coming international bimetallic convention is receiving an unusual degree of attention by financial and commercial journals abroad. The large majority appear favorable to the object sought. There was shipped the past week from this port to Japan $45,200 in silver bars.

MEXICAN DOLLARS—Exports the past week aggregate as follows: To Hong Kong $142,477, to Japan, $201,000. Total, $343,477. The market is fairly steady at 70½@71 cts.

QUICKSILVER—Receipts the past week aggregate 191 flasks. The market is steady at $44 per flask in lots less than 50 flasks and $43 50 in lots for 50 flasks and upward. The usual concessions are allowed on export lots.

BORAX—Recelpts aggregate 230 ctls. The market is fairly firm, but quiet.

LIME—Receipts aggregate 3,486 bbls. The market continues weak with a good demand ruling. Six thousand sacks of lime were sold the past week for Hawaiian Islands; tho shipment to be made from the source of supply.

PIG LEAD—Our market is essy at quotations. The East reports more offering which caused lower prices, but at the close the tone is stronger with fewer sellers in the market.

TIN—Pig is fairly steady at quotations. The demand is slow. More plate is being used than has been, which causes a steadier tone English cables report more business in plate for American account. New York mail advices report that market at a standstill for pig, pending liquidation between New York and London. It looks as if this is only temporary.

PIG IRON—The market is steady with a free consumption reported. There are few supplies on the way while low prices for American are against holders. It looks as if the latter will, to a considerable extent, supplant foreign. *Iron Age*, June 23, reports the New York market as follows: "The Southern furnaces have succeeded in placing a good deal of tonnage, by lowering prices to the lowest notch yet reached. Heavy sales are reported from Chicago, Cincinnati and Louisville. Gray Forge having been sold down to $8 50, Birmingham. Large sales are reported in Pittsburg of Bessemer Pig for forward delivery at practically the lowest prices reached. It is reported that the last decline is due to lower sales of ore at Cleveland, thus reducing the cost of production of the pig iron. This is confirmed to some extent by the fact that steel billets are being offered for August and forward delivery at prices as low as any made in the past.

COPPER—The market has retained a steady tone. It looks as if the international agreement was in part to keep the market from fluctuating to too low figures so as to net a loss, or of going too high so as to restrict consumption.

COAL—Imports the past week aggregate as follows: Newcastle, N. S. W., 5276; Seattle, 729; Nanaimo, 2800; Tacoma, 4000; total 12,805 tons. The consumption of steam is steadily enlarging and as there is no great increase in coal tonnage on the way, many dealers look for better prices this fall.

Mining Share Market.

SAN FRANCISCO, June 30, 1892.

The market was dull and heavy, with slightly lower quotations, up to Tuesday, when a steadier tone set in, which was followed on yesterday by slightly higher prices. The action of the market looks very much as if the mill rings and stock pools have come to the conclusion that any further depression might cause them to lose more shares than they could oy any possibility secure. There are quite a number of old-time miners and their friends who feel confident that in several of the mines on the Comstock there is more rich ore than the inside wish the public to believe. In acting on this conviction they have been and are still holders of shares in these mines, on which they pay regular assessments, with a heroism deserving of a better cause than to aid the rings to loot the mines. Miners now working in the Comstock mines unhesitatingly affirm that the lode is rathholed from one end to the other by drifts, crossdrifts, crosscuts, winzes and shafts, which make it possible to take ore from one mine and credit it to another It is this knowledge which makes them chary in operating on the bull side of the share market on reports of ore in any particular mine, for they firmly believe that it will not do outsiders any good, as it will be taken out, milled and the bullion credited to other mines, the shares of which and the method of mining and milling of ore are not so closely watched. They think that in this way much of the ore has disappeared. Even admitting this to be correct, yet we unhesitatingly affirm that in two or more mines there are important bodies of ore which should be shown up and dividends be paid. Why is it not done? This rooting around the grass roots or working on extreme upper levels will not do, although it is calculated to throw outside shareholders off the track. It seems to be about time to make a more pronounced move looking to the extraction of the ore and giving credit to the mine or mines to which it rightly belongs.

The history of the Comstock lode is prolific with secrets, which when brought to light will cause more surprise to the street than did any revelation in the suit against the Nevada Bank directors. It will tend to prove that the old saying that dead men cannot tell tales does not hold good so far as Comstock mining is concerned.

Immediately following Judge Hebbard's decision in the Hale & Norcross suit, a reported friend of H. M. Levy, told the writer in the presence of two persons, that the decision would amount to nothing as it would be appealed and on such weak points that the Supreme Court of this State would reverse the decision and send the case back for retrial. It was said that everything would "go by the board" or else only a very small judgment be secured. The person even affirmed that a majority of the judges of the Supreme Court might, if such a thing were possible, be influenced in defendant's favor. It is to be honed that the speaker was in error, yet who can tell?

From information at hand it looks as if in 1893 a new era will set in on the Comstock lode, but whether it will be for mine-looting or honest management by which shareholders will be benefited, is, as yet, an open question. The long contention about the Sutro tunnel appears to have been settled at last; experiments have been made with Comstock ore, which show that the most refractory and also the low grade can be mined and milled at a profit; electricity as a motor power will be used at the mouth of the Comstock (formerly called Sutro) tunnel and the ore brought from the mines through the tunnel to mills which are to be built at or near the mouth of the tunnel. By sending the ore through the tunnel, a large saving will be made in extracting ore, less he paid for transportation and less paid for milling, particularly with electricity used for motor power.

DIVIDEND NOTICE.

The German Savings and Loan Society,

526 California Street.

FOR THE HALF YEAR ENDING JUNE 30, 1892, A dividend has been declared at the rate of five and one-tenth (5 1-10) per cent. per annum on Term Deposits, and four and one-quarter (4¼) per cent. per annum on Ordinary Deposits, payable on and after FRIDAY, July 1, 1892. GEO. TOURNY, Secretary.

DIVIDEND NOTICE.

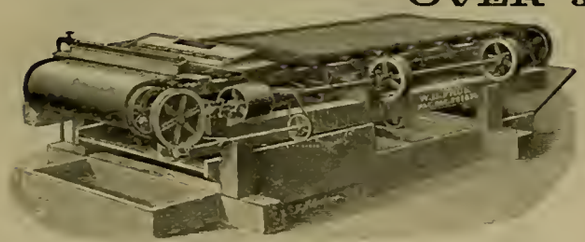
OFFICE OF THE PACIFIC COAST BORAX COMpany. San Francisco, June 30, 1892. At a meeting of the Board of Directors of the above-named Company, held this day, a Dividend (No. 19) of One Dollar ($1.00) per share was declared, payable MONDAY, July 11, 1892, at the office of the company, No. 101 Sansome Street, Room 26. Transfer books will close July 5, 1892, at 3 o'clock, P. M.

ALTON H. CLOUGH, Secretary.

FRUE ORE CONCENTRATOR

OVER 3200 IN ACTUAL USE.

Manufactured under Patents of April 27, 1880; September 18, 1883; July 24, 1888; and March 31, 1891.



GLADSTONE MINING COMPANY, C. J. Clark, M. E. Gen'l. Supt. FRENCH GULCH, Calaveras Co., Cal., Dec. 12, 1891.

MESSRS. ADAMS & CARTER, San Francisco, Cal.—DEAR SIRS: During my experience in mining and milling, I have used twenty-four of your four-foot Frue Vanners on different kinds of ore, both gold and silver. I have made competitive tests against them with other widely puffed-up concentrators and have always found the FRUE in first place. When I built this mill (20 stamps), I determined to put in six-foot Frues in order to save space and machinery. I am now running four of your six-foot machines and they have been going for TWELVE MONTHS. They are taking the pulp from 20 stamps, crushing a minimum of fifty tons per day, and do better work than the four-foot tables. They require no more attention than a four-foot table and handle at least twice the quantity of ore. I have run them up to 80 tons per day and could not see that they were crowded. They stop and start as easily as the smaller tables and have the advantage of double capacity with the same bearings and wearing parts, requiring no more oil, and no more wear and tear than the smaller tables. My repair account for the past six months has been too small to mention. In order to give an idea of the work they are doing here I will state that the ore has varied monthly from $5 to $20 per ton and the tailings from nothing to 60 cts. per ton. I will conclude by saying that I cannot endorse the six foot Frue Vanner too highly, and it is the only table that I would have in my mill.

C. J. CLARK, Gen'l Supt.

Price of 4-foot wide Plain Belt Frue Vanner..... $550, f. o. b.
" " " Improved Belt Frue Vanner ..... 800, f. o. b.

"TRIUMPH" ORE CONCENTRATOR WITH IMPROVED RIFFLED BELT.

(PATENTED.)

The competitive trials which have been held between the "Trimph" Ore Concentrators, the "Frue" Vanners and other forms of concentrating devices, do not warrant the assertion that the "Frue" Vanner is the best ore concentrator in the market. The fact that the "Frues" have improved (corrugated) belts does not militate against the superiority of the "Triumphs;" for, when desired, they (the "Triumphs") can be mounted with a superior belt known as the "Blasdel" Riffled.

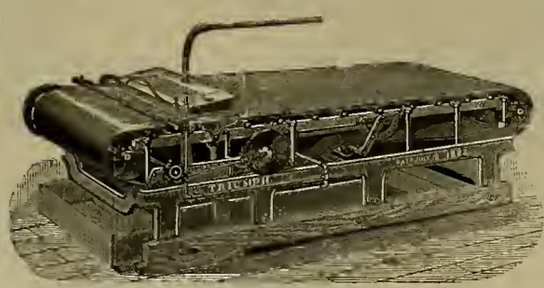
—o—

Price "Triumph" Concentrators, with Improved (Patented) Belt - - - $650 f. o. b.
Price "Triumph" Concentrators, with Plain Belt - - - - - - - $550 f. o. b.

—o—

We are prepared to guarantee the superiority of the "Triumph" over the "Frue" or any other form of Concentrator, for coin if used here.

Circulars and testimonial letters furnished on application.



JOSHUA HENDY MACHINE WORKS,

39 to 51 Fremont Street, San Francisco, Cal.

Both the "Trimph" Concentrator and "Blasdel" (riffled) Belt are protected by incontestable letters patent, granted by the Government of the United States.

Location of Works, Grass Valley, Nevada Co., Cal.

GRASS VALLEY, NEVADA CO., CAL., NOV. 10, 1885.

Joshua Hendy Machine Works, 39 to 51 Fremont St., S. F., Cal.:

GENTLEMEN—I am pleased to state, in reference to the "Triumph" Ore Concentrators, that four (4) of them were placed in the mill of the Original Empire Mill and Mining Company in April, 1884, and a thorough test made of their practical operation; and their efficiency having been demonstrated, four (4) more were subsequently introduced as the complement of the Twenty (20) Stamp Mill, and the eight (8) have been and are now running with entirely satisfactory results.

At the Ten (10) Stamp Mill of the North Star Mining Company, under my supervision, four (4) are also in successful operation, and from my observation of their practical workings, I am convinced that this form of Concentrators is the equal, if not superior to any other style of Vanners or concentrating devices. DAVID MCKAY, JR.,

Signed] Sup't North Star and Original Empire Mining Co.

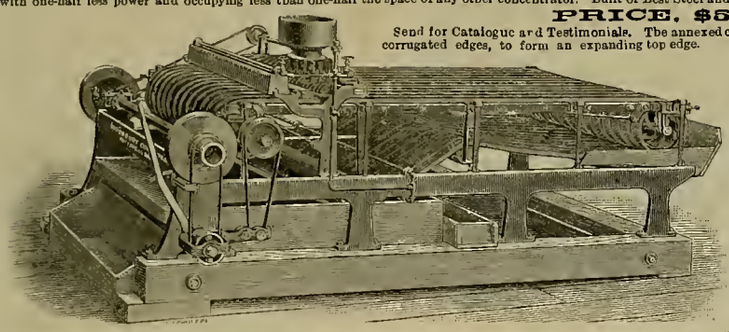
N. B. When the stamping capacity of the two above named mills was increased, more "Triumph" Concentrators were purchased, and twenty-eight (28) are now in constant successful operation.

THE WOODBURY ORE CONCENTRATOR WITH IMPROVED BELTS

Was awarded the Highest (Bronze Medal) Premium at Mechanics' Institute, 1890 and 1891. MORE THAN DOUBLE THE CAPACITY with one-half less power and occupying less than one-half the space of any other concentrator. Built of Best Steel and Wrought Iron. Strong and Durable.

PRICE, $575, f. o. b.

Send for Catalogue and Testimonials. The annexed cut shows the belt in its improved form, which consists of corrugated edges, to form an expanding top edge.



THE SAN JACINTO ESTATE—Office of the General Manager. OJALCO, Oct. 30 1891.

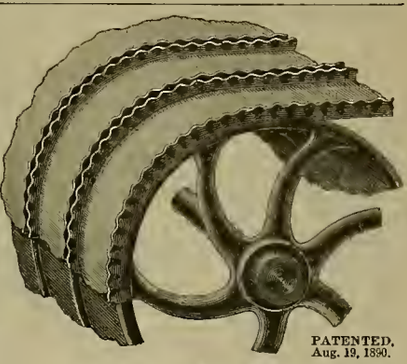
GEO. E. WOODBURY, ESQ.—Dear Sir: In reply to yours of the 27th inst., respecting the working and efficiency of the "Woodbury" Concentrator placed in our works by you, I am pleased to inform you that it is giving entire satisfaction; it has a much greater capacity than any other machine, and is doing fully one-third more work, with the concentrates equally clean, as from either of the machines at work here

[Copy] Yours faithfully, S. HARRIS, Manager.

THE SAN JACINTO ESTATE, LIMITED—Office of General Representative, P. O. address, South Riverside, San Bernardino County.

OJALCO, February 17th, 1892.

GEO. E. WOODBURY:—Your letter of inquiry about your concentrator came to hand in due course. Your machine is doing well, the motion is all right, and the machine is giving entire satisfaction. Yours faithfully, S. HARRIS.



PATENTED, Aug. 19, 1890.

GEO. E. WOODBURY, Man'f'r, 213 to 219 First St., San Francisco.

PLACER AMALGAMATORS

Combined with Steam Shovel or Dredge.

BUCYRUS SYSTEM.

NEW METHOD OF PLACER MINING.

Saves all the Gold. Uses very little Water. Treats large quantities at Low Cost.

—BUILT SOLELY BY THE—

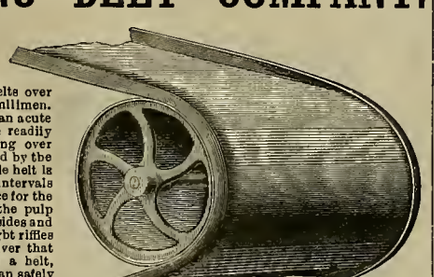
BUCYRUS STEAM SHOVEL AND DREDGE COMPANY,

BUCYRUS, OHIO, U. S. A.

THE BLASDEL CONCENTRATING BELT COMPANY.

We have now made arrangements to have our new Improved Concentrating Belt manufactured in San Francisco. We keep always on hand Belts suitable for the Triumph and Frue machines, but can make any length or width desired. The advantages of these belts over *any others* will be readily seen by practical millmen.

First, the flanges or edges of our belt stand at an acute angle inclining toward the center, and therefore readily conform to the change of direction while passing over the end rollers; thus the vexation and loss caused by the frequent breaking of the flanges of the old style belt is practically done away with. Again, our belts, at intervals of two to four feet, have a very slight riffled surface for the space of three inches, which tends to equalize the pulp on the belt, and prevents it from banking on the sides and forming channels through the center. These slight riffles also save very fine sulphurets and the quicksilver that could otherwise escape with the tailings from a belt, the surface of which is entirely smooth. We can safely say that it is a better belt than has ever been manufactured for use on this coast. It will last much longer and will handle fully one-third more pulp than any smooth belt, and will save a higher percentage of sulphurets



H. G. BLASDEL, Jr., Manager, 419 California St., San Francisco

A New Method of Placer Mining — The "Bucyrus" Amalgamator.

The new method of placer mining, using the Bucyrus patent amalgamator, is the result of much practical study and experiment. It claims to include all the best features of value found in any system of amalgamation. For a long time the Bucyrus Steam Shovel and Dredge Company, Bucyrus, Ohio, sole manufacturers, have been maturing the system and perfecting the plant in actual operation, and believe they have now established its success beyond question, and are willing to guarantee that it will save even to the finest particle of gold.

The "Bucyrus" patent amalgamator consists of a strong wrought iron tank, lined with amalgam plates. In one end of the tank is mounted a revolving cylinder 78 inches in diameter, having openings in each end through which material is received and discharged. This cylinder is formed by a double screen, with an annular space between them, the inner screen being of a heavy steel plate with coarse holes punched in it, and the outer screen being of fine wire cloth. Of the material dumped into the cylinder, the stones and coarse gravel are retained by the inner screen and ejected by the revolving bucket in the discharge end of the cylinder. The finer gravel is retained by the second screen, after passing through the first, and also ejected, while the sand and gold particles sift through both screens into the tank. The arrangement of screen cylinders and internal helix for conveying the material is shown in Figs. 3 and 4. It will be seen that about one-third of the cylinder, being the part containing the material, is submerged in the tank, and that, therefore, the material is subjected to the most thorough washing and tumbling during its passage through the cylinder.

The length of the internal helix is 72 feet; each particle of gravel is tumbled over that length of coarse screen, during washing. Similarly, the finer material is tumbled over 120 feet of screen in the outer helix, thus securing more perfect washing and screening than could be accomplished in any other way in a similar space. The construction of the helix and ejecting buckets is the subject of special improvement, whereby great discharging capacity is secured, and also great strength to withstand the charging of large quantities of material. Amalgamators, as heretofore made, have only been adapted to receive such material as could be fed them by hand or wheelbarrow. The charge of one ton, twice a minute (this being the capacity of the steam shovel intended to be used with the "Bucyrus" amalgamator), is a very different thing and calls for different treatment, and a construction that is solid enough to withstand continuous service under such conditions.

The gold-bearing sand and gravel, after passing through the screens into the tanks, tends to settle to the bottom, under the cylinder. It is prevented from doing so by jets of water issuing from small inclined nozzles in the bottom of the tank, which maintain the sand and gold in suspension, and which are so directed as to cast it repeatedly over the amalgam plates, with which the tank is lined. Every particle is in this way brought a great number of times in direct contact with the plates, so that none of the gold has a chance to escape. The same jets are so directed as to have the effect of working the sand toward the rear end of the tank, from whence it escapes as tailings, through a suitable valve.

The pressure of water required for these jets is about 20 pounds per square inch, and the quantity about 600 gallons per minute. By suitable arrangement to drain off the tailings the same water can be used over and over again, only enough of a supply being necessary to make good the losses by seepage and evaporation. The pumps to furnish the pressure can be located at any convenient point.

The long experience of the Bucyrus Steam Shovel and Dredge Company, as designers and builders of dredging and excavating machinery enables them to produce an excavator or steam shovel that is specially adapted for use in connection with the amalgamator just described, and powerful enough to deal with large quantities of material and to withstand continuous rough and heavy service.

SECTIONAL VIEWS OF "BUCYRUS" AMALGAMATOR.

At Sutro.—Representatives of a New York electric company are at Sutro, looking over the ground and estimating the cost of constructing an electric plant on the Carson river and running the mill at Sutro on ore to be conveyed from the Comstock mines through the Sutro tunnel. While it has not been definitely settled to erect a mill at Sutro, the president of the tunnel company, Theodore Sutro, has been on the ground the past two weeks, making calculations and figuring on the possibilities of such an enterprise. It would mean the instillation of new life into the Comstock mines, the greater prosperity of the Sutro tunnel, and renewed activity at the little town of Sutro

---

John D. Sagemiller died in this city on Friday, June 24th. He arrived in this city from Seattle on June 8th, and was on his way to Carlsbad. A week ago he was taken ill, and the physician called to attend him said that it was impossible to save his life. Mr. Sagemiller had extensive and very valuable mining interests in Alaska, where for years during the summer months he made his home. In 1870 he was the first man to build a house in Juneau, where he made his headquarters and enjoyed the distinction of being one of the first of the white pioneers. He was also fortunate enough to buy considerable land in Seattle before the boom, and to realize big profits from his investments.

Guatemala Mines.—Private correspondence from Guatemala, under date of June 16, states that the Santiago mill is soon to be stopped pending the prosecution of explorations in the Rosario mine at Mataquescuintla, owned by Messrs. Cabarrus & Co. The Rosario is the only silver mine that has been worked to any great extent in Guatemala in recent years. For the past year the mill has been under the supervision of Mr. Julius Partz, formerly of Partzwick in Mono county.

The Mexican Mining Law.

On page 29, under the heading of "New Tax on Mines," is given the provisions of the mining law now in force in Mexico. It is a radical change from previous conditions. A federal tax guaranteeing absolute ownership of mines is created. On each *pertenencia* (a square of 100 meters to the side described on a horizontal plane without reference to the inequalities of the ground), they charge a tax of $10 for the title deed. After the 1st of July, a tax of $10 per annum is to be paid on every *pertenencia* or fraction thereof of which a mining property consists. This annual tax is to be paid in advance in triennial installments. The tax is doubled should there be any misstatements or concealments as to the area of the mining property. Failure to pay the annual tax in the first month of the period specified is punished by a fine, and at the expiration of the third month the right to the mine lapses, and the property is forfeited.

There is something definite in this new law. A man pays so much for his title, getting it at once. To maintain the title he must make annual payment in installments. If he does not pay he loses his mine. There is no keeping up the mining title by annual expenditure, such as we have, but the money is paid the Government. There is one thing certain about such a proposition. The mines will be kept actively at work. They cannot be left idle for years or relocated from year to year, as with us. A man who keeps an idle mine must pay for the privilege, and few people will care to do this. Our own system in this country is defective in many respects, and we are not as progressive in this direction as the Mexicans. Our code of mining laws was originally founded on theirs, and what we have called improvements on it are, to say the least, doubtful. Their aim appears to be to keep the mining properties active, and we have tried to do the same thing. This new system of Mexico will excel ours for this purpose, though the annual tax is paid to the Government with them instead of being spent on the mine, as with us.

Yuba County Quartz.

We met this week Mr. R. H. Daly, the architect of this city, who has recently returned from the old town of Timbuctoo, Yuba county where he has relocated under the name of the Boa, the old Bull Head quartz mine. Nothing has been done on the claim for 30 years, yet there are fine facilities for working the claim and the rock is rich. This ledge averages in size from three to six feet in width, and holds its own as far down as they have gone. A quartz mill of 20 stamps capacity is to be erected, and its motive power will be run by water pressure and a Pelton wheel.

James Galvin is the superintendent, and he has great faith in the mine; believes it will be very profitable and do much to bring out other undeveloped claims near Smartsville. Mr. Daly has shown us the certificates of assays made by Prof. Hanks, which show that the samples of rock submitted for test ran $72.34 in gold and $9 82 in silver, a total of $82.16 per ton. The rock carries four per cent sulphurets valued at $1485.78 per ton. This is pretty good rock to be lying out of doors with no one to take it up.

Mr. Daly was for many years connected with mining affairs. He was one of the original locators of what afterward became the Raymond & Ely Claim, and was also one of the first prospectors of the Boise basin, Idaho. He is pleased to find in a pleasant part of the state so fine a claim as the one relocated. With modern implements of mining and approved appliances the mine can pay now whereas it could not at the time it was orginally worked. He and Daniel Kennedy run the Boa Mine and are now at work developing it.

Hope for Silver.

The passage of the Silver bill by the Senate came in the nature of a surprise last week for although the silver men have been hard at work, they had almost given up hope of accomplishing anything this session. The bill must now go to the Coinage Committee of the House, of which seven members out of the twelve are said to be favorable. The Democratic House can hardly afford to refuse to pass the bill and the matter will then come to the President and rest in his hands. What he will do remains to be seen. He is not an advocate of free silver but doubtless he will argue if the representatives of the people have passed the bill it will be well for him to sign it. As a matter of political expediency he may feel compelled to do it.

It has been a matter of regret that the silver measure became a political issue; but as the matter stands now it seems fortunate after all. In trying to shift the responsibility from one party to the other both will have to pass the bill.

As far as the mining communities of this coast are concerned, the passage of a free coinage bill will make a wonderful difference. This State is not so directly interested since we only produce about a million dollars worth of silver a year. But Nevada and other States have felt the depreciation of the metal sorely, and their mining interests are languishing in consequence. With free silver, mines, mills and furnaces will start up in all directions, giving employment to thousands of men now idle. The miners are naturally most anxious for the measure to pass, and the attendant industries in the silver-producing States will at once experience a revival, which will make good times in all these communities.

Royalty Charges on Processes.

The company which owns the MacArthur-Forrest cyanide process in this country charges too much royalty for its use. If it is to be applied to low-grade ores there will be a decided limit to the number of mines of this class using it. The question of relative economy should be better considered. If people are working ore as many are, which only yields $3 or $4 a ton at a present cost for mining and milling of 50 cents to $1 per ton, they can not pay $1 per ton royalty to use this process and $1.50 per ton for cost of process. It is a low estimate of cost to put the expense of working the cyanide process at $1.50 per ton without the royalty; and where people have already methods as cheap as those in use in California, the low-grade quartz men will let the new system severely alone.

In fact it is the universal judgment which has been confirmed by experience, that the principle of royalty is a wrong one as applied to industrial processes. It has been tried in a thousand instances and failed, beginning with the Whitney cotton-gin process and traced through the history of inventions. Of course a fair living profit should be charged on the process and the others left to reap the reward. Counting up the number of tons worked and charging on each is wrong in principle. At any rate, if the charges are to be made in that way, there should be some discrimination in the matter of the value of the ore worked. Ore worth $100 a ton could easily pay the $1 per ton royalty while it would be prohibitory on $5 rock. It would be better to graduate the charges in some way so as to make it fairer than the present plan.

THE drawing of the cyanide process plant published in the PRESS of last week, sketched by Mr. Paul, was not intended to represent either of the mills under his charge in Shasta county, but was merely his suggestion for the arrangement of a small cyanide process plant.

The Labor Troubles in Pennsylvania.

The attention of the whole country has been attracted to the labor troubles at the Carnegie Works near Pittsburg by reason of the great interests involved and the bloodshed which has resulted. On Wednesday there was a conflict between the Pinkerton detective force and the men at the Homestead Works in which 21 men were killed and 50 wounded. Burning oil, dynamite, rifles and cannon were used in the effort to keep the Pinkerton men out of the works. Some 4000 employees resisted the advent of these men and it was during this resistance that the fatal fighting took place. The Pinkerton men finally surrendered and were badly maltreated by the mob when they came ashore from the barges which had brought them to the bank of the river near the works. Workmen from other mills came to the assistance of those at the Homestead plant and the men from the whole iron-working region thereabouts are intensely excited.

The trouble has been brewing for a month or so past. The Carnegie company submitted a scale which was to govern the workmen in the steel plants and announced that it was their ultimatum. The scale made sweeping reductions in the wages of skilled men, and it was officially announced that unless the terms were complied with before July 1st the places of the workmen would be filled by others.

This was followed by a peremptory refusal by the company to recognize the Amalgamated Association. The men announced their determination to resist any effort on the part of Carnegie to run the plant with nonunion men. Trouble was precipitated by the workmen at Homestead hanging H. C. Frick, President of the company in effigy, and in retaliation the company ordered an immediate shut down of the big works. The employees at once proceeded to orgauize for the defensive and the company erected a high board fence around the entire works, giving them the appearance of an immense stockade, the sides being pierced with port holes. Then when the Pinkerton men came to go inside the fence to protect the works the conflict began in which men were killed.

The occurrence was a most unfortunate one indeed. It may, however, be of benefit in the end in one direction and that the abolition of the band of hired mercenaries known as the Pinkerton men. When occasion arises to protect industrial works from the attacks of men, the police and sheriffs should be called upon; if they cannot suppress a mob, the militia or even regular troops would be available should circumstances demand it.

These men would not have fired on militia as they did on people hired for money to carry out the ideas of the owners, and peaceable possession of the works would have been obtained. But they were angered at the presence of these mercenaries, and in the end behaved outrageously to them upon surrender.

THE SAN FRANCISCO DELEGATES to the Mining Congress at Helena met in Nevada Block on Wednesday, present, Attorney-General Hart, Louis Janin, State Mineralogist Irelan, W. S. Keyes, Charles G. Yale (of the MINING AND SCIENTIFIC PRESS), W. S. Lyle and T. S. Church. It was decided to adopt the unit rule for the delegation and those unable to attend left their proxies with Mr. Hart. This city is entitled to 31 delegates. Judge Niles Sealres, of Nevada County, who was President at the last session of the congress, leaves for Helena Saturday with the San Francisco delegation.

THE beet sugar industry in this State is growing in importance. This year the three sugar factories, one each at Chino, San Bernardino county, Alvarado, Alameda county, and Watsonville, Santa Cruz county, will be run to their full limit of production. Over 450 men will be employed in and about them in making the sugar. Their combined capacity is about 318,000 pounds per day, and it is estimated that 37,000,000 pounds of sugar will be turned out during the three months they will be in operation before the beet crop is used up.

A PROMINENT Nevada silver man says: "We are all for silver in Nye and Lander. The mines are all closed down and we know what caused it. Party lines are wiped out, and we no longer know any party. We are ready to fall in line under the banner of silver. If the old parties do not give us what we want we will vote solidly for the third party that puts up a silver candidate. We may not elect our candidate, but we will show the Eastern politicians that our talk is not idle talk, and that we mean to keep this fight up until recognized."

DOWN in Los Angeles county they are studying up the matter of utilizing the water of the San Gabriel river for mechanical purposes. Surveys for the location of the dynamos at the mouth of the canyon have been made, and negotiations for the right of way over land up the canyon carried on. It looks now as if this matter is assuming a practical shape.

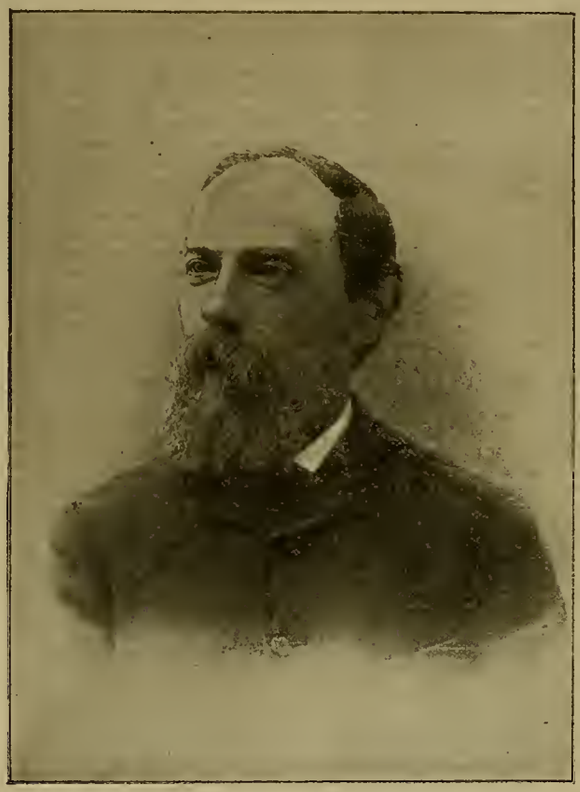
The Professor of Agriculture at the State University.

After nearly 18 years of unremitting service, the Regents of the State University granted Professor Hilgard one year's leave of absence for rest and foreign travel, and last week he and his family took their departure. In his absence, we bring to the attention of our readers certain phases of his life and work, which are not perhaps widely known here, and which, in the progress of his active labors among us, it did not seem so fitting to recall. It is not our intention to allude at length to the facts best known to Californians; to his coming here at a time when the relations between the agriculturists and the university were somewhat strained, because, perhaps, of mutual misunderstandings, and of his signal success in winning for the university new interest and favor, by his personal acceptability, by his earnest and honest zeal in the agricultural interest, and by the exceptional originality and ability which characterized his work. Nor is it necessary to enlarge upon his success in building up the agricultural department of the State University, and in undertaking agricultural experiment station work so early that California can claim priority in efforts which are now progressing in all the States and Territories. These facts are known to most of our readers, as are also the extent and variety of his agricultural researches, which have furnished a basis for many industries and a motive force in others. It is rather the personal history of the man and the features of his work which have attracted widest attention abroad, as well as in California, that we shall endeavor to present.

Eugene W. Hilgard was born in Zweibrucken, Rhenish Bavaria, on January 5, 1833, of distinguished parents. His father becoming dissatisfied with the Government, resigned the chief justiceship of the court of appeals and emigrated to America, settling on a farm near Belleville, Ills., where Eugene had a thorough schooling in all the details of agriculture, and where he received a superior education from his father. When 16 years old he went to Europe, and studied at Heidelberg, Zurich, and at the Academy of Mines at Freiberg, in Saxony, taking the degree of Ph.D. at Heidelberg, in 1853, at the age of 20. After two years in Spain and Portugal, he returned to America, in 1855, to take charge of the chemical laboratory of the Smithsonian Institution, and lectured on chemistry at the National Medical College. In 1858 he was appointed chief geologist to Mississippi, having, however, been connected with the geological survey of that State for some years previous. As State geologist his work was vigorously pushed forward, and in 1860 was printed his report on the Geology and Agriculture of Mississippi, though not actually published until after the war. No other State report contains so much original matter, presented in such a clear and orderly manner, as this. Up to the time of the publication of this report, the whole subject of the cretaceous and tertiary of the Gulf States and of their soils was, with the exception of the information contained in the two reports of Tuomey in Alabama, practically in darkness. In the light of Prof. Hilgard's Mississippi report, the study of the cretaceous and tertiary formations of the other Gulf States becomes a comparatively easy task.

In 1860 Prof. Hilgard made a second trip to Spain and married at Madrid, the daughter of Manuel Bello of the Spanish army. During the war Prof. Hilgard was mainly assigned to the duty of preserving the collections of the University of Mississippi at Oxford, continuing also the office work of the survey, so far as his connection with the Confederate "Niter Bureau" permitted. He took a prominent part in scientific matters connected with the Confederate army, and at the close of the war resigned as State geologist to become professor of chemistry in the University of Mississippi. His interest in geology did not cease upon becoming professor of chemistry, and many of his most important contributions to the science of geology were made during the period from 1865 to 1873. We need mention only his papers on the Quaternary Formation of the Gulf Region, his Geological Reconnoissance of Louisiana, his articles on the Mississippi River and its Delta and Mudlumps, and his Geological History of the Gulf of Mexico, all of which are authorities on the subjects of which they treat.

In the Mississippi report, the soils of the State are for the first time adequately treated and this, the beginning of a long line of study and investigation of the chemical and physical properties of soils, continued up to the present time and still in progress. Some of the results of these investigations have been published from time to time, such as Soil Analyses and their Utility, Objects and Interpretation of Soil Analyses, Silt Analyses of Mississippi Soils, On the Flocculation of Particles, etc. These titles will show the position of the author in regard especially to the utility of the chemical analysis of soils, first taken in his Mississippi report, has been consistently maintained through all these years. When the Mississippi report was published, with the exception of Dr. Peter of Kentucky, Prof. Hilgard was about the only scientific man in the United States who held that it was possible to form any reliable estimate of the fertility of a soil from its chemical analysis. In the works above quoted, and particularly in the great work done by him for the tenth census, on Cotton Culture in the United States, the author has demonstrated that the chemical and physical analysis of our virgin soils, properly interpreted, together with accurate observations of the timber growth, and other characters of these soils, in their natural condition, furnish the data from which it is perfectly feasible to ascertain both their agricultural value and their proper treatment in cultivation. Hence, Prof. Hilgard is a warm advocate of agricultural surveys, for the benefit of farmers, and is constantly urging the general government to give proper attention to the bearings of geology upon agriculture, and the study of the soils in their natural conditions, while it is still possible to do so.



PROF. E. W. HILGARD OF THE STATE UNIVERSITY.

One of the results of this long and laborious series of investigations has been to carry conviction to the minds of a number of the scientific men of the country, and at the present time Prof. Hilgard has a strong support both in this country and in Europe, where his work is well known, and as much appreciated there as it is here.

An ingenious worker and expert glass blower, he constructed, himself, much of the apparatus needed by him in his lectures and in his soils investigations. His apparatus for the mechanical analysis of soils is the best of its kind and appears to have overcome the difficulties which previously made such analyses of comparatively little value. It is largely used in Germany, where that class of careful and thorough-going investigation is more frequently carried on than here.

While Prof. Hilgard was in charge of the chemical department of the University of Mississippi, laboratory work was first introduced as part of the course of instruction in chemistry. This course, though for a long time entirely optional, was taken by a number of students, some of whom have since risen to distinction, and have spread the teachings of Hilgard into other States.

In 1873 Prof. Hilgard accepted the chair of geology and natural history in the University of Michigan; but the climate proving too severe for his health, he accepted the professorship of agricultural chemistry in the University of California; and in the spring of 1875, moved with his family to Berkeley, Cal., where he has since resided.

In geology, Hilgard is a close and accurate observer, and the sagacity with which he interpreted all the facts coming under his observation, and appreciated their bearings upon the geological history of the Gulf region, can be understood only by one who has himself studied the same territory.

One of Prof. Hilgard's most important works was his report on the cotton production of the United States, made for the tenth census, in which undertaking he was given full latitude. With the aid of the State geologists and other qualified men of the cotton States, his report embraces not only the results and discussions of the census returns, but also descriptions of the physical and agricultural features of each of the 15 States concerned. These volumes exemplify the plan according to which he would have the whole country described for the benefit of the agricultural population.

Prof. Hilgard has been a frequent contributor to the scientific and agricultural press. As may be inferred, he is a man of the people as well as of science, and is an indefatigable worker. His writings are characterized by great force, and clearness of expression, and sprightliness of style that make them all pleasant reading. In conversation he is bright, animated and sympathetic.

Prof. Hilgard is a member of the National Academy of Sciences and of other scientific bodies. He has three times received the degree of LL. D., first by the University of Mississippi, next from Columbia College on the occasion of the celebration of the centennial anniversary of that institution, in 1887, and subsequently, in the same year, the same honor was conferred upon him by the University of Michigan, at the celebration of its semicentenoial anniversary.

Among the Nevada Miners.

A gentleman who returned this week from a month's trip among some of the Nevada mining camps, says that the greatest interest is being manifested among the miners concerning the cyanide process. In some camps where the percentage gained from the ore is smaller than it should be they are having hard times, and look upon this method of working ores as a great blessing. Miners all about are experimenting with the solution in a small way and are anxious for fuller information. The special edition of the MINING AND SCIENTIFIC PRESS devoted to consideratioo of the cyanide process has been looked for with great interest, as everywhere the miners were anxious for detailed information and records of experience. The interest manifested is only second to that concerning the silver bill in Congress. There was great disappointment at the action of the convention of the two great parties in the "milk-and-water" silver planks and the miners were despondent. Many of the camps are dull and the men idle, where if the free silver coinage prevailed all would be bustle and activity. Our informant said it was painful to see such a number of miners and prospectors discouraged and so many plants idle. Yet the mineral wealth of Nevada is very great, and the whole region ought to be more prosperous. But with idle mines and men, and a doubt as to value of the product of even those mines working, the prospects are certainly not good.

THE extensive production of bricks manufactured of coal dust and pitch in France may be judged from the amount stated to have been used in that country in 1889, namely, 24,000,000 tons. The coal dust is for this purpose most thoroughly mixed, in a certain proportion, with melted pitch, and then pressed into shape and afterward dried. Leaving out the cost of the dust and pitch, the bricks cost from 30 to 50 cents per ton to manufacture; the pitch is in value 30 cents per ton of bricks, and the coal about $2 per ton, carrying up the figures to some $2.70 per ton.

THE CATSKILL GRAVEL-MINING CO., near Bangor, made another cleanup recently of $1600, and was shut down 36 hours to repair engine. This company is composed of Marysville men. A. W. White, E. E. Meek, Wm. Kline, Will Greely and John Pender are the largest owners. They have only prospect machinery now, but within 90 days will have the largest mill on the Blue lead. Every one says it is the richest gravel mine known. The last yield was $20 to the ton.

EASTERN NEVADA is said to be coming to the front in mining matters. It is expected that work will commence on a number of properties this summer. A railroad from Salt Lake westward is all that is needed to make that part of the State boom.

The Mines of Calaveras County.

From our Traveling Correspondent.

Part I.

TO THE EDITOR.—The mother lode crosses Calaveras from Rohinson's Ferry on the south to Mokelumne Hill on the north in a talc slate belt. The principal mines of the county are those on the mother lode. Northeast of the mother lode is a mineralized zone, filled with innumerable small mineralized veins in the common black slate, that has never been operated to any extent. Still farther northeast a different character of mines is found, as is shown in the old Calaveras, "Right Bower"—Washington mines, where ores carry a large percentage of galena and are very high in their grade. Beyond this is a free-milling belt that has been the most extensively developed in the Sheep Ranch mine. Still farther north, the country rock changes to granite, and at West Point is found a grade of what might he called base ores that are higher in their uniform values than the ores of any other portion of the county.

Southeast of the mother lode the country rock changes to a serpentine, and in this belt is found the copper mines which are extensively operated at Copperopolis. Running parallel with this belt and on its west side there is a belt of gold-bearing quartz ledges which are developed the most extensively in the Pine Log.

GRAVEL.

Almost every gulch and stream bed paid handsomely in placer gold in the past history of the county. These old sources of wealth have long since been exhausted, but there still remains practically untouched, old river channels that by some ancient upheaval have been left sitting on the mountain tops with a covering of lava. In a few instances these old channels have heen worked to a limited extent, and the gravel found proved rich. The county still contains an almost unlimited extent of these same covered channels, the richest of which, thus far prospected, is the Blue lead extending from O'Neil's creek just west of Sheep Ranch and thence via. R. R. flat to West Point. That is the most inviting field for capital desiring to invest in drift gravel mines. As a description of all of the mines in the county would not prove of interest to the general reader, I shall confine my article to those mines which give evidence of being worked to a profit.

ROBINSON'S FERRY.

Beginning at the river bank at Rohinson's Ferry, and extending past Carson and almost to Angels, 8000 feet on the mother lode, the Calaveras Gold Mining Company, Limited, with Mr. J. H. Weston as general manager, is operating. This is an English corporation with a capital of £110,000. Tbe property is developed by a fine tunnel driven in from the south end of the property on the vein 1200 feet, showing a vein 25 feet wide in the face of the tunnel, which is here 350 feet deep There is an operating shaft sunk 365 feet near the center of the property. At this point a 20-stamp water-power mill, with an electric plant for light and pumping has been erected. The average value of the ore is difficult to determine. Tbere does not seem to be any continuous shoot, but the pay makes and breaks in hunches, very much like the old Gwin mine. Many of these ore bodies are very extensive and their value high. It is not possible, or rather not profitable, to seggregate this ore, and in consequence the entire vein is milled, which gives an average milling value of $5 a ton in free gold and 2½ per cent of sulphurets nf $67 a ton value. The quartz crushes easily, the mill averaging 2½ tons to the stamp. When the property is sufficiently developed to employ all of the stamps that the great extent and width of vein is capable of supplying this will be one of the most extensive mines in the State.

It is to Carson that we all turn when we want to bnast of the value of America's gold mines.

THE MORGAN.

Messrs. Irving & Fair, owners. This famous mine remains idle through the owners "agreeing to disagree." The mine is situated on the mother lode at the point of junction of the east and west branches. At this point or "crossing," as pocket miners would call it, was found the richest ore shoot of gold-bearing quartz in America's, if not in the world's mining history. From a block of quartz, six hy eight feet, over $3,000,000 was extracted. One piece of solid gold 108 pounds in weight, was cut off of the mass, and carries the medal to-day as the largest single piece of gold mined in America. Mr. Irving states that the gold was all connected and ran in seams about an inch thick, and that if it had been thought wortb while, the whole $3,000,000 could have been separated from the quartz as one piece of gold. Hereafter, when other sections boast of their nuggets, recollect that the Morgan of Calaveras Co. had ore of $3,0000,000. This mine has a large mill, and if the owners could in any way reconcile other differences, the mine would be a large gold producer.

THE MELONES.

This mine adjoins the Morgan. In the past, the mine was simply worked in the belt of mineralized talc, which accompanies the mother lode. In the Melones this talc was on the footwall, while on the adjoining mine, the Morgan, it is on the hanging-wall. On the Melones the talc hed was about 100 feet wide on the surface and tapered to a wedge at 250 feet. The average value of the talc was said to have heen $3 a ton. The vein proper was not worked nor developed, and the mine was closed down when this talc gouge was exhausted. Recently, the mill has been sold and removed to the Doc Jones mine.

THE CARSON CREEK MINE.

E. W. Roberts is superintendent of this mine, which is better known as the Doc Jones Mine. In the past history of the mine the property was regarded as a silver proposition, but it was not possible to make it pay as such. Recently, the mine has changed hands, and under Mr. Roberts' charge is being equipped with the former Melones mill, of 40 stamps. The mine is opened by shaft to a depth of 190 feet on a vein which runs from 15 to 20 feet in width of gold and silver-bearing ore. The vein runs from $5 to $15 in free gold and carries 3% of sulphurets of an assay value of $300 to $400 a ton. In excavating for the mill site a large vein has been uncovered which has been crosscut 40 feet. This vein is a fine serpentine slate intermingled with quartz, resembling in appearance the chloritic slate of the Father De Smet mine of Dakota. The crosscut on the vein has not reached the wall, but as depth is obtained the vein increases in mineral. A sample of the vein from this crosscut gave $8 a ton in free gold. This new discovery is 250 feet southeast of the old Doc Jones vein and bids fair to excel in value the original vein.

Leaving Carson and vicinity on the south, there is nothing in operation at this time until Angels is reached.

ANGELS.

At this point Messrs. Hayward, Hobart (deceased) and Lane have secured possession of the greater part of the mining ground and have taken hold in a way that assured a big success from the start. Their combined plant at this point is one of the largest and best equipped of any in the State. They not only own the mines, hut the water system of the county is theirs, as is also the large chlorination works of Angels. Everything that experience, ability and money can do to facilitate and cheapen the working of the mines and at the same time save the greatest per cent of the ores' value has been done. No necessary expense has been too great. The natural result is that although tbe ores are low in value, under their system of management they all pay.

THE UTICA.

This may be called the parent mine, as it was the first property taken hold of by Messrs. Hayward, Hobart and Lane. Mr. C. D. Lane is in cbarge of this and their other mines at this point, as general manager, while his snn, T. T. Lane, is foreman of the mine. On this property, two vertical shafts have been put down. The north shaft is 530 feet and the south 850 feet deep. From these shafts crosscuts have been run and drifts extended and connected at each 100 feet down to the 500-foot level. The vein runs from 15 to 35 feet in width, and is what is known locally as "a slate vein," being largely composed of mineralized talc slate intermingled with small seams of quartz. The vein is one of a number that at this point lie to the east of the mother lode and resemble feeders in small veins, with this difference, that at Angels the feeders, if they can be so called, equal or exceed the mother vein in size and value.

The plant on the mine is complete and very extensive. The mill is a model of its kind, with its 60 stamps crushing 200 tons a day, while the adjoining blacksmith, machine, electro-plating, sawmill, framing and air compressor shafts make a complete mine plant, with the system of concentrating and chlorinating added. The ores are hoisted in 15-ton skips to the top of the gallows frame. The quartz is here crushed and taken by car from the bin to the mill. The mill is in charge of Mr. Hayward's old and reliable millman, Mr. Jno. E. Reaves, under whose milling the quartz gives up everything that can be saved by the most modern system of milling free gold ores. The quartz when crushed flows over the usual amalgamating plates, then over Frues, and the tailings are conducted by a flume a half mile down the gulch to a canvas plant 85x100 feet, where all the finer mineral, that escapes from the Frues, is caught. A survey has been made to a point nn the cnmpany's ditch above Murphys, where some 300 feet nf pressure can be obtained. At this point it is intended to erect an electric plant which will furnish power for all of the company's mines at Angels and light the towns and mines as well The beauty of this scheme is that there is no waste of water, as the same stream will flow on to Angels, as it does now, and in the same ditches. At present the Utica and the company's other mines are nperated by water power secured by their ditch, the old Union ditch. Water is conyeyed by ditch about 35 miles, and tben by pipe two miles to the mines, and 400 feet of pressure secured. The 60-stamp mill and its plant requires about 300 inches a day. With electric power, the only water needed will be that of the batteries, or one inch to each battery, 12 inches in all, as against 300 now. Mining operators contemplating the erection of an extensive plant will find a visit to the Utica both pleasant and profitable.

At the Utica, the Fullen safeties and ore and water skips have been adopted, and have filled a long-felt want. I will describe these under the head of The Altaville Iron Works, where they are manufactured.

THE STICKLE.

This mine adjoins the Utica on the southeast, and is owned and operated by Messrs. Hayward, Hobart's Estate and Lane, with Mr. T. Lee as foreman. The shaft is now down 600 feet, a new gallows frame has just been erected, and a more powerful hoist is on the ground. As soon as this is in place, the shaft will be put down to 800 feet and connected with the south shaft of the Utica. Tbe company have recently purchased the Ilex mill, formerly near Mokelumne Hill, and are now adding its 40 stamps to the 20 of the Stickle, thus giving it 60.

THE MADISON.

T. Lane is superintendent of this property. It is about a half mile west of the Utica, and is on the center mother lode vein. In the past, a drift was run on the vein from the surface. The mine was bonded to Messrs. Hayward, Hobart and Lane, who erected a hoist and put down a very fine shaft. At 100 feet the vein was crosscut and showed 20 feet of heavily mineralized quartz. The shaft was then driven down to 200 feet and a crosscut run, which showed the vein somewhat broken up at this point. It is the company's intention to sink to 500 feet. In the past working of the mine, the richest shoot was found about 300 feet north of this shaft. Drifts are now being run to it from the levels. The mine has a 20-stamp mill. That this will prove a good property is already shown.

THE GOLD CLIFF.

Woodson Garrard is superintendent of the Gold Cliff, which adjoins the Madison on the north, and with some half dozen other mines on this vein is under bond to Messrs. Hayward, Hobart & Lane, though operated at this time by Messrs. Garrard and partners. In the Gold Cliff tbe ore is quarried out. The opening looks like a small valley with perpendicular walls of talc slate, filled with stringers of quartz. Several companies failed to work this property tn a profit until it fell into Mr. Garrard's hands. He soon got the cost of mining and milling down to 55 to 65 cents a ton, with his 20-stamp mill, and if he had 120 instead—which the immense size of the vein would supply—could lessen that one-half. At this point on the mother lode the vein holds no large bodies of quartz. An occasional six-inch stringer is about the largest quartz vein. Mr. Garrard has been wnrking into the foot wall, and finds it all mineralized. The opening looks to be 300 feet in width at this time. If Messrs. Hayward, Hobart & Lane once take hold of the Gold Cliff, and give it 120 stamps, tbe property will crowd the Dalmatia on its reputation of 42 cents a ton for mining and milling.

Beyond the Gold Cliff as you go north is the Hickle & Bennet and Lindsey; both said to be under bond to Messrs. H. H. & L. Still further north is

THE SUFFOLK,

Charles D. Smythe superintendent. This property contains three veins nf the mother lode. The center vein has a shaft down 80 feet, and levels run. The ore here proved to be much higher in grade than farther south on the vein. The sulphurets are richer and carry several metals in combination. The mine has a dry barrel amalgamating mill, which is said to have worked the ore up to 95 per cent of its assay value. Owing to the death of two of the principal owners, the mine has been closed down and is for sale at its cash value.

THE EXCELSIOR.

This vein is midway between the Utica and the Gold Cliff and is better known as the Johnnie Meyers Mine. The property is now heing developed under bond by Chas. Lillie, the old foreman of the Utica mine. The vein is opened by numerous cuts and shafts along the surface. It is Mr. Lillie's intention to sink on it "to where she lives," as the ore is very heavily mineralized at water level and the sulphurets go as high as $2000 a ton. There is no doubt about its proving a mine, and if it is, Mr. Lillie is the man to make it talk. Luck to Charlie!

THE EL DORADO.

This mine adjoins the Excelsior on the north and is the property nf J. Fisher. The mine is idle at this time.

ANGELS QUARTZ MINING CO.

This mine, G. H. Fox, Supt., is the property of our next Democratic Governor, Mr. Coleman. The mine is in the north of Angels and extends to Altaville. Its side lines take in a number of veins. A large amount of development work has been done on this property and the extent of the ore body is very great, but low in grade. It is thought that Mr. Coleman will erect, this season, a large mill so as to handle the property to a good profit.

THE ECLIPSE

Mine is about a mile west of Angels, and is in charge of Mr. J. M. Davis.

The property is now being developed and is opened by shaft to a depth of 110 feet. The mine has a Huntington mill. If the owners will follow the example of Messrs. Hayward and Hobart and Lane and put their shaft down to 500 feet then drive their levels and then if the mine warrants it, erect a mill, they may expect the same success to attend tbeir operations that accompanies those of H. H. & L.

THE GOLD HILL.

S. V. Ryland is president and general manager. This is the old "Osborne mine" and is just west of the Eclipse, famous in times past for her pockets. It was the amounts extracted from these rich pockets (over $100,000) near the surface, that led Mr. Ryland to purchase, as he did not believe that the gold, though found in, came out of the grass roots. The company have drifted in 700 feet, made an uprise to the surface and are now breasting out each way 30 feet with new walls reached. The vein matter is a ferruginous talc slate, with innumerable quartz crossings—which are due to the fact that in the center of this mine two large veins cross each other at almost right angles. It is Mr. Ryland's intention to sink 200 feet, unless stopped by the gold. The mine has a 10-stamp mill of 900 lbs each and crushes 40 tons a day at a cost of 57 cents a ton for mining and milling, which can be very materially lowered by the addition of 50 stamps, which the mine will soon supply.

ANGELS CHLORINATION WORKS.

Tbis plant is the property of Messrs. Hayward, Hobart and Lane and is in charge of Mr. T. M. Smith. There are two furnaces. One of 11x80 feet, and another of 12x80 feet, with a capacity of 4½ tons each, every 24 hours or 8¼ tons for the plant. At this plant a very high per cent of the assay value of the sulphurets treated is extracted. Both furnaces are kept in constant operation from the mines of the section. Tbe charges here, as elsewhere through the State, are $20 a tnn and 10 per cent off for loss.

ALTAVILLE.

Altaville is now so closely joined to Angels that it may be called a part of the same. The most famous mine of this place is the Cherokee, B. R. Priree, proprietor. The mine is southwest of Altaville about a mile. From this mine there was extracted in coarse gold over $700,000, without sinking 75 feet. The prnperty has been worked by spells for years past. About six months ago Captain Little bonded the mine, pumped it out, examined it, and announced that he would put her down 500 feet and see where all that gold came from. Once this is done the Cherokee will prove a good strip.

ALTAVILLE IRON WORKS.

Demorest & Fullen are the proprietors. These works have recently been enlarged to accommodate the fast

growing trade, and the well known mechanic, Mr. T. Fullen, taken into partnership. In addition to their general work of casting, turning, constructing and repairing, the company now manufacture Mr. Fullen's patents, the chief of which is

THE FULLEN MINING SAFETY.

Your readers will recollect that a cable parted at the drum on the Utica mine and nine unfortunate miners lost their lives in consequence. Following that accident every inventor of a mining brake came forward with his patent. Those which seemed to possess merit were closely examined and the best of them tested, but they were all found wanting. As a rule they depended on the cables parting between the nre skip and the sheave. If the cable parted between the sheave and the drum, as was the case in the Utica, the weight and consequent friction of that part or end of cable would prevent the brake from acting until the the cable had passed over the sheave. This would allow the skip to attain a velocity which could not be held in check by any brake. Either the guides would be torn out or the brake wrecked. At this time Mr. Fullen, who was the master mechanic of the Utica Co., took the matter in hand and soon had in successful operation the Fullen safety. The manager, Mr. C. D. Lane, tested the brake repeatedly and found it to hold the skip if the cable was but slacked. To test the matter beyond all doubt a rope cable was attached to the wire cable, the skip given a 15-ton load and the hoist started. When the skip had attained its customary speed the rope cable was cut squarely off and the skip did not drop 18 inches before it was held solid. So well pleased is the Utica Co. that they now have four in use, two more ordered, and will add two additional safeties for the Madison mine.

The safety works equally well in both vertical and incline shafts. The principle is that of a parachute. The increase of speed caused by breaking of cable or giving way of machinery causes the wings to rise and the dogs to grasp the guides. In this way the action is entirely independent of the cable and invariably positive. This safety is a great advance in the safe working of all deep mines and will be hailed with joy by both miner and mine operator.

Perhaps the best feature of the brake, and one that is found on no other, is the simple arrangement by which the miner on the hoist can at any point stop the skip independent of the engineer; this has already proved itself of great value on the Utica. Mr. Lane, by some mistake, was lowered into the 30 foot sump. He caught the lever and stopped the skip when the water was up to his shoulders. Without this feature nf the skip he would undoubtedly have been drowned. As it was, he barely escaped death from an after attack of pleura-pneumonia. At another time the brake on the hoist failed to act, and the miners on the skip realizing that something was wrong, stopped the skip. If the safety had no other merits, the fact that with it the skip can be instantly and uniformly stopped at any point in the shaft, by the miners on the cage or skip, is sufficient in itself to bring the safety into general use wherever mining is followed by shaft.

In addition to the safety, the Work's manufacture a water skip, ore skip and water screen. The water screen delivers its water through a side valve, by means of which the water is discharged without dumping the skip, thus saving all wear. As the skip discharges automatically, it need not be stopped at an exact point, and in consequence there is no danger of upsetting the skip. Then, too, it can be used to let its water out through any lower tunnel, as it is not necessary for the engineer to see or know its exact location. The ore skip discharges its ore the length of the car from the shaft, making it impossible for any of the ore to fall into the shaft. The water screen is a revolving screened drum which is stationary as long as the water passing through it is clear, but the least obstruction will cause the drum to revolve, and thus clear the drum. Inventors like Mr. Fullen have the mining field open to them, and nowhere will their efforts be as speedily and liberally acknowledged. I will send you some further notes on this county next week.

E. H. SCHAEFFLE.

A Theory of Illumination.

OAKLAND, June 30, 1892.

TO THE EDITOR.—Development of the theory of light has made considerable progress of late years and its true nature correctly defined; but, according to my views of the subject, scientists are still somewhat off the track as regards certain minor points, such as the illumination of opaque bodies. A beautiful analogy exists between the phenomena of sound and light. It is universally understood that both are results of the same great force—motion. Motion in the atmosphere and motion in that mysterious fluid, ether, appeals to our senses, the former to our ears, the latter to our eyes, producing the effects we call sound and light.

Now, ether is that subtle fluid filling all space, permeating all matter, the media of light-waves whereby light and heat are transmitted from the sun to our earth. There is an intense agitation and commotion of particles continually going on in the sun, and these impulses transmitted to the surrounding ether are carried on and out in ever lengthening lines until some of them strike our interfering atmosphere and we have the phenomenon of light.

Darkness, you say, is due to the absence of light, and light, we have just seen is atomic vibration; hence, darkness must be comparative passivity. Go to your room at night when all is dark and you see nothing whatever, for the composing atoms of each object in that room are in comparative rest. But now light the gas; immediately vibration is set a-going by the combustion, and passing on it agitates the atoms of every object present. You now look at matter made visible not by reflected rays, as commonly supposed, but by light-waves of their own creation, caused by the imparted energy. A luminous body is the source of etheric light-waves, while an opaque substance is made visible by the presence of a luminous one.

Light is as much more subtle than sound, as ether is than air, and the general truths of the one apply to the other, and vice versa; hence, in tracing the analogy we discover a beautiful correspondence between sympathetic *sound* vibration and light illumination, which we at once see is nothing more than sympathetic *light* vibration. The rays of the sun reach the side of the moon visible to us, creating among the atoms of that body, a violent agitation. When they strike, their office is fulfilled, their motion has been checked and they cease to be. But now the commotion of the moon's particles imparts its energy to the surrounding ether and thence to us, giving us the delightful evenings of full moon. Give credit where credit is due, give the honors to the moon and stop heaping them upon her big brother, sun. She vibrates in sympathy with his vibration, the analogy here being perfect—stop the source of the sound and there would be no sympathetic vibration from a neighboring instrument; refuse the moon the presence of the sun and she would ever remain invisible.

In the particles of most matter composing opaque bodies, sympathetic vibration ceases the moment the luminous one is removed, the atoms returning to their original comparative passivity. Some substances, however, are exceptions, such as the sulphides of calcium, strontium, etc., which retain, for a short time, the imparted energy. It is to these substances we attach the name, phosphorescent.

This somewhat meager outline of light propagation may be profitably extended in all the various phenomena of light with interesting results. We are not yet at the end of the tether of discovery, many startling facts await our persevering efforts.

L. T. M.

The San Francisco Meeting of the Mechanical Engineers.

The degree of success attending the recent meeting of the American Society of Mechanical Engineers, at San Francisco, may be estimated in various ways, says the *American Machinist*.

If it were to be considered solely upon the basis of attendance of members it could not of course be counted a very highly successful convention, for out of a membership of over 1400, less than 50 members actually attended, which seems like a very small attendance, though when compared with the usual attendance of about 100, it does not seem so small.

But we do not think the success of the meeting should be estimated upon that basis alone, for there are other things to be considered. The society is not a local one; it is not the Eastern or the Central or the Southern Society of Mechanical Engineers, but the American Society, in which all mechanical engineers in the country, no matter whether located in Maine, Texas or California, are supposed, and, in fact, invited to take an interest, and become members.

Now, having a membership scattered all over the country, and hoping to draw a still larger membership from all parts, the question arises how best to serve their interests in regard to the place of holding meetings.

If it were a matter simply of minimizing travel to and from the conventions, the place of holding them would be determined something as the "center of population" is determined from the census returns, and the meetings would then all be held, say at Pittsburg, or at Baltimore, or possibly New York.

But it is morally certain that such an arrangement would not suit the majority of members so well as the present arrangement, nor would it be so fair to the membership at large, for it would entirely relieve some of them of the necessity of traveling to and from the meetings, while others would invariably have to travel thousands of miles to attend, and all of them would see the very same city or section of country each time, without the opportunity for studying the engineering of the country generally, which the present plan affords, and which is so beneficial to an engineer.

It is observed that a meeting held in a section of country previously unvisited always results in a considerable accession of membership from that section. It is quite certain that San Francisco will be no exception to this rule, and that some valuable names will be added to the roll as a result of the meeting there—names of men who can, and probably will, by professional papers or otherwise, give to other members of the society much that will be of great value to them.

Of course it cannot be that meetings will be held as often in remote places as nearer the industrial centers, where the bulk of the membership is found, but there can be no question but that the entire territory from which members have been, and are to be drawn, should be covered by the meetings, the fall meetings—always held in New York—being a fair concession apparently to the minimum travel theory, and this made fair only by the fact that most engineers want to—and, in fact, must—visit New York occasionally, because it is the engineering as well as the commercial center.

It will probably be many years before the society will again go so far as the Pacific coast, but, if it should go again, it is probable that improvements could be suggested in the itinerary; it seeming rather strange that a body of engineers should pass through or very near to such places as Denver, Pueblo and Virginia City without visiting them. The failure to see these places must be attributed to the fact that the schedule was arranged almost solely by excursion agents, who are in the habit of arranging them for the ordinary tourist wishing to see only the regular wonders mentioned in guide books. Such a new schedule would almost inevitably involve more time, however, for it is safe to say that no feature of the recent trip would be willingly sacrificed—certainly not by the advice of those who were members of the recent party.

If it should so happen that a meeting should be held at, say Denver, within a year or two, many points of great interest to engineers, which were missed on the recent trip, could be visited, it being understood that next spring's meeting is to be at Chicago.

Most of the members of the society are, of course, busy men, and find it impossible to take the time necessary for such extended trips as the recent one, but such trips do not occur often, and there are, we think, many excellent reasons for taking them occasionally.

New Tax on Mines.

A plan for a new tax on mines has been submitted to Congress by the Department of Finance in connection with the new mining law which was outlined in these columns in our issue of April 30th last, and which, with unimportant modifications, has already received the sanction of the Legislature. By payment of the new tax, mine owners will enjoy absolute and undisturbed possession of their properties, free from the annoyance of "denouncements" and from the tiresome, and often expensive, administrative formalities necessary to obtain an "amparo," or temporary exemption from "denouncements."

In substance the bill is as follows:

Art. 1. A federal tax, guaranteeing the absolute ownership of mines, is created. The tax in question consists of two parts, one being payable on the title-deed once for all, and the other, annually, with respect to each claim or pertenencia (defioed by the Law on Mines to be a square of 100 meters to the side, described on a horizontal plane without reference to the inequalities of the ground) which the property contains.

Fractions of a pertenencia exceeding one-half are to pay the entire tax, and those less than one-half nothing at all.

Art. 2. Every mine-owner is bound before October 31st next to present his title deed to properly authorized representatives of the Department of Finance, in order that stamps to the amount of the tax may be affixed to such title-deed, and, at the same time, to declare the number of pertenencias comprised in his property.

The title-deeds which the Department of Encouragement is to issue, according to the new Mining Law, are to bear stamps furnished by the concessionaire, according to the number of pertenencias covered by the grant.

Art. 3. The denomination of the stamps in question is to be $10 and they are to be attached to title-deeds at the rate of one stamp per pertenencia.

On titles issued up to 30th June next the stamps are to be cancelled by the Department of Finance; on those issued subsequently, by the Department of Encouragement.

Art. 4. After July next a tax of $10 per annum is to be paid on every pertenencia, or fraction thereof as explained in Art. 1, of which a mining property consists.

This tax is to be irrespective of the nature of the substance extracted from the mine.

The holders of special zone concessions are to enjoy exemption from the title tax and the annual tax, but only while their concessions remain in force. The present zone grants will not be renewed at their expiration, and the mines which they cover will then come under the general provisions of the new law.

Art. 5. The annual tax is to be paid in advance in triennial installments. Mine owners are required to appear in the Federal Revenue Offices, hereafter to be designated, to pay the taxes for which they are liable, in the first month of each triennial period, without need of notification.

Art. 6. For each period of two months which the presentation of the title-deed is delayed after the expiration of the time allowed by Art. 2, a fine equal to the amount of the stamps required to be affixed to such title-deed shall be imposed.

Concealment or misstatements as to the number of pertenencias shall be punished by the imposition of double taxes, i. e. of double the amount of the original title tax and of double the annual tax for the entire period for which the regular amount should have been paid. These penalties do not relieve the defaulter from criminal or civil liability in the case.

Failure to pay the annual tax in the first month of each triennial period will be punished by a fine equal to 50 per cent of said tax, if payment be made in the second month, and by a fine equal to the tax itself if payment be made in the third month. At the expiration of the third month the right to the mine lapses, and an announcement to that effect will be published in the *Diario Oficial*, so that other parties may make application for the forfeited property.

Art. 7. Parties selling mines must notify the proper authority of the change of ownership. Deeds of sale must bear the stamps required by the Ley del Timbre (stamp law.)

Art. 8. Parties desiring to give up the operation of a mine or mines must notify the Department of Finance, when their taxes will be assessed and collected up to the date of such notification.

STOCKBROKERS' SEATS.—The Mayor and Supervisors, acting as a Board of Equalization, have been considering the request of the San Francisco Stock Exchange Board to have the seats of its members assessed at $50 each instead of $2500, which was the figure arbitrarily given by the assessor. Attorney Ackerman, for the Exchange, argued that the taxable value of the seats should be merely the difference between the pro rata shares of the realty owned by the Exchange and the selling value of the seats in the market. The realty was assessed at a rate which made the shares worth $2700 each. The value of the seats, as fixed by recent sales, was only $2500 each, and there was therefore nothing to tax. George T. Marye, Jr., stockbroker, was willing to have his seat assessed at $50, although he considered the position taken by the attorney the sound one. Jacob Greenebaum coincided.

Amador County Miners' Association.

The fourth monthly meeting of the Amador county miners' association was held on recently in Jackson. Owing to the fact that no notice had been given of the meeting, there was but a small attendance.

The president, J. F. Parks, took the chair and called the meeting to order. John R. Tregloan spoke in reference to the effort made to get a rock-breaker for Amador county, with the object of effecting an improvement in the roads of the county. The mining industry was greatly interested in securing good roads. The prosperity of the county depended in a great measure upon this matter; he therefore moved the following resolution:

That this association indorses the proposition before the board of supervisors to purchase a rock-breaker by the county, for the purpose of furnishing broken rock for the repair of the public roads, and urges the board to adopt said proposition at the earliest possible moment. Carried.

James Meehan stated that the reason why so few from Jackson were present was because it was not generally known. Had the meeting been properly advertised there would have been a good turnout.

Mr. Tregloan said he understood that at the first meeting of the association a resolution was passed giving all the printing to the paper in Sutter Creek. Such action was not proper, and he thought the resolution ought to be rescinded.

R. Webb said that he was informed the day after the first meeting, by one who was present at the organization, that a resolution of this kind was adopted for the reason that the *Record* was the only paper represented. As far as the financial effect was concerned he cared nothing, but he did think the action was an uncalled-for slap at the old-established papers of the county, and so long as it remained upon the minutes as the expressed voice of the organization he could do nothing to further its interests.

The chairman said the motion referred to was made in the hurry of adjournment, and after a motion to adjourn had been carried. It was clearly out of order, and although put and carried, it was looked upon more as a joke than anything else.

The secretary, A. B. Call, said the resolution had no place in the official minutes, and the association was not bound by it.

A recess of ten minutes was taken, during which several names were added to the membership, bringing up the total to 261.

The committee on a code of mine signals was granted one month's further time to report.

It was decided to hold the next meeting in Jackson, on Thursday, July 21st, at 7:30 P. M., to which date the meeting adjourned.

The hour was changed to the evening so that the miners might attend. A large attendance is looked for, and the objects and advantages of the association will be explained.—Amador Ledger.

Mining Congress.

Railroad rates to the Mining Congress which convenes in Helena, July 12th, have been definitely settled. There was a disagreement in the Trans-Missouri Association, and the Executive Committee of the Congress commissioned its secretary, B. Brown, to go East and endeavor to adjust the same, which mission has been successfully accomplished, as appears from the following special from Mr. Brown to the *Journal:*

CHICAGO, June 10.—Advisory board of the Western Association, on appeal, has to-day overruled Trans-Missouri Association, and one fare for round trip for the National Mining Congress is now firmly established. BARNARD BROWN.

This favorable action on the part of the railroad assures a large attendance to the Congress, which will prove the leading feature in this season of conventions in Helena.

SOUTHERN LINCOLN.—About six miles from the mouth of the Vegas wash, some very promising mines have been struck. The Red Rover mine, owned by J. B. Wilson, McClannahan and H. Wiser, is a very promising prospect. The croppings are traceable 4500 feet, showing a ledge for that distance which will average eight feet in width, and in some places the croppings stand up 75 feet in height. Assay was made of the croppings which went, silver $6.70, gold $7.50 and 33 per cent lead. A shaft 50 feet deep has been sunk on this ledge which greatly improved as depth was attained, and a fine body of ore is now exposed at the bottom. The Wilson and Blue Bell claims, situated close by the Red Rover, promise to be good ore producers in the near future, the ore going about 70 per cent lead and carrying gold and silver in paying quantities.—Pioche Record.

Machine for Sizing Ties.

Tie making is an important part of the work of saw mills in Oregon and Washington. The work of sizing ties has always been a laborious task to mill-men heretofore, but now a machine has been invented to do this work, which is being used at the West Shore Mills at Astoria, in getting out ties for the Portland and Astoria Railroad.

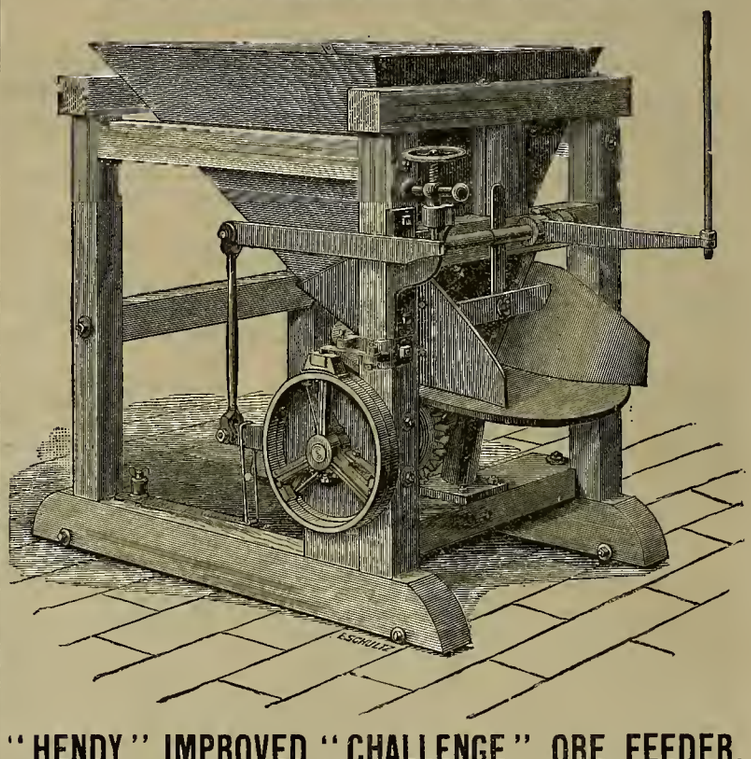
Speaking of this invention, the *Astorian* says that the ties are 8x7 inches, and ten feet long. When placed in position for tracklaying, these ties rest on six 8-inch stringers running lengthwise with the track. It is necessary that all should be of the same height from stringer to upper surface of the tie, and also should have a firm hold on the stringer This necessitates the cutting of six 8-inch slots in the tie of different depths, according to the variation in the diameter of the timber. Formerly this work was done on a planer, one slot at a time being cut, which, aside from consuming a great deal of time, was also very expensive. To obviate this, and turn out ties more rapidly, Mr. J. C. Trullinger has built a machine which does the work perfectly, and with rapidity. A carriage mounted on four 6 inch wheels, with flanges, riding on two ∧ iron tracks, is worked back and forth at will by means of a ratchet and gear underneath, connected with a crank at the side the operator stands. Suspended from the floor beams overhead by massive timbers is a two-inch shaft, running in the journals of four heavy cast-iron hangers. On this shaft are keyed six knife heads, each carrying two blades. The knives are the exact size of the slot to be cut in the tie, to wit, 8¼ inches, and the heads are placed at the distances one from the other that the stringers will be laid. This knife shaft is driven by a 10-inch pulley, connected with a counter shaft, and makes 2000 revolutions a minute. The operator places six ties on the carriage side by side, and grasping the crank moves the carriage up until the knives come in contact with the upper surface of the ties. The ties are held firmly down on the carriage by two levers weighted at the end, and placed one on each side of the knife shaft. As the knives strike the wood, the carriage is moved forward by means of the ratchet and crank, and in about three minutes the slots are cut out, and every tie is of exactly the same dimensions. It is a wonderful labor-saving device. A patent has been applied for.

ARE ELECTRIC STATIONS MANUFACTORIES?—We should say not, if the term is used in its ordinary sense and acceptation. A steam engine is not a manufactory; neither is a water-wheel or a wind-mill. All these deal with force, transforming and adapting it to a useful end. But within themselves they manufacture nothing, though they may furnish the motive power by which manufacturing is accomplished. It does not matter, so far as the principle is concerned, whether steam or electric energy is generated. If either is applied to the production of a commodity, we have then a manufacturing industry, but not otherwise. The question is not a frivolous one, nor an abstract speculation merely, but has been raised on very practical grounds, there being a discrimination in the tax laws of some localities between manufacturing and other kinds of business. When such a distinction is made, it is usually in favor of manufacturing, which all communities are disposed to encourage. Taking the common sense view of the matter, which, after all, ought to be decisive, an electric station should be admitted to any favor of this kind as much as a rolling mill or a piano factory. Whatever its status may be in a literal or technical sense, it bears precisely the same relation to the public interest, to growth of population and increase of wealth, and should be dealt with accordingly. The law ought to conform, if the lawyers can afford to permit it to do so, to the obvious merits of the case.—*The Mechanical News.*

CLAYTON
AIR COMPRESSORS
For Working
Rock Drills, Coal Cutters, Hoisting Engines and Water Pumps in Mines and Tunnels, Sinking Caissons, Etc., Etc.
SEND FOR CATALOGUE No. 6.
Clayton Air Compressor Works,
43 DEY ST., NEW YORK.

G. & E. PENNINGTON & SONS,
STEEL WORKS.
MANUFACTURERS OF
Best Refined Cast Tool Steel, Machinery and Hammer Steel,
Steel Piston Rods, Shear Blades, Lathe Spindles, and all kinds of Steel Forgings Made to Order.
REFINED BAR STEEL IN OCTAGON, ROUND, SQUARE OR FLAT, MADE IN SIZES AND LENGTHS TO ORDER.
Miners' Drill Steel, Picks, Crowbars, Sledges, Hammers, Etc.
Chaine all Sizee and Lengths Manufactured to Order. N. B.—Drill Steel, any Length from one to thirty feet.
OFFICE AND WORKS:
218 and 220 FOLSOM STREET, - - SAN FRANCISCO, CAL.

—THE—
JOSHUA HENDY MACHINE WORKS,
Nos. 39 to 51 FREMONT STREET, SAN FRANCISCO, CAL.



"HENDY" IMPROVED "CHALLENGE" ORE FEEDER.
THE BEST FORM OF FEEDER EVER DEVISED,
And pronounced by reputable mining men to be far superior to any other, as the fact that over 8000 have been placed in successful operation fully demonstrates.
WE ARE ALSO MANUFACTURERS OF THE
"STANFORD," "TULLOCK" AND "ROLLER" FEEDERS,
And will furnish descriptive Catalogues and quote prices upon application.

THE A. LIETZ CO.,
MANUFACTURERS OF
SCIENTIFIC INSTRUMENTS.
DIRECTORS:
A. LIETZ. C. WEINMANN. OTTO VON GELDERN. E. T. SCHILD. C. E. GRUNSKY.
MAKE A SPECIALTY OF INSTRUMENTS FOR THE
Mining AND Civil Engineer.

Examinations, Adjustments and Repairs,
Field and Office Supplies Kept in Stock,
Illustrated Catalogues on Application.
422 SACRAMENTO ST., SAN FRANCISCO, CAL.
ADOLPH LIETZ, Examiner and Adjuster for the U. S. Surveyor General.

FRANCIS SMITH & CO.,
MANUFACTURERS OF
SHEET IRON & STEEL PIPE
FOR TOWN WATER WORKS.
Hydraulic, Irrigation and Power Plants, Well Pipe, Etc., all sizes.
NO. 130 BEALE STREET, SAN FRANCISCO, CAL.
Iron cut, punched and formed, for making pips on ground whers required. All kinds of Tools supplied for making Pips. Estimatee given when required. Ars prepared for coating all sizee of Pipes with a composition of Coal Tar and Asphaltum.

Educational.

JOHN T. EVANS,
Assay Office and Chemical Laboratory,
ROOMS 46 AND 47 MONTGOMERY BLOCK, 628 Montgomery Street, San Francisco. For nearly 15 years with Thomas Price, as Chief of the Ore-Assay and Analytical Department. Lessons given in Assaying and Chemistry.

School of Practical, Civil, Mechanical, Electrical and Mining Engineering,
Surveying, Architecture, Drawing and Assaying,
723 MARKET ST., SAN FRANCISCO, CAL.
Open all year.
A. VAN DER NAILLEN, President.
Assaying of Ores, $5; Bullion and Chlorination Assay, $25; Blowpipe Assay, $10. Full Course of Assaying, $50.
ESTABLISHED 1864. Send for Circular.

HEALD'S
BUSINESS COLLEGE,
24 POST ST., S. F.
FOR SEVENTY-FIVE DOLLARS THIS College instructs in Shorthand, Type Writing, Bookkeeping, Telegraphy, Penmanship, Drawing, all the English branches, and everything pertaining to business for six full months. We have sixteen teachers, and give individual instruction to all our pupils. Our school has its graduates in every part of the State.

RISDON IRON WORKS PAYS THE FREIGHT.

Common Sense New Steel Whim
All Complete for $125, Freight Prepaid to any Railroad Station in California.

No cog wheels or clutches to break. Ninety per cent of this whim is wrought iron and steel, and will spring or bend instead of breaking, and besides, can be repaired at any blacksmith shop should breakage occur, thus obviating the necessity of sending away hundreds of miles sometimes and waiting a week for repairs. It can be packed anywhere a jack can go, the heaviest piece weighing 300 pounds. Total weight, 800 pounds.
It is just the whim to open up mines in isolated camps where steam power and experienced men are hard to get. With one horse 25 tons can be hoisted 300 feet on each shift. It is just as safe and reliable as an engine. Over 1800 in use, some running eight years without one dollar's expense. We make two, four and eight-horse power whims for heavy mining, also derrick whims and everything pertaining to horse power hoisting.
Buy a good whim and put more money into underground work is the way to open up a mine and make it pay.
For circulars and cuts giving full information, write to

MECHANICAL PROGRESS.

A STEEL CHIMNEY.—One of the most notable achievements in the rapidly multiplying applications of steel to structural purposes is the new chimney of that material in Chicago, the dimensions as given being a height of 250 feet, with an outside diameter of 9 feet 5″, while the steel varies in thickness from 5-32″ at the top to ⅜″ at the bottom. The lower 75 feet of the chimney is lined with firebrick 8″ deep, formed to fit the shell compactly all around, and above this is lined with hollow tile. This lining is supported at intervals of 25 feet by an angle iron riveted to the steel shell—that is, the chimney is lined in a manner similar to blast furnaces and foundry cupolas, no expansion by heat being able to lessen its strength, and the joints are all hot riveted. The steel shell is carefully protected from corrosion and from any attacks by the weather by painting inside and out. The weight of the chimney is spread to the foundations in the same manner or general way as that of the columns of the building, the base or foundation on which it rests being constructed similarly. The ground, first, is covered with a layer of cement, then two layers of steel rails in cement and one layer of I beams, on which the cast-iron shoe which takes the shell of the stack rests. The capacity of the chimney is twelve 60″ boilers, 20 feet in length. The outside diameter of this chimney is 9 feet 5″, while were it constructed of brick, it would be 16 feet 6″. Scientific Machinist.

WIRE GLASS.—Under the name of wire glass, a new invention has been brought on the market by a Dresden firm which marks an important development in the glass-making industry. The process of manut facture consists in furnishing glass in a hoplastic condition with a flexible metallic layer, iron wire netting, for instance, which is completely enclosed by the vitreous substance and effectively protected against exterior influences, as rust, etc. The new glass, which has been patented in the leading countries, possesses much greater resisting power than the ordinary metal, and is, it is claimed, indifferent to the most abrupt changes of temperature, and will even withstand open fire. A further proof of its toughness and durability is stated to be the fact that it may, in a highly heated state, be sprinkled with cold water without being materially damaged. The glass is specially adapted for skylights, the powerful resisting qualities of the material enabling the usual wire protectors to be dispensed with. As wire glass cannot be cut by the diamond, except under the application of great force, and cannot be broken without creating considerable noise, the substance is claimed to be, in a measure, burglar-proof.

DIRECT PROCESS.—Strange as it may sound to many who have not carefully followed the progress recently made in the iron and steel industries, iron puddling promises to soon become one of the lost arts, or at least, to be reduced to very insignificant proportions. By the direct process, steel is now made with but a small percentage of the labor that must be employed to produce iron through the process of puddling. So great is the saving in this regard that steel is already cheaper than iron. On this account, and by reason of its greater value for most uses, it is fast superceding iron. It is predicted that in a very short time it will almost entirely supplant iron in the manufacture of almost all forms of agricultural implements and machinery, and in scores of other great manufacturing interests. The wages of the puddler are already very low, and must now suffer another cut. If iron is to compete with steel at all, wages must soon be reduced to a point at which men cannot afford to labor. The age of steel has indeed arrived, and the puddler will soon find his occupation gone.—Chicago Journal of Commerce.

STEEL wire seating for railway car seats is being used in England, and is said to be taking the place of the padded and volute spring seats. The new seat is composed of minute steel wire rings compactly knit together, over which only a thin layer of hair or a pad of felt is necessary. The London & Northwestern Ry. has already fitted 653 to car seats and sleeping car berths, while the Great Eastern Ry. has in use nearly 5000.—Engineering News.

THE new insulator termed chicle, is produced in the States of Campeche and Yucatan, Mexico. Chicle, the sap of the sapodilla tree, is extracted like camphor, india rubber and other gum; it is an insoluble substance, and it is said to be now used extensively as an insulator.

USEFUL INFORMATION.

TESTING EMERY WHEELS.—A mechanic recently learned a lesson about emery wheels by nearly getting killed by the bursting of one of them. The wheel was left running while he went out of the room on an errand. As he came back, a piece of the wheel came to meet him, passing within a foot of his head. Luckily no damage was done except to a window, the sash and glass of which went out of doors in company with the broken wheel. There is no need of having such a thing happen. Let a man take an emery wheel in his hand, place the forefinger of his left haud in the mandrel hole of the wheel, with a small wooden mallet (never use a hammer) tap the wheel lightly, and note the sound given forth by the blows. A crack can be quickly detected in this way, and if every wheel was thus tested when it came into the shop, and if the practice were followed up every time a wheel is placed upon the mandrel, there would be no accidents from broken emery wheels.—Woodworker.

CYPRESS TIMBER.—Cypress timber grows very tall, straight and thick, in isolated patches or groups called "brakes," in the shallow swamps, lakes and bayous, usually in from one to five feet of water, and, under favorable conditions, attains an enormous size. The trunk is straight and without limbs often to a height of 75 feet or more, and large trees measure 120 feet in height and 25 feet and over in circumference about the base, which at the ground is often three or four times the diameter of the trunk. Authorities disagree as to the varieties. some claiming that there are three kinds—red, white or yellow, and black—while others claim that they take their names from the color of their heart wood, which varies according to soil and conditions. The white or yellow variety grows largely in Arkansas, while the red and black varieties are found in Louisiana and other Gulf States.—West Coast Lumberman.

INDIA RUBBER PAVEMENT.—A German engineer has paved a bridge with india rubber, and the result has been so satisfactory that it is to be applied on a larger scale. It is found to be more durable than asphalt, and not slippery. "A section of roadway," says the *Railway Review*, "under the gate leading to the departure platform of the St. Pancras terminus, London, has for some years past been paved with india rubber, and many people must have been pleasantly surprised at the deadening of souod when passing over it on wheels, and at the grateful elasticity to the tread when traversing it on foot."

A SEWING MACHINE has been invented which stitches easily and rapidly through layers of leather five-eighths of an inch in thickness, this having been accomplished on a first exhibitory trial; in a second trial, stitches were made evenly and rapidly through a piece of bird's-eye maple three-eighths of an inch thick, and in a third test, the still more remarkable feat was achieved, viz., that of sewing through a layer of brass one-eighth of an inch thick, placed between pieces of leather.—Manufacturers' Gazette.

GLASS BRICKS.—For some time past, transparent glass bricks have been let into the walls to afford light at places where a window would interfere with the architectural plan. But now it is proposed to cast glass, not necessarily transparent, into large blocks for buildings. The material is practically indestructible, perfectly nonabsorbent, and, therefore, damp-proof in a manner which few bricks are, and in this way coarse glass of this kind could be made nearly as cheap as concrete, stone or baked clay.

A DOG belonging to Hercules Tyrius was one day walking along the seashore, when he found and ate a murex, a species of shellfish. Returning to his master the latter noticed that the dog's lips were tinged with color, and in this manner Tyrian purple was discovered. The color was used in the robes of emperors and nobles, and the expression "born to the purple" meant that the person was of high birth.

A CORRESPONDENT of the *Lancet* cites a number of instances in which the appearance of influenza immediately followed the receipt of a letter from an infected place. He thinks the source of the infection was the saliva used to moisten the postage stamp.

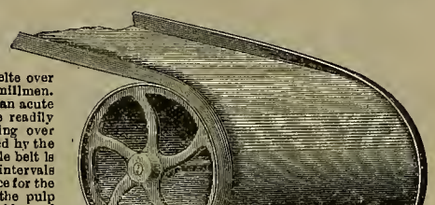
145 BROADWAY, NEW YORK.

THE BLASDEL CONCENTRATING BELT COMPANY.



We have now made arrangements to have our new Improved Concentrating Belt manufactured in San Francisco. We keep always on hand Belts suitable for the Triumph and Frue machines, but can make any length or width desired. The advantages of these belts over *any others* will be readily seen by practical millmen.

First, the flanges or edges of our belt stand at an acute angle inclining toward the center, and therefore readily conform to the change of direction while passing over the end rollers; thus the vexation and loss caused by the frequent breaking of the flanges of the old style belt is practically done away with. Again, our belts, at intervals of two to four feet, have a very slight riffled surface for the space of three inches, which tends to equalize the pulp on the belt, and prevents it from banking on the sides and forming channels through the center. These slight riffles also save very fine sulphurets and the quicksilver that could otherwise escape with the tailings from a belt, the surface of which is entirely smooth. We can safely say that it is a better belt than has ever been manufactured for use on this coast. It will last much longer and will handle fully one-third more pulp than any smooth belt, and will save a higher percentage of sulphurets

H. G. BLASDEL, Jr., Manager, 419 California St., San Francisco.

SCIENTIFIC PROGRESS.

Fiber Graphite.

Fiber graphite, which was invented some two years ago, appears to he rapidly acquiring prominence as an antifriction material for journal-bearings on account of its valuable property of dispensing with oil as a friction-reducing agent, thus eliminating from all machinery plants a considerable item of expense. Fiber grapbite is composed of two materials—hardwood fiber and grapbite. It is manufactured by the following process:

Hardwood fiber is reduced to a pulp; graphite is then added in a powdered state, and this material is taken to a mould, which consists of an iron box or tub, witb several very small boles in the bottom. Tbe wood fiber and graphite are placed in this mould, water is added, and bydraulic pressure is applied. The compression causes the water to escape by the boles in tbe bnttom of the mould, and in its outflow it causes the wood fiber to take a perpendicular position; and as the wood fiher prevents the graphite from escaping, the latter is compressed between the fibers, which are tbemselves coated with plumbago, and the result is a dense mass of fiher graphite. When taken from the mould, the material is in a finished condition, and has a very smooth satiny surface. After heing removed from tbe mould, it is dried in tbe atmosphere for a short time, after which it is thoroughly saturated with purified linseed-oil and haked in an oven. This last operation leaves the substance ready for use. The wood fiber, in taking a perpendicular position, presents the ends of the fibers to tbe shaft, thus reducing tbe wear on the journal. In the form of a journal-bearing, fiber graphite is a solid lubricant, plumbago being one of the best lubricators known. The first few turns of a sbaft in a fiber-graphite journal fill the pores of the steel, and also give tbe shaft a very tbin coating of the new material.

Spontaneous Ignition of Wood Pulp.

Some interesting experiments were recently made in Boston by Edward Atkinson, to determine some questions relating to the spontaneous ignition of wood pulp. According to an exchange, the experiments were made in an Alladin oven, with a thermometer to indicate tbe temperature. Two slabs of wood pulp were tied in tbe oven, one in contact witb a loose iron sbelf, the other without any contact. The first ignited at 370, the last at 430 degrees. In two previous tests, the oven was open wben tbe thermometer reached 425 degrees, but the pulp did not take fire until the introduction of air, when it ignited instantly. In speaking of tbe matter, Mr. Atkinson says:

"We have been able heretofore to imitate spontaneous combustion by putting animal or mineral oil on fibrous substances; we have tried experiments by mixing mineral or paraffine oil with animal oil to determine the exact point or proportion at which the paraffine or mineral oil will prevent oxygenation of animal or vegetable oil, but there has been no apparent means of making this oxygenation visible until tbe present test. This test may explain the cause of many fires. Heretofore there bas been no knowledge of the ignition by rapid oxygenation of a highly heated substance, mostly carbon or almnst pure cellulose, witbout any admixture of grease or chemical. It would appear that finely divided and moderately beated carbonaceous material, holding air in its pores, may ignite at a relatively lower temperature than ordinary wood. It would seem well, therefore, to avoid the use of sawdust for sweeping floors, and its storage near bot kitcbens. Ice bouses are known to be bad risks. A little gudgeon grease in the sawdust is said by some to explain tbe reason."

PASTEURIZED MILK.—All methods of sterilizatioo that are in use in this country have the disadvantage of giving to the milk the taste which is peculiar to boiled milk, and also of rendering it less easily absorbed by the body. In France and Germany a method has been adopted which accomplishes the purpose without injuring the taste of the milk. Machines are in use in Paris and some otber cities which will heat great quantities of milk to a temperature of about 155° Fahr. for a few minutes, and tben cool it rapidly to a low temperature. The method has been called the pasteurization of milk. It does not kill all the bacteria, but it does destroy so many of them that it greatly increases the keeping properties of the milk. Moreover, it almost entirely destroys tbe danger from disease germs in milk, since nearly all forms likely to occur in milk are killed by this temperature. The advantage of this metbod is that the temperature of 155° Fabr. does not give to the milk the taste of boiled milk, which most people find unpleasant, and does not render the milk difficult nf digestinn. These pasteurizing machines have not yet been introduced into this country, and the opportunity exists for some one to develop a thriving business by furnishing pasteurized milk in our large cities. A little experience with its superior keeping properties, and a little knowledge of its great wbolesomeness, would soon create a demand for it in America, as it has already done in the larger cities of France and Germany.—Prof. H. W. Conn in Popular Science Monthly.

THE ALBERT MEDAL.—Mr. Edison has been awarded the Albert Medal of the Society of Arts for the present year, in consideration of tbe distinguished services rendered by him to the progress of electric-lighting, telegraphy and the telephnne. This medal was instituted in 1862 as a memorial of the Prince Consort, for 18 years president of the society, and is awarded annually for distinguished merit in promoting arts, manufacturers, or commerce. It was first awarded, in 1864, to Sir Rowland Hill, and among the distinguished men of science wbo have since received it are included the names of Faraday, Wbitworth, Liebig, Lesseps, Bessemer, Siemens, Armstrong, Thompson, Joule, Hofmann and Helmholtz. In 1887 it was presented tn the Queen on the occasion of her jubilee. This is the second occasion on which it has been awarded to an American. In 1884 it was given to Mr. (not, as is often stated, Captain) Eads, in recognition principally of bis great engineering works at tbe mouth of the Mississippi.

MAGNETIC PROPERTIES OF ALUMINIUM IRON.—Two pieces of metal containing respectively one-balf and one-eighth per cent of aluminium alloyed with cast iron were recently tested by Mr. C. Eickemeyer at the laboratory of Cornell University, the results of which were published in *The Crank*. The Eickemeyer differential magnetometer was used in the test and the aluminium iron was balanced with a test piece of Norway iron, tbe magnetic characteristic of wbicb was known. The properties of these twn, however, were sn very similar that more accurate results were obtained by comparing tbe aluminium iron witb a piece of cast iron which had already been tested by comparison with tbe standard Norway iron. In the test the piece contalning the smaller per centage of aluminium proved to be superior. The aluminium has no very marked influence upon the magnetic conductivity of cast iron, but slightly decreases its permeability.

ELECTRICITY.

Storage Battery Traction.

In a recent paper read before the Franklin Institute, Mr. Salom reviewed the present status of the storage battery system of electric street-railway propulsion. He summarized the subject under the following heads: First, why is it that so promising a field in electrical engineering has as yet produced no adequate commercial results? Secondly, what definite knowledge has been gained by the trials and failures of the past? Tbirdly, what are the prospects of the future for the introduction of storage battery traction? Regarding the first, he said patent litigation was largely responsible, as capitalists did not like to invest in a plant whicb might subsequently be adjudged an infringement. Until the patent question was decided, the companies in litigation were hardly in a position to construct elaborate experimental plants. Regarding the second heading, he reviewed the various problems which come up, and reported a case where a single set of accumulators made over 6000 miles before tbe plates gave out; this was on a road in Indianapolis. Assuming that a battery could make 100 miles a day, this means a renewal every 60 days, wbich, he says, represents a cost of operating of about 3.85 cents per car mile for battery depreciation. He states that there have been no improvements so far whicb diminish the number and weight of tbe batteries. Under tbe third heading, he states that the introduction of storage traction for surface roads in our large cities is inevitable, and that the trolley may be introduced at the present time, pending the solution of the difficulties under which storage batteries have come into disrepute, but, in the long run, the obvious advantages of the storage system must be recognized. He claims that there are no insurmountable difficulties beyond the fact that it costs a few cents a car mile more than the trolley, and, when the public recognizes this, the introduction will be inevitable. He deduces the fact that the additional operating cost of the batteries system over the entire cost of the trolley system does not exceed four or five cents per car mile, which represents the saving on the West End road of electric traction over horse traction, namely, the difference between 21 and 25 cents per car mile; this brings storage battery traction up to the cost of horse traction, but the advantages over the latter are so great that they cannot fail to be recognized. All the slander and ridicule that have been heaped upon storage batteries, he says, does not alter tbeir capacity to do a certain amount of work for a given cost per watt bour. "Give the storage battery a chance, and let tbe same engineering skill be applied to the storage system as has already been done with the trolley, and tbe results will be surprising." We agree with Mr. Salom in most of the statements which he makes, more particularly witb tbe last sentence, to the effect that if the same amount of money, energy and attention were given to storage battery traction as bas been given to the development of the trolley system, what are now difficulties would readily be overcome. Although the advantages of the trolley over horses are unquestioned, yet there are special cases in the hearts of cities where overhead wires are objectionable, at least if there is a possibility of being able to do without tbem, and it is tbis field which the storage battery and the conduit system are destined to occupy sooner or later.—Chicago Journal of Commerce.

AT THE WORLD'S FAIR.—Sunday's issue of the New York *Herald* contains an article on the World's Columbian Exposition. Speaking of the electrical features of the Fair the article says: Twenty years ago little was known of electricity outside of the telegraph. At this exposition it requires a building of nearly six acres to hold the different electrical inventions, and Edison alone will use up about an acre of space. An electricity firm of Berlin wants nearly an acre, and this firm has offered to spend $200,000 on its electrical exhibit. Edison is getting up new matter for the Fair, and he proposes to show his kinetograph and other things which will be new. The exhibition of electricity in lighting and in power production will be shown in the different buildings in a way never dreamed of before. The electric plant of the World's Fair will cost more tban $1,000,000, and electricity will turn night into day. The electrical water display will surpass anything ever attempted. The great basin which runs from tbe lake to the Administration building will be encircled with electric lights, and lights will be sunk under the water, and the effect will be a lake of gold. The fountain will flow over electric rays of all the colors of the rainbow, and there will be search lights, arc lights and all sorts of electrical appliances, even the most wonderful fireworks operated by electricity and made to go off by the playing of the keys of a piano-like instrument, so that they will change at the will of the player and produce wonderful fire pictures.

RAILWAY ELECTRICITY.—The meeting of the railway superintendents, held in Denver, Col., served to bring out strongly tbe intimate connection, in many ways, between the modern railway and the electric current. Beyond the now indispensible adjunct of the telegraph, the electric signal and many minor applications, railway managers are brought face to face with that larger and more important subject of electric traction, and it is well that Mr. Charles Selden drew the attention of his colleagues to matters which they may be called upon, at any time, to seriously consider in their daily work. The figures he gave as to the relative proportion of net profits to operating expenses of steam and electric roads were very significant as showing the greater remunerativeness of electric railways. To be sure, the traffic of both is somewhat different in its nature, but even to-day suburban roads, which are now barely paying expenses, as Mr. Selden pointed out, could be made profitable, and we are glad to learn that if the experiments about to be undertaken by the Baltimore & Ohio road, at Baltimore, in the application of heavy locomotives to the hauling of their trains through the tunnel proves successful, it will be followed by the converting of the suburban steam road of the Baltimore & Lehigh Railroad into electric. The prospects and limitations of electric railroading on the standard-gauge roads as discussed from a mechanical and electrical standpoint in Mr. Frank J. Sprague's inaugural address, before the American Institute of Electrical Engineers, in Chicago, must be viewed with satisfaction by all electrical engineers interested in the progress of electric railroads, inasmuch as the conservative tone adopted by Mr. Sprague will serve to instill confidence in the minds of many who are prone to look upon the somewhat visionary schemes of some electrical promoters as the prevailing ideas of the general body of electric railway engineers.—Electrical Engineer.

THE experiment of the killing of cattle by electricity will soon be tried at the Aberdeen abattoir, where the electric plant is now being installed. If the experiment proves that this manner of killing cattle has no bad influence on the quality of the beef, the application of electricity will hereafter be general.

Machinery for Sale

FOR SALE CHEAP.

One 80-H. P. Taylor Beck High Speed Engine, in use but four months; 11½x15—replaced on account of size by 200 H. P. Ball Engine, at power house of Santa Cruz Electric Railroad. In first-class condition.

ALSO, The following Second-Hand Steam Pumps:

No 2 BLAKE, 4" steam, 2⅜" water, 5" stroke.

No. 10 HOOKER, 14" steam, 6" water, 16" stroke.

No. 6 THOMPSON & EVANS, 6" steam, 4" water, 10" stroke.

No. 8 CAMERON, 10" steam, 6" water, 13" stroke.

No. 4 DOW, 5½" steam, 3½" water, 8" stroke.

No. 6 DEANE 7½" steam, 5" water, 10" stroke.

DEANE DUPLEX, 6" steam, 4" water, 8" stroke.

WORTHINGTON DUPLEX, 6" steam, 4" water, 8" stroke.

ALSO,

CENTRIFUGAL, ELECTRIC and POWER PUMPS.

ADDRESS

RISDON IRON WORKS,

San Francisco, California.

The only Complete Treatise on the Brewing of German Beers in the English Language.

THAUSING.

The Theory and Practice of the Preparation of Malt and the Fabrication of Beer;

With especial reference to the Vienna Process of Brewing. Elaborated from personal experience by JULIUS E. THAUSING, Professor at the School for Brewers, at the Agricultural Institute, Modling, near Vienna. Translated from the German by WM. T. BRANNT, Graduate of the Royal Agricultural College of Eldena, Prussia. Thoroughly and elaborately edited with much American matter, and according to the latest and most Scientific Practice, by A. SCHWARZ, Graduate of the Polytechnic School in Prague, Director in the First Scientific Station for Brewing in the United States, and DR. A. H. BAUER, M.A.C.S., Analytical Chemist.

Illustrated by 140 Engravings, including the Most Approved Machinery.

IN ONE VOLUME, OCTAVO, 815 PAGES. PRICE, $10.

Sent by mail, free of postage, at the publication price, to any address in the world.

An illustrated circular, 8 pages, 4to, giving the contents of this remarkable book will be sent free to any one who will furnish his address.

☞ Our new revised Descriptive Catalogue of Practical and Scientific Books, 88 pages, 8vo, and our Catalogue of Books on Steam and the Steam Engine, Mechanics, Machinery, and Dynamical Engineering, and other Catalogues, the whole covering every branch of Science applied to the Arts, sent free and free of postage to any one in any part of the world who will furnish his address.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned

CALIFORNIA.

Amador.

KENNEDY.—*Ledger*, July 2: They are putting up new sulphuretz works at this mine. The present works were built under contract, and are entirely inadequate to the requirements. The new and larger works will occupy the same site, so that a great deal of the present plant will be utilized, just as it stands.

DAYTOWN.—Cor. *Record*, July 2: We visited the Gover mine and were lowered to the 700 foot station, where the large electric pump is in position, capable of throwing 134,000 gallons in 24 hours when driven to its full speed. We were then taken to the end of the tunnel running 500 feet south, and shown a two-foot ledge that was encountered the day before, that would mill about $20 per ton. After climbing about in the different stopes, we again boarded the skip and were lowered to the 800-foot station, but, it being near supper time and the shaft full of powder smoke, we didn't make any further explorations. A small seam of very good rock is being taken out of the bottom of the shaft, which pays about $30 per ton. The contractors are making satisfactory headway, considering the hardness of the ground. During the past year, the shaft has been newly timbered with 14 and 16 inch square spruce timbers. Everything about the mine is working in first-class order. The new self-dumping apparatus lately put in is a great improvement both as a time and labor-saving machine, and it works to perfection.

Butte.

TO TURN A RIVER.—Sacramento *Record-Union*, July 5: There will be lively times about Oroville soon, when Major McLaughlin turns the Feather River from its channel into the great flumes and tunnel that have been prepared for it. The river has now fallen so low that it is thought that this can be done within a couple of weeks.

A week ago two of the biggest shareholders in the English syndicate, J. F. Kelley and O. Harvey, dropped in upon him from London, and were escorted to the works near Oroville. They spent some days looking over the preparations that had been made for the great event and in inspecting the engineering works in which their capital had been sunk. They were pleased. The enormous flume into which the Feather River will be diverted was found to have been constructed in the most substantial manner, and could only be imperiled by a sudden freshet which would swell the river beyond its usual summer volume. But at this time of the year such an occurence is not to be feared. The Golden Gate and the Golden Feather claims extend about 8,000 feet along the stream. The dirt lodged beneath the bed of gravel, which extends down to a depth of 18 feet, is supposed to contain great quantities of gold which has been washed down from the hills in the course of ages. It is even more than a supposition, for when the works were completed last year the river was turned aside and a prospect of the claims made. The dirt that was recovered was rich in gold, and gave heart to the investors who had been induced to put their guineas into the Major's brilliant project. It was at that time too late in the season to think of beginning operations on a large scale, for the autumnal rains were coming on, and the dam was opened, permitting the Feather to flow on in its destined course. This year, however, the labor of removing the bed of gravel and getting at the pay dirt will be begun in time to give the miners at least three months' work. A great army of men will be employed, and Oroville will again assume the appearance of a prosperous mining camp.

GRAVEL.—Oroville *Register*, July 2: Mr. J. D. Campbell, Superintendent of the Catskill Blue Lead Gravel Mine at Bangor, was in Oroville yesterday and in conversation with him and W. W. Will of the Bishop Mine, Mr. Campbell said: "We have 27 men at work with us now but expect to increase this number to 100. About the first of July we will begin sinking a new shaft and it is the intention of the owners to drive this shaft down in the center of the mine so that it will drain from all directions. It will take till the last of October or the first of November before the shaft is completed, the tunnels run and all things prepared for working the mine systematically. The gravel pays regularly and is rich enough to warrant large expenditures in opening the mine properly. I was surprised to find such a large and rich channel so low in the hills. Most of the rich gravel channels are high in the mountains, but this one is richer than any with which I am acquainted and I believe that it will prove the richest and best in all California. It will pay $10 a ton right through and bed of gravel are extensive enough to last for the next fifty years. I am confident that within the next year there will be 1,000 miners employed between the Honcut and the Turner place. The gold is a light, scale or bran gold, but it is distributed evenly and the pay is regular.

Colusa.

A FURNACE.—Lower Lake *Bulletin*, July 2: Mr. Lenus has commenced the erection of a quicksilver furnace at the glades near Sulphur Creek, Colusa county. A very lively summer and fall is expected to be the experience of our enterprising neighbors just across the line.

Lake.

QUICKSILVER.—Lower Lake *Bulletin*, July 2: Harry Lightner, superintendent of the Abbott quicksilver mine, went below Saturday, to return in a few days. He is now working about 60 men, and his output of the slippers metal is a very profitable one. Fred. Formhals, Esq., of San Francisco, a quicksilver furnace builder, has been in town during the week on business connected with his profession. It is expected that he will do considerable work at the Abbott mine and other places in that vicinity during the present summer and fall.

Mono.

BONIE CONS.—*Miner*, July 1: During the past week east cross cut No. 1, 700 level, was extended 6 feet. East crosscut No. 1, 550 level, was extended 5 feet. North drift from above crosscut was extended 5 feet. The ore in face of drift is about 6 inches wide. Upraise from above drift was extended 9 feet. The ore in upraise is about the same size as in drift.

THE MONO.—During the past week west crosscut No. 3, 700 level, was extended 7 feet. North drift, 600 level, was extended 10 feet. Upraise No. 1, 600 level, was extended 26 feet.

Nevada.

GOOD CLEANUP.—Grass Valley *Telegraph*, June 28: Rodger Shackelton & Co. have been working on tribute at the New Rocky Bar, and have been doing well. The place in the mine where they are working is at a depth of about 120 feet, and the ledge is very flat. On Monday evening the tributers had a crushing at Joe Southern's mill, and the yield was $45 per load. There were 30 loads put through the mill.

San Diego.

READY RELIEF.—Cor. *San Diegan*, July 1: This property is owned by the Baily Bros., and is regarded as being the boss of the camp. Its labyrinth of tunnels, crosscuts, stopes and shafts, together with its railway tracks, give the Ready Relief the appearance of an underground town. There has not been as much ore as people suspected taken from the mine. The owners cunningly kept on developing its resources, and it now turns out that Banner has a daisy mine. The new water power works to a charm, as recent crushing proved. In fact, it is preferable to steam, as it handles the stamps with more regularity. Lately 80 tons were run through from the Hubbard mine, which, I am informed, turned out well. Also a large quantity from the Wilcox contract, the value of which I am uninformed. The finest and most valuable of the late crushings came out of the Hidden Treasure. It milled $80 to the ton. This also belongs to Baily Bros.

THE O'NEILL MINE.—Cor. *San Diegan*, July 2: Since the closing down of the Stonewall mine, a feeling of sadness prevails among the working classes. But better times are looming up. The recent crushing at the Noble mill on ore from the O'Neill mine at Deer Park was a surprise. The clean-up was much better than predicted, taking into consideration the difficulties of working the mine on account of the mammoth size of the ledge, and more particularly the scarcity of money to develop its resources. However, the difficulties are now surmounted. The O'Neill, in my opinion, will eclipse the Stonewall, for the reason that at 30 feet depth the O'Neill ore milled $10.80, with an eight-foot ledge. The O'Neill will be hard to beat.

Siskiyou.

QUARTZ AND GRAVEL.—Yreka *Journal*, June 26: Andrew G. Meyers, who in connection with Mr. Stearns, intends working the old Bellville hydraulic claim on Jackson Creek, a tributary of South Fork of Scott River, has a large stock of hydraulic pipe now on the way from below, with intention of working the claim on a very extensive scale. R. H. Campbell, of the Quartz Valley hydraulic mine, is now busy fixing up matters towards turning the property over to an English syndicate. When everything is complete and turned over to the new company, lively times may be anticipated in Quartz Valley, as a large force will be set at work in developing the mining ground of that section, by using the giants while the water holds out, and then by drifting the balance of the year when water is scarce. Some excellent quartz has been taken out at the Empire mine at Klamath River lately, and crushings made with good success, under the management of ex Supervisor Jehu Jacobs. The Golden Gate Company, comprised of business men of Yreka, keep a force steadily at work running a tunnel into the Humbug Mountain west of town, from a point on Humbug Gulch, some distance above Yreka Flats. It is expected that quartz ledges or good pay gravel may be found, also an abundance of water. Arthur and Louis Scheld have been getting some quartz out of their upper ledge on Long Gulch, called the Rattler, which is a fine two foot lode, for the purpose of testing its richness. They also crushed 4500 pounds from their lower ledge called the C. O. D. Mine. The Phil Mott claim at Klamath River, below Honolulu, paid exceedingly well in the cut just finished, and the men are now sinking down on a new cut with still better prospects.

NEVADA.

Washoe District.

CON. CAL. & VA.—*Chronicle*, July 2: There has been extracted from all parts of the mine during the week 992 870-2000 tons of ore, which was shipped to the Morgan mill, the average value of which per car samples was $28.98 per ton. The average assay value of all the ore worked at that mill during the week was $25.30 per ton per battery samples. There was worked at the Vivian mill during the week 140 tons of ore, the average assay value of which, per battery samples, was $20.81 per ton. Bullion shipped to Carson Mint, assay value, $40,884.28.

OPHIR.—1465 level—The drift running south 101 feet below the sill floor of the 1465 level, from the Mexican into the Ophir ground has been extended during the week 17 feet; total length 147 feet, continuing in a mixed formation of porphyry, clay and quartz which carries a very low assay value.

MEXICAN.—On the 1465 level the drift running north from the crosscut run east from the bottom of the winze sunk 101 feet below the sill floor of this level near the south boundary of the mine, at a point 40 feet east from the winze, has been advanced 21 feet; total length 122 feet; in porphyry and clay.

UNION CON.—900 level—The joint Union Con. and Sierra Nevada west drift has been extended during the week 23 feet; total length west from the joint shaft 2156 feet. The face is in porphyry with small seams of quartz.

UTAH.—340 level—The north drift from the west crosscut from the shaft station has been extended 47 feet; total length 348 feet. The formation continues in harder porphyry, showing some clay and water.

SIERRA NEVADA.—The joint Sierra Nevada and Union west drift, 900 level, was extended during the week 23 feet, making a total distance west of shaft of 2156 feet; face in porphyry and small seams of quartz.

GOULD & CURRY.—On the Sutro tunnel level the joint upraise with the Savage Company has been carried up a distance of 20 feet; total height 180 feet; face in porphyry and stringers of quartz. We have started a joint winze on the Savage 1500 level to meet this upraise; this winze is now down 25 feet.

BEST & BELCHER.—900 level—West crosscut No. 1 has been advanced 18 feet through hard porphyry; total length 360 feet. At a point in east crosscut No. 1, 100 feet from our main north drift, started north on a small stringer of quartz and advanced same a distance of 20 feet.

HALE & NORCROSS.—Shipped to Brunswick mill during the week 81 920-2000 tons. Ore shipments to Brunswick mill were stopped on the 26th ult., having on that date completed cleaning out all the ore remaining in the ore house. Average battery assay for the week $27.68. Shipped to U. S. Mint, Carson, yesterday 452 pounds crude bullion.

CHOLLAR.—Repairing the north drift on the 550 and 750 levels. The east crosscut in the north drift from the 630 station near the north line is in 32 feet; face in clay and porphyry.

POTOSI.—The joint Bullion winze is down 421 feet below the 1500 level; bottom in low-grade quartz. The joint northwest drift from the 1800 level of Ward shaft has a total length of 550 feet; face in porphyry. Extracted and sent to the mill in the past week 417 1900-2000 tons of ore from the 930, 1000, 1100, 1150 and 1200 levels. Milled during the week 483 tons. On hand at mill 85 1300-2000 tons; average battery assay $24.65; average car sample assays $28.06.

WARD COMBINATION SHAFT.—The joint Alpha and Exchequer south drift from the north line of Exchequer, 1800 level of Ward shaft, has a total length of 210 feet; face in porphyry. The joint Bullion and Potosi northwest drift, from the 1800 level, has a total length of 550 feet; face in porphyry.

BULLION.—The joint Potosi winze is down 420 feet below the 1500 level; bottom in low-grade quartz. The south drift, 1500 level, is out 555 feet south of north line; face in porphyry. The joint northwest drift from the 1800 level of the Ward shaft has a total length of 550 feet; face in porphyry.

ALPHA.—The joint Exchequer and Alpha south drift from north line of Exchequer, 1800 level of Ward shaft, has a total length of 210 feet; face in porphyry.

EXCHEQUER.—The joint Exchequer and Alpha south drift from north line of Exchequer, 1800 level of Ward shaft, has a total length of 310 feet; face in porphyry.

OCCIDENTAL.—From the stopes on 350, 400 and 450 levels have extracted and milled 179 tons of ore of the average value of $22.60 per ton as per battery samples. The Zadig drift from the Sutro tunnel has been extended 21 feet; total 683 feet.

CON. NEW YORK.—The winze in No. 4 crosscut, 650 level, is down on the slope 25 feet; the whole distance in fair-grade ore. The west crosscut, 850 level, is in 17 feet; face in clay and porphyry.

SILVER HILL.—The raise in the south drift, 800 feet from the Justice shaft, 490 level, is up 25 feet; top in hard porphyry.

Globe District.

SULLIVAN.—Belmont *Courier*, June 30: The Downey brothers are working the Sullivan mine, and are taking out considerable rich gold and silver ore, which they are storing away, hoping for a rise in silver. Mr. Kelly is also taking out rich gold ore from his mines in the same district.

Mammoth District.

DOING WELL. — Belmont *Courier*, June 30: Bart. Croce, in the old Mammoth district, is doing well, occasionally meeting bunches of rich ore worth from $1 to $2 per pound.

Lodi District.

SHIPMENT.—Belmont *Courier*, June 30: No work is being done at present in the Lodi Mines, but a heavy shipment of ore left the mines for Carlin a short time ago.

Union District.

ENCOURAGING.—Belmont *Courier*, June 30: In Union district the outlook is encouraging. The mines of the Indianapolis Company are being worked at present by tributers, who are doing fairly. Al. Phillips and partner, while at work in the Indianapolis mine, encountered a cross ledge, supposed to be the North Star, which gives from 8 to 12 inches of good shipping ore. P. Merten and J. McGeary are also doing well on the Emigrant mine, and have about 19 tons ready to ship. Frank Bradley has also a fine lot of ore ready to ship from his mines, principally from the Cleveland. All who can afford to do so are holding their ore back, hoping for a rise in silver. John Centras has rigged up a jigger, and is cleaning up his ore dumps. He seems well pleased with the results. His mines are principally gold-bearing and are looking well.

Tuscarora District.

NAVAJO.—*Times-Review*, July 1: North intermediate drift above the 350 level has been extended 8 feet.

BALLA ISLA.—South drift from the north line crosscut, 250 level, extended 12 feet; the face shows some improvement. No. 1 crosscut, same level, extended 4 feet and a drift started south on the vein cut last week, which is yielding some very fine ore.

NORTH BALLE ISLE.—West crosscut from No. 1 north drift, 350 level, extended 16 feet; rock very hard, but breaks well. South intermediate drift above the south 500 level extended 6 feet.

NEVADA QUEEN.—Second level—Work in south drift from No. 3 east crosscut has been suspended; face in porphyry. Stopes have been started west side of south drift and are yielding some good ore. Stopes above the level have not changed since last report. Stopes from No. 1 chute, east vein, show a little improvement in the grade of ore; continue about the same width. Hoisted for the week 54 cars first-class, assays return $287 per ton, and 471 cars sent to concentrator, battery assay $24.62 per ton. Third level—The stopes show 1½ to 2 feet of ore, average assays from which return $125 per ton. Received $35,000 from Union Mill Company on account of ore shipped.

New Arabia District.

ACTIVE.—Nevada *State Journal*, July 2: There is some activity in mines. Forty men are employed at the Arabia mines. Ore is being taken out by the owners, Stone, Scidmore & Co., and shipped to Oakland, where they have smeling furnaces.

OREGON.

THE CARPENTER.—*Bedrock Democrat*, July 2: S. F. Fore is in the city from the Carpenter hill, where he has been engaged for several months past running a tunnel to tap the ledge, the property of the Carpenter Hill Mining Company. The gentleman stated that the tunnel is now in 240 feet and that they are within 20 feet of the ledge. It is presumed that this is the mother lode and the ledge which has fed the rich placers below. We refer to the Carpenter diggings which have been successfully worked for many years and have given up thousands of dollars.

ANOTHER BAYAN MILL.—The recent visit of Mr. Geo. W. Robinson, of Detroit, Mich., a heavy stockholder in the Robinson mine, situated in the Elkhorn district, to this city resulted in the company deciding to put a mill on the property. The mine has been steadily developed for several months past, and a splendid showing is made. The mill will be a Bryan plant, the same as has been most successfully used at the Robbins-Elkhorn. The mill will be ordered at once and no time will be lost in getting everything in readiness for the reduction of the ore.

UTAH.

IN THAYNES' CANYON.—Park *Record*, June 2: The indications for a very active season up Thaynes' canyon are very flattering indeed. Rosscamp and Glenn have overtures from capital to take hold of their discovery and develop it. The Comstock will undoubtedly begin extensive operations; the Jupiter is already at work, with excellent prospects of uncovering a body of fine shipping ore; the Morning Star is being developed under a new management, while the Silver Key, Apex and Crescent complete a picture of activity that does one good to contemplate. Other parts of this great district are just as active, and there is no doubt that the season will prove the most active and largest in production in the history of the camp.

OAK AND BULLION.—The Crescent company shipped this week 499,500 pounds of concentrates. The Ontario mill shipped this week 34 bars of bullion, containing 19,292.77 fine ounces of silver. The Marsac mill shipped 6 bars of bullion this week, containing 7,093 fine ounces of silver. Following are the ore shipments from the Mackintosh sampler for the present week: Silver King concentrates, 118,710 pounds; Woodside concentrates, 42,040; Wasatch lease ore, 16,350; Silver Key lease, 24,090; Daly, 293,530; Anchor concentrates, 531,850; May Flower ore, 754,500; Silver King, 61, 260; Ontario, 334,590; total from the camp, 2,939,320 pounds.

WASHINGTON.

SWAUK MINES. — Cor. Ellensburgh *Capital*: Everything in camp is moving along prosperously, every claim is paying and every mine-owner is perfectly satisfied with his prospects. E. D. Ainsworth, superintendent of the Spokane Hydraulic Co., has purchased the Green Tree Co's. claim and is now running two giants night and day with good management and the right kind of machinery and tools to work with. This prospect will be a mint for the proprietors. Their last cleaning up for a 20 days' run was nearly 45 ounces. B. C. Pitcher, owner of the Black claim, has made two splendid clean-ups, already this season. From the second run he sold to L. R. Grimes of Ellensburgh 25 ounces of nuggets for the World's Fair collected from Kittitas county and has contracted all the coarse gold he may get for the same purpose. C. A. Deilig, on the old Pike claim has nearly finished clearing his bed rock, and last week he picked out of one crevice one $50 piece, and one $31 and several smaller pieces, besides the fine gold. Gus Nelson is doing splendidly on his Williams creek placer. He has several pocket pieces, weighing from $5 up to $31. C. E. H. Bigney has struck it rich in his Williams creek placer. He has been getting from one to four ounces in the pan and the best quality of gold ever found in the camp. It will coin $16.50 or $17 per ounce. Tweet, Johnson & York are running their arrastre day and night. J. T. Brien has discovered the extension of the Virden ledge with very flattering prospects. The Buck Horn mine, quartz, owned by Ford, Smith & Kanp, is the talk of the camp. Billy Kanp, the manager, has struck a fine body of quartz that prospects high in free gold. This ledge is about seven feet wide, with slate and porphyry walls and a great deal of the rock shows free gold. The talc clay and decomposed quartz prospects from 5 to 25 cents per pan. The owners are now negotiating for a mill and will probably have one in operation within the next 60 days.

MARKET REPORTS.

Local Markets.

SAN FRANCISCO, July 7, 1892.

General trade was interrupted the past week by the usual holidays attending an observance of the Fourth of July. On Tuesday business was quite fair and has since shown a decided increase in the volume of goods sent out. While some of the merchants in different branches of trade say that business is light, yet the large majority feel well satisfied, but they would unquestionably feel much better pleased if the margin of profit was not so small. Close competition with the East and other distributing cities on this coast, has reduced profits to such a low percentage that merchants have to do a very large business to make a fair rate of interest on capital invested and risks run. Manufacturers can be classed in the same line. This year iron workers have, so we are informed, executed more orders than for a half decade past. The lower prices at which they have been able to buy raw material has contributed no little in promoting better times with them. It is claimed that iron workers, as a rule, have orders in hand which will keep them busy for some time to come. If the silver bill should pass the lower House of Congress and be signed by President Harrison, the mining industry (gold, silver, copper and lead), would be revived, and with it coming actively to the front, our iron workers would have considerably more to do, for there would be a large increased call for machinery, tools, etc. The local money market is reported easy with less trouble met in receiving accommodations. The regular semiannually, quarterly and monthly disbursements are being made and by the middle of the month they will assume their largest proportions. There is more inquiry for funds with which to move the crops, but, as yet, very little has been engaged. The crops are turning out larger and better in quality than had been claimed, which will require more money than was expected to handle them properly. It begins to look as if the mining share market is being worked into a favorable position for an active bull campaign. If we should have a mining share deal, new life will be instilled into all industries, when money will find ready employment at good rates of interest.

On last Friday, the United States Senate passed Stewart's bill remonetizing silver, with an amendment attached providing for the coining of the silver hullion now held by the Mint. The bill is before the House for action, and at this writing, all information warrants the assertion that it will be passed by a good majority. It is quite generally claimed that the President will sign the bill. This opinion is founded on the belief that President Harrison seeks to carry out the wishes of the majority of the citizens of the United States, and there can be no doubt but what they wish silver remonetized. Fully one-third of all Americans are firm believers in bimetallism, while all of one-half wish it as an experiment, and if it proves good continue the law, but if it is had for the country at large, then repeal it.

From the latest official reports of the United States Bureau of Statistics of the total exports and imports of merchandise, silver and gold, for the first 12 months ending May 31st, the following tables are separately compiled, which will be found useful for reference as well as for careful study.

MERCHANDISE.

	Exports.	Imports.
1892	$1,022,961,528	$828,767,858
1891	879,997,426	846,888,913
1890	852,984,905	775,084,658
1889	738,760,514	746,842,707
1888	699,285,727	722,269,312
1887	724,132,585	685,299,322

SILVER.

	Exports.	Imports.
1892	$30,932,962	$18,837,919
1891	22,017,241	18,851,455
1890	37,090,513	21,574,419
1889	35,943,068	18,196,221
1888	27,324,260	15,470,177
1887	26,403,001	17,453,900

GOLD.

	Exports.	Imports:
1892	$48,882,061	$49,477,446
1891	74,271,910	18,335,491
1890	31,673,999	13,216,177
1889	44,975,687	9,919,363
1888	15,842,274	44,146,400
1887	17,461,014	42,668,039

The above tables show that while our exports of merchandise and silver have been increasing at an enormous rate, since 1888, both the import and export of gold has increased. An analysis of the tables shows that while for the year ending May 31, 1888, we imported $13,113,225 more merchandise than we exported of merchandise and silver, yet in the same time we imported $28,304,126 more gold than we exported, making a total of $41,417,351 more of merchandise, silver and gold imported than were exported. These facts show that there was such a flow of foreign capital to this country that it more than neutralized the adverse balance of trade against us. That was the year when an enormous amount of American railroad bonds were floated in Europe—a much larger amount than was ever before or has since been placed abroad. The aggregate capitalization in capital stock, funded and floating debts of the railroads in the United States was increased in the calendar year 1888 nearly $700,000,000—from a total of $8,673,187,000 in 1887 to $9,369,290,000 at the end of 1888. But from that time the tide of foreign capital began to ebb. In 1889 the increase of the capitalization of the railroads was only $311,642,000 to an aggregate of $9,680,932,000 at the end of 1889. Since then the return movement of foreign capital has also been increasing so that exchange has been running more and more against us. In the twelve months ending with May 31, 1888, we received $41,417,351 more of merchandise, gold and silver than we exported, yet we did, in the corresponding time ending May 31, 1892, export $205,693,328 more than we received. The letter shows unmistakably that we have been paying back part of the borrowed foreign capital, as well as the interest on that not paid, and this "paying back" has been made by the sale of American securities in the New York market for European account.

The above shows that the flow of gold from the United States was not so much from a fear of silver legislation as it was to pay for American securities bought for profitable investment.

SILVER.—Immediately following the passing by the United States Senate of the Stewart silver bill, prices abroad and at home advanced, only to fall back on yesterday. What the decline was based on it is hard to say, for all present advices indicate that the House of Representatives will pass the bill as it came from the Senate, and that it will be approved by the President is accepted as a foregone conclusion. The amendment to the bill requiring that the hullion now in the mints shall be coined, is good, for the piling up of hullion has been a menace to the market by causing European nations to look with distrust on the movement in this country to purchase the output of American mines. With this removed, more confidence will be felt, and the hoarding of silver not be attended with fears that the markets might break at times by the United States unloading hullion. European advices indicate that Italy and Austria will soon have to commence buying silver. The demand from India is not as large as was looked for.

MEXICAN DOLLARS—The market is barely steady at 70½c@71c.

BORAX—Exports the past week aggregate 1520 to New York. The market is fairly firm.

QUICKSILVER—Receipts aggregate 346 flasks and the exports by sea 140 flasks to Mexico. The market remains steady at quotations.

LIME—Receipts the past week aggregate 1778 hbls. The demand both local and for export, is fair for the season. The range of value is $1 40 to $1 50 per barrel.

ANTIMONY—The market is fairly steady at current quotations. The New York market is reported firm but quiet.

TIN.—The market is easy. The demand is slower for pig. Eastern advices report that the market has every indication of sagging to still lower prices, probably to again trap short sellers. There is a feeling of caution among outsiders.

LEAD.—The market is strong and in sellers' favor. New York advices are quite bullish owing to stronger holding and higher figures in the St. Louis market.

COPPER. — The market has been gradually sinking. New York mail advices are not of an encouraging character for holders. Under date of June 17, at Liverpool, James Lewis & Son says: "The nine principal mining companies in the United States have agreed among themselves that their production shall, for the year commencing July 1 next, be 100,893 tons, against 90,625 tons in 1891. The production not included in this agreement amounted to 36,160 tons in 1891, when the total was 226,785 tons. European mining companies, producing about one-half of the total production, have agreed to place a limit on their output in some cases reducing by 5 per cent that of the year 1891, while in others they have been allowed an increase amounting in one important instance to 10 per cent. Chilian producers are not included in the agreement, their production last year having suffered considerably from the war. We may, therefore, look for some increase from this source.

PIG IRON—Imports the past week aggregate 420 tons from New York. The market is fairly firm at quotations. Eastern mail advices are conflicting. A further reduction was made in prices the past week. *Iron Age* says: "The large Western Agricultural Implement makers are arranging for a 12 months' supply of raw materials. They have been trying to buy foundry iron for a year's delivery at present prices, but have found some Southern makers unwilling to commit themselves beyond this year"

There was imported the past week 701 tons of steel Bloom from Cardiff.

COAL—Imports the past week aggregate as follows: Sydney, 3865 tons; Nanaimo, 2474. Newcastle, N. S. W., 11,694; Seattle, 5875; Departure Bay, 4377; New York, 203. Total, 28,488 tons. The market does not show any material change in quotations. The consumption of straw is enlarging, but the supply on spot and to arrive is ample for all nearby wants.

COKE—Imports the past week aggregate 2142 tons from Cardiff. The market is steady at current quotations.

Mining Share Market.

SAN FRANCISCO, July 7, 1892.

A three-day holiday appears to have enthused the manipulators, or else they studied with good effect the pyrotechnic displays on the Fourth wherein sky rockets predominated, for on Tuesday afternoon and Wednesday morning the Belcher shares shot up like a sky rocket only to fall back equally as fast. The upmove instilled new life along the line of which the better informed of outside operators took advantage and sold believing that there is no positive signs, as yet, that the manipulators intend making a deal. Published reports of the work being done in the mines, point to time killing, for what purpose each operator must be the judge. There is still being done a large amount of very important secret work, but the share market and other conditions do not appear to warrant the making of it public. When the time does arrive all the secret strikes and developments which have been done will be done over again and the strike be made to appear as if they are new and made accidentally. While the work on the 400-level in Belcher warrants better prices than now rule for the shares, yet it does not justify outside shareholders in looking for much higher prices; but when the management gets ready to show up one or more of the lower levels where good to high grade ore is known to exist, then we can look for quite an advance in the shares. Before that time arrives the reported controller (D. O. Mills) of that and other Gold Hill mines may find it necessary to have his dummy directors of several mines levying more assessments.

It is said by persons who should know that inside secrets of the past management of several mines will be made public in due course of time, and when they are public property persons who now pose in society for all that wealth brings will be electrified by the exposures and the public made to see in its true light things which are worse than was uncovered in the Hale & Norcross suit. It is to be hoped that with these exposures, Comstock mine managers will purge themselves so far as to be at least half way honest.

Even with this concession to honesty, a big share market can be promoted. The mines were probably never before in such favorable working condition as they are at present.

Shares in the mines of outside mining districts continue flat, stale and unprofitable. It would seem as if the manipulators have had ample time to concentrate the shares so as to make a deal. Several of the mines in each district can be made to pay dividends.

Some mining share operators are surprised at an upmove in the shares in the Gold Hill mines, for heretofore when D. O. Mills visited this Coast the market went down.

Consolidated Virginia's monthly statement of hullion productions shows that the ore is running largely to gold. The question naturally presents itself: Does not the ore come from the West or Red Lode?

Mining Companies' Financial Standing.

Eastern Metal Markets.

NEW YORK, July 6.—The following are the closing prices the past week:

	Silver in London.	Silver in New York.	Copper.	Lead.	Tin.
Thursday	40½	87⅝	11 50	4 17½	21 10
Friday	40 3-18	87⅝	11 50	4 17½	21 10
Saturday	40½	88	....	....	....
Monday	....	....	....	....	....
Tuesday	40½	87⅝	11 40	4 17½	21 10
Wednesday	39 13-16	86⅞	11 40	4 22½	21 00

Quicksilver is steady at the last quoted advance. Lead is advancing under an improved demand and a strong holding. Tin is lower and easy. Copper continues in buyer's favor. Pig iron continues to recede in price.

THE new building for mechanical and electrical engineering at the University of California is to cost $65,000.

The Explorers' and Assayers Companion.

A Third Edition of selected portions of the "Explorers', Miners', and Metallurgists' Companion."

A practical exposition of the various departments of Geology, Exploration, Mining, Engineering, Assaying, and Metallurgy.

Price, $6.00 post-paid. Sold by DEWEY PUBLISHING CO., Publishers, 220 Market St., San Francisco.

BY J. S. PHILLIPS, M. E.

The work is divided into four parts—Rocks, Veins, Testing and Assaying. The geological chapters are intended to give miners a practical idea of the various formations. The chapters on mineral veins are derived from long observation, and the section on exploration has been carefully considered. All that relates to discrimination and assay of minerals has been kept as free from ormulæ as possible. The work is written for practical men, and all the explanations and descriptions are clear and to the point. It is so prepared that it is useful to uneducated men as well as scientists.

Postmasters are requested to be sure and notify us when this paper is not taken from their office. If not stopped promptly (through oversight or other mishaps) do us the favor to write again.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR THE WEEK ENDING JUNE 28, 1892.

477,982.—SPRING GUN—J. W. Atkinson, Milpitas, Cal.

477,735. — MAKING WHITE PIGMENTS — John Blair, Spokane, Wash.

478,047.—CUT-OFF VALVE GEAR—H. T. Clarke, Portland, Or.

477,739.—DOOR HANGER—A. G. Dahmer, Alameda, Cal.

477,934.—ORE CONCENTRATOR—H. F. Hicks, Ashland, Or.

477,959.—TREE PROP—T. J. Hubbell, San Bernardino. Cal.

477,946.—GUN—Livingston & Starrett, S. F.

477,952. — GRAPE PICKER — Moore & Jory, Stockton, Cal.

477,956.—LATH BOLTER—J H. Peterson, Portland, Or.

477,912.—REVERSIBLE PLOW.—A. Pirch, Los Angeles, Cal.

478,024 —PIPE-LAYING DEVICE—E. H. Rose, Colton, Cal.

477,705.—BICYCLE STAND—M. J. Russell, Los Angeles, Cal.

477,963. — LOCKING MAIL POUCHES — A. J. Shaw, Spokane, Wash.

478,029.—ELEVATOR HATCH—C. P. Stanford, S. F.

477,718.—ELEVATED TRAMWAY—W. P. Walling, Santa Monica Cal.

The following brief list by telegraph, for July 5, will appear more complete on receipt of mail advices.

San Francisco—Theodore F. Burkhard, whipsocket and reinholder; Silas Harris, railway chair; Samuel Rodgers, explosive compound; Charles E Blake, Sr., dental forceps; Olaf Eastman, water filter. Sacramento—John F. Linthgum, machine for wrapping papers. Vallejo — Lewis H. Fowler, fire ladder. Berkeley—James Hewitt, tripod. San Bernardino—Lyman N. Bedford, time lock.

Oregon—George L. Wilcox; H F. Hallenbeek and T. Wandell, all of Albany, cloth-measuring machine.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

CAN-HEADING MACHINE.—Milton A. Wheatou, S. F. No. 477,584. Dated June 21, 1892. This machine is new in its general plan and in its details of construction and operation. It would be difficult to describe in detail without the aid of elaborate engravings. There are certain chutes which are kept filled with can-heads and can-bodies. These stand in columns resting upon one another, except the lower ones, which will rest upon such part of the jaws of the machine as happen to be under them. The machine is set in motion, and, as it revolves, the jaws will pass under the chutes, and each set of jaws will receive the lowest can-body and also the lowest can-head that is in each one of the can-head chutes. When the can comes out of the machine, the head is fixed to it.

CONCRETE MIXER.—George F. and Harry N. Gray, S. F. No. 477,361. Dated June 21, 1892. This apparatus for mixing the ingredients of concrete consists in a vertical box or casing, into the upper end of which the ingredients are deposited and from the lower end of which the mixed material is received, said box or casing containing a vertical series of separated and oppositely inclined shelves or platforms, whereby material is carried by gravity through a tortuous course, falling from one shelf or platform to the other, whereby it is thoroughly mixed. It also consists, in connection with said box or casing, of a suitably arranged water distributor adapted to direct water upon the material as it falls from shelf to shelf. The whole thing is adapted to be mounted upon and lie between the sides of a mold for a retaining-wall, and can be moved back and forth therein to deposit the mixed material in said mold throughout its length. The object is to provide an easily movable mixer adapted to operate in such position as to deposit the mixed material, during the course of its movement, throughout the length of the work to be performed—such, for example, as the construction of a retaining-wall.

SPRING-GUN.—James W. Atkinson, Milpitas, Santa Clara Co., No. 477,982, Dated June 28, 1892. The invention relates to that class of guns for killing burrowing animals, such as gophers, in which a forwardly-projecting tripod is employed to actuate the firing mechanism. The objects of the invention are to provide for convenience in loading and absolute safety in handling and setting the firing mechanism and handling the gun while adjusting it in position.

GUN.—Andrew W. Livingston and Stephen E. Starrett, S. F. No. 477,946 Dated June 28, 1892. The object of this invention is to construct a gun in which the inertia of the projectile is first overcome by a moderate charge of an explosive or of some propelling gas or vapor under pressure and after the inertia has been thus overcome to apply the force of the final propelling charge to give the projectile its final impulse.

ELEVATOR HATCH.—Charles P. Stanford, S. F. No. 478,029, Dated June 28, 1892. The invention relates to certain improvements in automatically-operated elevator-hatches or doors such as are employed to close the openings in the floors of buildings through which elevator cages pass or which may be used at any desired intervals to cut off and close the elevator-well. The present invention is an improvement on a patent issued to the same inventor, June 8, 1890.

Complimentary Samples.

Persons receiving this paper marked, are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, $3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber please show the paper to others.

Assessment Notices.

GOULD & CURRY SILVER MINING COMPANY. Location of principal place of business, San Francisco, California; location of works, Virginia Storey County, Nevada.

Notice is hereby given that at a meeting of the Board of Trustees, held on the seventh (7th) day of June, 1892, an assessment (No. 69) of Twenty-five (25) Cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, Room 69 Nevada Block, No. 309 Montgomery Street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the twelfth (12th) day of July, 1892, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 4th day of August, 1892, to pay the delinquent assessment together with costs of advertising and expenses of sale.

By order of the Board of Trustees

ALFRED K. DURBROW, Secretary.

Office—Room No 69 Nevada Block, No. 309 Montgomery Street, San Francisco, California.

THE BUTTE KING MINING COMPANY. LOCATION of principal place of business, San Francisco, Cal. Location of works, Butte County, Cal.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 4th day of June, 1892, an assessment (No. 4) of five cents per share, was levied upon the Capital Stock of the Corporation, payable immediately in U. S. Gold Coin, to the Secretary, at the office of the Company, 723 Market St., San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the 11th day of July, 1892, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on Tuesday, the 2d day of August, 1892, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors,

W. O. LEWIS, Secretary.

Office, 723 Market St., San Francisco, Cal.

TERIKOFF G. M. AND M. COMPANY. LOCATION of principal place of business, San Francisco, Cal. Location of works, Amador County, Cal.

Notice is hereby given that at a meeting of the Board of Directors, held on the 31st day of May, 1892, an assessment (No. 8) of one cent per share was levied upon the Capital Stock of the Corporation, payable immediately in U. S. Gold Coin, to the Secretary, at the office of the Company, 308 Pine St., San Francisco, Cal.

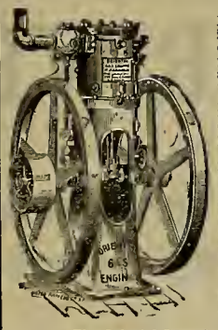
Any stock upon which this assessment shall remain unpaid on the 6th day of July, 1892, will be delinquent, and advertised for sale at public auction, and, unless payment is made before, will be sold on Friday, the 29th day of July, 1892, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

W. J. GURNETT, Secretary.

Office, 308 Pine St., San Francisco, Cal.

THE ORIENTAL GAS ENGINE



IS THE BEST, because it combines simplicity of construction with power and economy in space. It can be run with natural or manufactured gas or gasoline at a cost of 20 to 25 cents per horse power per day.

It can be used for pumping purposes, as well as for all purposes where a perfect engine is required, with the advantage of lessening the risk of explosions. No licensed engineer at a high salary needed to operate it.

Send for circulars and prices if a good safe engine is what you need.

The Oriental Launch is Perfection.

Books on Working Ores.

BY GUIDO KUSTEL, M. E.

ROASTING OF GOLD AND SILVER ORES (Second Edition) and the Extraction of their Respective Metals without Quicksilver. By GUIDO KUSTEL, M. E. 1880.

This rare book on the treatment of gold and silver ore without quicksilver is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes an apparatus employed in this country and in Europe, and the why and wherefore. It contains 156 pages, embracing illustrations of furnaces, supplements and working apparatus. This a work of great merit, by an author whose reputation is unsurpassed in his specialty PRICE, $3, coin, postage free. Sold by DEWEY PUBLISHING CO., Publishers, 220 Market St., San Francisco

BY C. H. AARON.

AARON'S LEACHING GOLD AND SILVER ORES, the most complete hand-book on the subject extant; 164 pages octavo. Illustrated by 12 lithographic engravings and four wood cuts. Fully indexed. Plainly written for practical men. In cloth, $3. Sold by DEWEY PUBLISHING CO., 220 Market St., San Francisco.

AMERICAN MINING AND STOCK CODE

"KELLOGRAPH."

Indispensable to the Mining Professions and Useful in all Business Transactions.

A Complete System of Transmitting Telegraphic Messages by Code Cipher Words in a Legible, Secret and Economic Manner.

OVER 35,000 WORDS AND SENTENCES

Subject to transmission under infinite complication by the use of over 70,000 code words.

No danger of publicity in telegraphing matters concerning operation or sale of mining property. The work strictly alphabetical and classified. The handiest work ever published for mining operators.

PRICE, $5. Forwarded postpaid on receipt of price by

P. O. Address, South Riverside, San Bernardino Co., Cal.
CAJALCO, Dec. 18, 1891.

MESSRS. ADAMS & CARTER, 132 Market Street, San Francisco, Cal.—GENTLEMEN: After a continuous trial of different concentrators comprising the Frue Vanner, the "Holland," "Paradox," "Triumph" and the "Woodbury" concentrators), extending over several months, we find that we prefer the Frue Vanner, as it is easier of adjustment, runs smoother, has less wear and tear, and—having a positive travel—gives less trouble than the other more complicated and ever changing machines now in use here. The Frue Vanner not only saves a cleaner concentrate, but has less loss in the tailings, and is in several ways preferable to the other concentrators here.

I am, my Dear Sirs, Yours faithfully,
S. HARRIS, Manager.

The "Comet" Rock-Crushers.

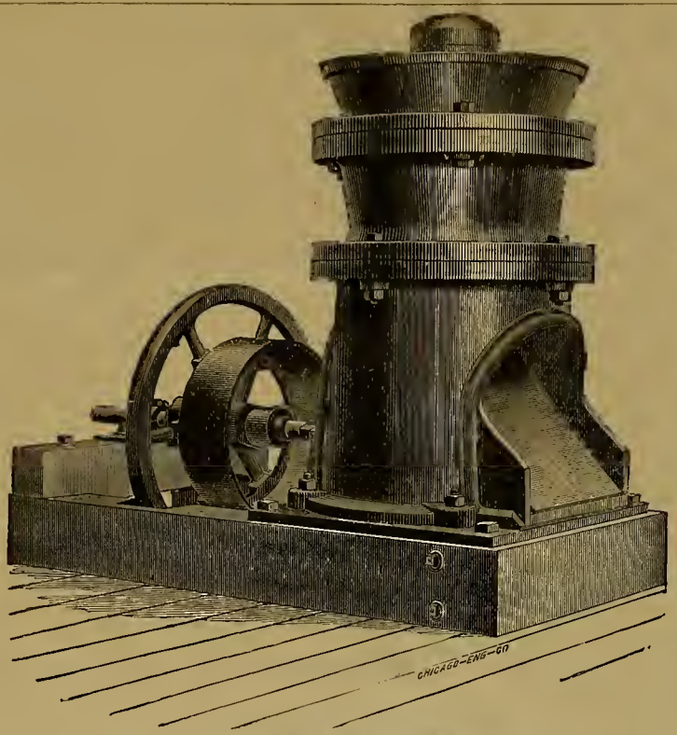
Many forms of rock and ore crushers or breakers have been devised, and among them are several which will perform their requirements of work, are substantial in construction, compact in design and of large capacities in practical service.

In this connection we take occasion to present two cuts of the "Comet" rock crusher, one showing its form and design, the other illustrating, in a sectional view. its plan of placing in position and its method of operation. Referring to the sectional view it will be noted that A designates the crusher proper, firmly placed upon a substantial frame of wood, from which the crushed material passes over the descending inclination of a chute into the revolving screen C, which is provided with perforated screens or wire cloth having such sizes of perforations or meshes as may be required for the discharge of the material in fragments of suitable dimensions, which fall through the hoppers or spouts D and E into the cars G G below. Such material as may not have been broken sufficiently small to pass through the perforations of the revolving screen descends through the spout F into the elevator B, whence it is conveyed by a series of buckets to the crusher for further disintegration.

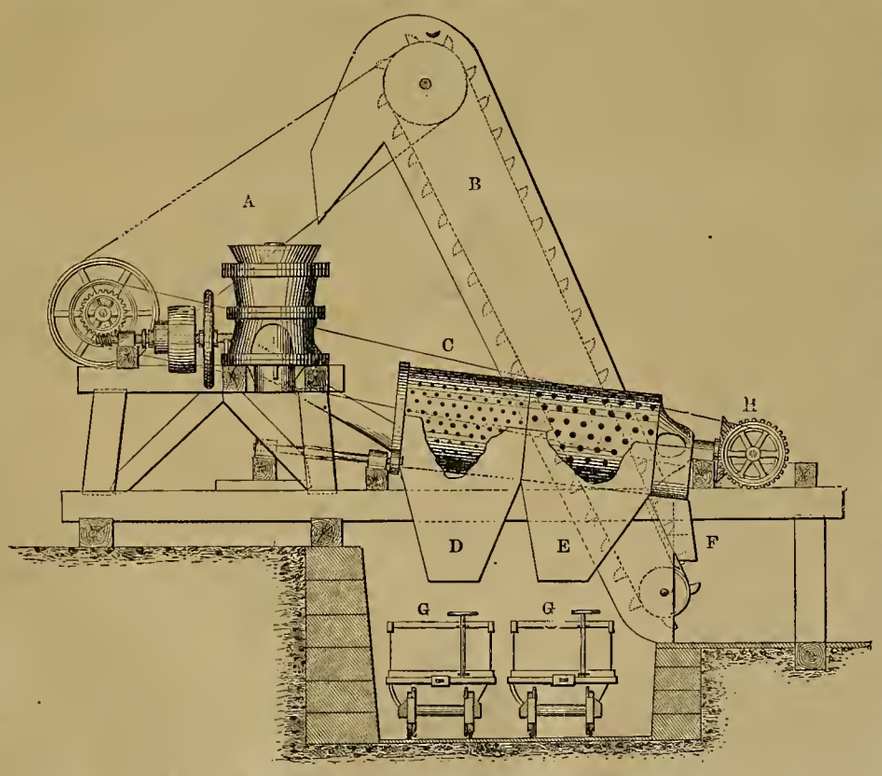
These crushers have been specially designed for and are particularly adapted to crushing railway ballast and street macadam, but are constructed of sufficient strength to crush also with ease ores, granite, phosphate, corundum, concrete, etc., and have been subjected to the severest possible tests, in prearranged trials for that purpose, and have successfully withstood the ordeal.

The exceedingly large capacities of these crushers is attributable to their great receiving capacities and easy motion, without perceptible concussion or vibration. In instance of this, a car of rock can be dumped bodily into the hopper of one without producing any change in the operation of crushing. In testing a No. C crusher, having an opening of 8½ by 17 inches, working upon an exceedingly tough character of rock, it was found that its feeding capacity exceeded the combined labor of three men to feed it, "fire flying all the while," as they said, putting through eight yards of this tough rock in 20 minutes, or say an average of 16 yards per hour, including all delays, stoppages, etc. In a test of a crusher, No. E, having an opening of 12 by 24 inches, its consumption of rock was one ton per minute during the period of the trial.

In the absence of a cut giving a sectional view of the interior arrangement of the several parts of the crushing devices adopted in this form of crusher, we can only outline generally the principles which are involved in the operation of these machines. The axis of the upright spindle is not coincident with the main axis of the machine or bevel wheel, but intersects it in a journal at the top, while the lower end is from one-quarter to three-quarters of an inch out of center. This arrangement produces a gyrating motion at the bottom of the spindle, the top of the journal being practically stationary, except in the slight motion due to the angularity, which is very small, and is compensated for by an oscillating box. The spindle, with its fixed crusher-head, is not fastened into the bevel wheel, but is free to revolve in it.



THE COMET ROCK-CRUSHER.



ROCK CRUSHING PLANT WITH ELEVATOR AND SCREEN.

Crushing is caused by the moving of the crusher-head to and from levers, the same as in a "Blake" or other similar style of crusher with reciprocating jaw motion, and, as the entire space around the head is filled with rock, the crusher is doing duty at every point in revolution of the pulleys and gears. By reason of this, there can be neither shock nor jar, and further, there is no grinding action, as the head does not turn while crushing, although free to do so when not crushing. The crushed rock drops into the inclined chute and thence immediately slides out.

The Joshua Hendy Machine Works, of No. 51 Fremont street, this city, have been constituted the agents for the sale of these "Comet" crushers in the Pacific States, and their representatives can furnish fuller and more explicit explanations of the interior workings of these crushers than are outlined above.

It is deeemed pertinent to state that one of these crushers, a No. C, having an opening of 8½ by 17 inches, has been placed in operation by Mr. W. J. Holmes in his quarry situated on the corner of Clipper and Douglas streets, between Twenty-fifth and Twenty-sixth streets, near the terminus of the Castro street cable railway line, where it can be seen and examined in its thoroughly successful workings and output of macadam for street use and concrete material for foundation, paving and other purposes.

There will also be found at this quarry, under the management of Mr. Holmes, an admirably arranged automatic and economic plant for an almost unlimited production of crushed rock for the many uses to which such material may be necessary.

THE City Council has granted two franchises to build and operate electric railways in the city of Phœnix, A. T. One was granted to men representing San Francisco capital and the other to Lem Harris of Denver. They are compelled to begin construction in six months.

THE Albany Gold Mining Co. has filed articles of incorporation. Its capital stock is $1,000,000. The directors are: F. E. Luty, Sylvester Gardner, T. E. Jewell, Jno. Henderson and F. C. Mosebach.

IT IS possible that another warship will be built on the Pacific coast. The $4,000,000 battle-ship provided for by the Naval Appropriation bill will likely be built by Scott, as it is understood that the Cramps will be in better condition to take the contract for the other vessel—the armored cruiser. The new battle-ship is to be the peer of any in the world—a triple-screw ship, maintaining a higher rate of speed than now attained by vessels of that class.

The Troubles at Cœur d'Alene.

There has been more or less difficulty at Cœur d'Alene, Idaho, for a long time between the mine-owners and the Miners' Union of Cœur d'Alene. This organization comprises the unions of Wardner, Gem, Burke and Mullan districts. Over a year ago, when the mines were working, everybody got $3.50 per day. The mines were finally shut down owing to excessive rates charged by the railroad for taking the ore to the smelter. The mines were to start in April, and then the wages of shovelers, carmen and other surface laborers were reduced to $3 and their time of work increased. The men refused to work on this basis and miners were brought from California and elsewhere to fill their places in some of the mines.

On Monday of this week the strained situation culminated in a fight at the Gem and Frisco mines, at the town of Gem, between union and nonunion miners. Five men were killed and 16 wounded. The Frisco mill was blown up during the fight and is a complete wreck.

The Governor was called upon, and ordered the militia to prepare to go to the scene of the trouble. The miners have destroyed bridges and tracks to prevent the approach of the militia, and the Governor has declared martial law. A number of nonunion men left the mines and went to Old Mission to wait for the boat. Here they were attacked by union miners and 12 of them shot, in the most cowardly manner, while fleeing for safety. The union men have turned over the Bunker Hill and Sullivan property to the sheriff. The whole occurrence is very serious indeed, and the trouble is not yet over.

It will be found if capitalists, who open and work mines, are expected to pay ordinary surface labor the prices they have to pay for skilled underground miners, especially when that rate is $3.50 per day, that there will be fewer mines opened in the future. Very few mines can stand paying such prices for unskilled work. It will further be learned, if people who invest in mining property are to have that property placed at the mercy of their employes in case of disagreement, they will seek other form of investment. Again, if miners' unions find it necessary to carry their point by force of arms; use dynamite to blow up mills and bridges; and shoot down nonunion miners who are unarmed, then miners' unions will not last as long as they might otherwise. Neither mine owners nor the public will stand any such behavior. It is all very well to stand together to keep up wages, but there is reason in all things; and when acts of lawlessness are committed, the unions can no longer expect the public to hold them in any kind of estimation. It is a bad cause which has to resort to such expedients.

The Hydraulic Mining Bill.

Unless there is another "suspension day," and unless on that day the hydraulic mining bill is in better luck than on Thursday of last week, it may be considered as laid on the shelf for this session of Congress. There is still a hope, however, for there is no doubt but two-thirds of those in their seats, the other day, when the test came, favored the bill; but a Texan Congressman objected and made it impossible to put the measure through. The California delegation, without exception, had labored with every Congressman within reach to put down any opposition that might creep up, and on every side assurances of friendship were offered.

When the bill had been read, however, and before any remarks upon it could be made, Bailey of Texas arose and put in his accustomed objection. He demanded a second, which meant that a majority of the whole House must vote in favor of the question in an indirect way before a direct vote upon the bill could be taken. Not enough votes could be mustered to accomplish this, and upon the suggestion of Dockery of Missouri the speaker announced that the bill would go over to the next suspension day as unfinished business. The vote on ordering a second was 132 to 3.

Everything depends upon the humor of the House. If there is a disposition to adjourn sine die as quickly as possible, there will probably be no more suspension days, and in that event the only way to bring the bill before the House would be by special rule, and it is very doubtful if one can be secured. Bailey was not the only objector. While the bill was being read, he held a consultation with Kilgore and Watson, a Farmers' Alliance man from Georgia, and it was quickly seen that they meant mischief. They were soon surrounded by friends of the bill, who urged them not to offer any objection; but prayers and threats alike were without avail. Watson relented, but the two Texans announced their determination to defeat the bill, if possible, and they did so for the present at least. They offered no excuses for their conduct, unless Mr. Bailey's remark that he doubted the constitutionality of the measure can be taken as such.

Bailey has done nothing but object during the whole session, as the records show, being an abridged edition of Holman. It is said that when he entered Congress he asked Culberson what he should do to make himself famous. "Get a fad," said the great Texas lawyer, "and stick to it." He made objection to everything and anything under all circumstances. His fad worked, and he has stuck to it. Had he not done so, the House might have passed the mining bill without opposition.

Mr. Caminetti said that he had repeatedly offered to explain the bill to Mr. Bailey and others, but that they said it was quite unnecessary. "It is your bill and we will help you," some had assured him. Republicans voted for the bill with the full knowledge that the fact of its passage would be used as campaign ammunition by Caminetti and the Democrats this fall.

Mr. Luttrell, who was on the floor of the House all day, is still confident that victory will be won before the end of the session. Mr. Caminetti does not appear to be at all downcast at the result. Indeed, as he himself said, he had been warned by the speaker that it would be difficult to get a quorum; but after consultation with a few friends, he decided to bring up the bill anyway, and if it was beaten it could be made to go over as unfinished business, which would be an advantage in itself. The bill has been changed since first introduced. The appropriation carried as it now stands is $10,000.

The National Mining Congress.

The National Mining Congress opened at Helena, Montana, on Tuesday, with C. S. Chase of Nebraska as temporary chairman. He stated that the object of the Congress was to advance the interests of mining and to urge the passage of a free coinage bill in Congress. Governor Toole of Montana made an address of welcome to the delegates, and spoke also on the advantages of free coinage. F. G. Newlands of Nevada spoke in the same strain and of the benefit of the mining States uniting and working together to secure decisive results. On the second day of the session a permanent organization was effected by the election of Francis G. Newlands of Nevada president. On taking his seat, Newlands made a strong silver speech, urging the mining States to put the interests of silver before party interests, and formulating a plan of how party organization could be preserved in each mining State and the people still be able to use their power to advance the free coinage of silver. This could be done by an agreement that the electoral vote of the mining States should be cast for no person as President who would not agree to permit any silver law passed by Congress to become a law. Newlands' view was that all three of the national parties in the mining States should instruct their electors to act independently of the electoral college in the interest of the silver cause rather than in the interest of any candidate. He claimed that, even though the election were thrown into the House the cause of silver would not necessarily be lost if the friends of silver would be active and vigilant. While it is true that the present House was Democratic, most of the Democratic members of the present House represented Southern and Western constituencies, which were overwhelmingly for free coinage. They would be candidates for renomination and election at the coming election, and pledges should be exacted from all such candidates for reelection that they would not, in the event of the election being thrown into the House, vote for any man for the Presidency unless he would give assurance that the executive power would not be against the popular will. While the Mining Congress was in session on Tuesday at Helena, free silver was shelved for the present by the National Congress at Washington.

Congress and the Mining Interests.

Congress has not treated the mining interests of the country very well this week. Free silver was shelved for the session, and the hydraulic mining bill was put off in such a way that it will very probably go over until Congress convenes again.

As to the free silver bill there is no doubt a very strong opposition to it in many quarters, and it will be a difficult job for the mining States to get it passed. Indeed, they have had very hard work to get it as far as they did, but its passage by the Senate last week, revived the hopes of the silver miners, only to be dashed by the action of the House. The subject having become one of political controversy, the miners have been forced to enter the field of politics themselves. The silver leagues throughout the mining regions and the Mining Congress have resolved only to vote for those in favor of free silver, and will desert the two old parties entirely.

As to the hydraulic mining bill, a very hard fight has been made by the California miners. Sufficient votes have been pledged to pass it, but owing to parliamentary practice, under the rules, the objection of a chronic objector stopped the passage of the bill. It has one more chance this session, but a slim one.

However, it is the opinion of many influential men favorable to the bill that it can readily be passed next session, especially since the amount of money asked for has been materially reduced. Meantime certain valley people of this State will meet in convention to throw their influence against the miners. This influence, however, will be much less than it formerly was, since it is seen that these people are narrow-minded and selfish and are pursuing a dog-in-the-manger policy. The miners no longer want to carry on the work as they did in years past, and only ask to be permitted to work these mines where it can be shown that no injury will be done to other interests. They want permission to build dams to restrain the debris, and some of the valley people do not want dams built, and object on general principles to mining being carried on. Their fight is made on prejudice, while the miners have justice and reason on their side.

The Powder Works Explosion.

On the morning of Saturday last, a series of explosions occurred at the Giant Powder works, near West Berkeley, by which the whole plant was entirely destroyed and five men killed. The resultant concussion exceeded in intensity anything of the kind ever experienced in California. The people in San Francisco, Oakland, Berkeley, Saucelito and other cities around the bay were seriously alarmed, the buildings being shaken severely, and quantities of glass being shattered.

The first explosion took place in the nitro-glycerin house, where three white men were manufacturing the substance. When this happened, those about the works fled for safety, and most of them had time to escape before the magazines exploded. The time elapsing between the explosions explains the small loss of life in an accident where many hundred tons of powder were blown up. Some six minutes after the first explosion, in the nitroglycerin house, the contents of the warehouses went off, close together. In these were between 150,000 and 200,000 pounds of giant and Judson powder. These latter explosions occurred close together, and it was these that caused the main damage as far as buildings, etc., were concerned.

The cause of the original accident in the nitroglycerin works is a mystery. The three men were sober, experienced and careful—the best in the business. As to the subsequent explosions there is a further mystery. Even when the nitroglycerin went off the giant powder remained intact, the concussion not affecting it. Six minutes after, however, either by the resultant fire or some other cause, it went off.

Concentrating and Refrigerating Machinery.

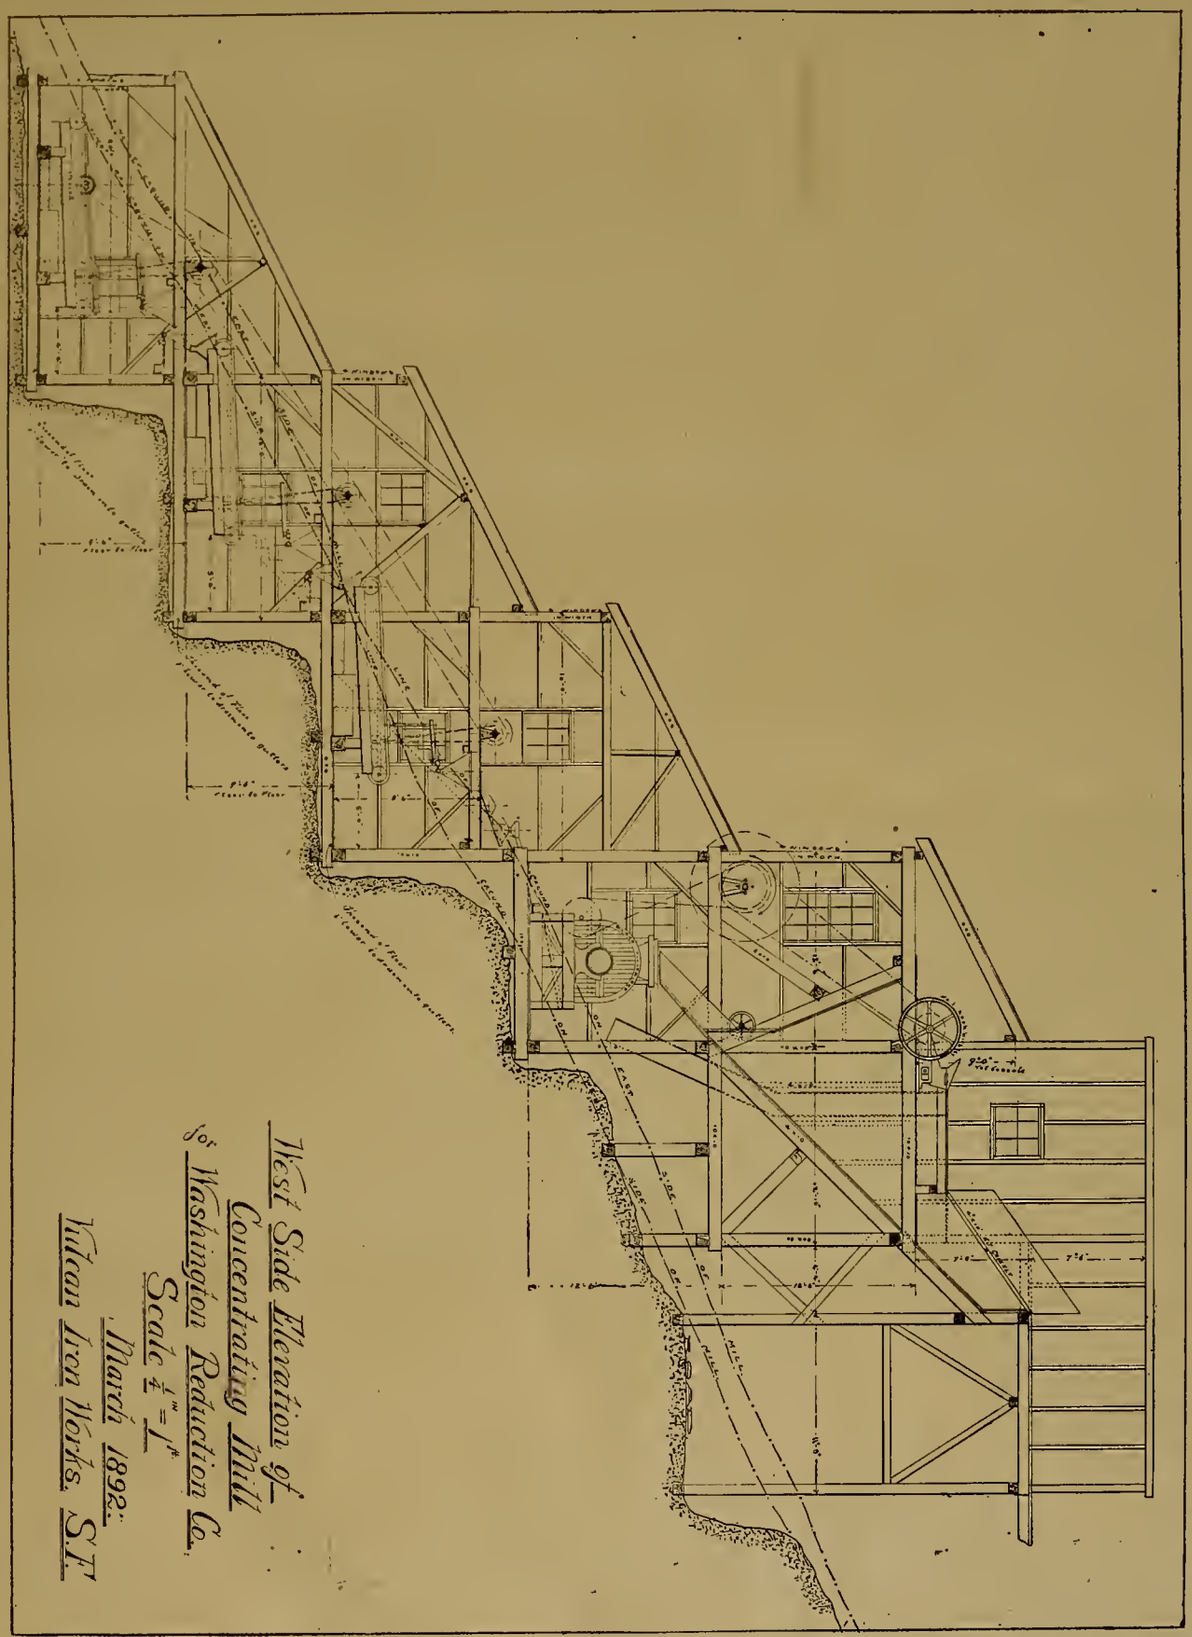
Foundry work is rather dull in this city just at present, and even the largest shops are not working very full-handed. More or less small work is of course going on, but there are few large contracts being carried on, aside from those on Government war-vessels.

A call at the Vulcan Iron Works showed that in some of their specialties, particularly in refrigerating plants, they are finding a good market at distances from this city. They have just completed a ten-ton refrigerating plant for the Doering and Marstrand Brewing Co. of Vancouver, B. C. Another plant of the same nature has been finished for the Williams & Barker brewery, Vancouver. One is also being built for a salmon cannery on the Skeena river, from which place they intend shipping the fish to England.

This is an ammonia machine working on the well-known compression principle which, all things considered, is perhaps the best. Quite a number of these machines built by the Vulcan works are in use in various parts of the country and are all giving satisfaction.

The largest job under way at these works is the new concentrstiog mill being erected at the Ruby mines, Ruby, Washington, belonging to the Washington Mining Co. Mr. Luther Waggoner is supervising the construction of the mill. This mill, a sketch of which is given on this page, has a capacity for handling from 60 to 75 tons of ore every 24 hours, is operated by water power and equipped with the latest and best machinery most suited to the work required. The ore is brought to the mill by a Vulcan wire ropeway, about 6000 feet in length, and dropped on the grizzlies.

The coarse ore goes through two No. 1 Dodge rock breakers and thence to the ore bins, from which the ore is fed by Challenge ore feeders to two No. 1 Dodge pulverizers. This style of crusher was selected by Mr. Waggoner, after careful inspection of the work done by the Dodge pulverizers in various parts of the country, mainly by reason of the small amount of slimes they create, limited power required, freedom from expensive repairs, etc. After leaving the pulverizers the pulp goes over eight Frue vanners and passes through a system of separation, sizing, concentration and reconcentration. Great attention is paid to the sizing of the material in each concentration, the concentrators being regulated to suit the differently sized materials coming from a set of point sizing boxes. Special sampling machines are employed, which are automatic in their action and allow great scope in the division of the sample. The Dodge pulverizers and rock breakers were furnished by the Parke & Lacy Company, for whom these machines are manufactured by the Vulcan Iron Works. All the balance of the machinery in the mill, except the special patented machinery above noted, was furnished and manufactured by the Vulcan Iron Works.



A Silk Mill.

In Petaluma, Sonoma county, is now being constructed the only silk mill west of Chicago. The new factory is now being made entirely of brick and is to be completed by September 15th, the main building being 45x160 feet, containing two stories and 140 windows for plenty of light. The builders, Hedge & Paff, have the contract to complete the structure for $20,394. Carlson & Currier, the manufacturers of San Francisco, have received $12,000 in cash and a block of land from the good people of Petaluma to locate there this promising industry. It was long ago hoped that we would produce enough silk in California to keep a number of factories running, but silk culture on any extended scale has not made much progress here, though all the experiments were apparently successful. The silk which will be used as raw material in the new mill, all comes from China and Japan, and costs $3.40 per pound.

It is a hopeful sign for our future industrial prosperity to see the establishment of factories in the smaller cities of the State. Every one of these started gives employment to a number of residents, who permanently locate their homes. The great need of many of our interior towns is small factories of various kinds, but within the past few years enterprises of this character have become more numerous. All this is an indication of the gradual building up of the State in a good direction.

THE CYANIDE PROCESS is interesting a great many people connected with mining in all parts of the country. We have endeavored to gather as much information on the subject as is available, but there are doubtless some with experience in actusl work or tests who could add much to the stock of information. We should be very glad to hear from any one who has anything to communicate. He may he sure of the attention of a large circle of readers, who may respond with information of further value. The subject has by no means been exhausted, since continued experiment and trial of this process are going on and much of importance may be developed.

A DELEGATE from the Cœur d'Alene Miners' Union is in town to confer with the owners of the Bunker Hill and Sullivan mines, but as the militia has gone up to the region, the present settlement of the question is rather out of the hands of the Union.

Mines of Calaveras County.

From Our Traveling Correspondent.

Part II.

TO THE EDITOR:—Going north from Murphys the mines on Indian creek are the first encountered. The old Calaveras is still idle. The Right Bower, which is the extension west of the Calaveras, has had a tunnel driven 300 feet on the Left Bower vein. The rock became very hard and the superintendent, W. H. Clary Jr., has closed down until power drills can be put in. On the Washington Mr. H. H. Harris, the superintendent, is still hunting for good ore; in the meanwhile the mill is idle.

SHEEP RANCH.

The mine of the place is the old Sheep Ranch mine, W. H. Clary superintendent. The shaft on the Sheep Ranch mine is now down 1200 feet. On the 1000 and 1100 foot levels the ore shoot is 1200 feet long. The vein, like its gold values, constantly varies. The vein will pinch to nothing and swell to three feet with an average of ahout 18 inches. The quartz is irregular in its value hut high in its average. This property is one of the oldest and hest mines in the State; its product to date coming close to $4 000,000. With the showing in depth on the Sheep Ranch mining operators should feel safe in taking hold of the different prospects in this section and fully developing them. Among the most promising prospects are the Chas. Anderson and Tom Smith mines.

THE CHAS. ANDERSON.

G. Rodaseni of Mountain Ranch is owner of the claim. The mine is three miles west of Sheep Ranch and is helieved to be the main ledge of the Sheep Ranch mine. The property is opened hy an 80-foot shaft on a 20-inch vein of ore that mills $10 a ton in free gold. There is alsn a tunnel now in 200 feet on the vein.

THE TOM SMITH MINE.

G. Rodaseni of Mt. Ranch is proprietor of this mine. It is hut half a mile southwest of Sheep Ranch and is thought to he a hranch of the Sheep Ranch mine. The property is opened by a tunnel 300 feet long, which cuts the vein 150 feet deep. The vein—like the Sheep Ranch mine—runs from three inches to three feet. From this mine two crushings have been made that yielded in fine gold $14 a ton from one lot of 90 tons, and $20 a ton from another lot of 57 tons. There is another tunnel started which, when in 400 feet, will cut the vein 600 feet deep.

At El Dorado the Postmaster-General has named the place Mt. Ranch, but the old-timers will have none of it, and El Dorado it is still called.

THE ROSE HILL MINE.

This mine (G. Rodaseni, proprietor) consists of three full locations of 600x1500 feet and a five-acre mill site. The property is ahout two miles west of El Dorado. Mr. Rodaseni has shown his faith in the property by sinking 172 feet, driving a drift from the hillside on the vein 800 feet, and running a level on the veln from the base o. the hill a distance of 1000 feet. In the upper level the vein runs from six inches to the width of the drift, and averages $4.50 in fine gold by primitive milling. The sulphurets were not saved. The mouth of the lower level was caved and I could not get in to the level, hut was assured that the vein was here 15 feet in width and carried a large per cent of sulphurets that "go $124 a ton." There is an old ten-stamp mill on the mine which was evidently a good gold-loser.

GASTON HILL MINE.

The Gaston (G. Rodaseni, proprietor) is two miles south of El Dorado. The mine is opened by shaft 103 feet, with drift run on the vein 70 feet. The vein runs from six inches to three feet in width. The quartz from this mine is "lousy with gold." After separating all the rich rock, that remaining will mill $30 a ton. Mr. Rodaseni has a candle box of quartz from this mine that would he a credit to a World's Fair exhibit, as some of the specimens are more gold than quartz.

THE RITTER MINE.

G. Rodaseni is also proprietor of this mine. The Ritter is two miles north of El Dorado. The mine was opened by shaft 100 feet, which showed a vein of from one to three feet in width. The mine was last worked in 1858, when by the milling methods then employed the quartz gave $7 a ton in free gold, no sulphurets being saved.

All of the mines in the Sheep Ranch and El Dorado districts are in slate. The entire section has water for power which is sold at very reasonable rates. As will he seen, Mr. Rodaseni is the principal mine owner in the section. Owing to old age and a large amount of other husiness, Mr. Rodaseni is desirous of closing out all of his mines on satisfactory terms.

RAILROAD FLAT.

Since the days of the old Petticoat mine, with its three-foot vein of $100 quartz, the prospectors have stood hy the camp, and at this time everything points to a suhstantial reward. While the average vein is not large, the smallness of the vein is more than counterhalanced hy the high grade of the quartz, and, with a slate country rock, the expense of extracting is not great. It is commonly reported that in the old Petticoat mine the shaft left the shoot at the 200 foot level and pitched north. The superintendent sunk to 300 feet and drifted south; not finding the shoot there the mine was shut down and is still idle. It may seem strange that a three-foot vein of $100 quartz should he left open to location all this time, but there have been very few miners in the section ahle to reopen and prospect the mine. It looks like a good thing.

THE BALD EAGLE.

J. E. Enright is superintendent of this mine. It is two miles north of Railroad Flat. The vein is opened by tunnel from the side of the mountain 700 feet long. From the end of this tunnel a shaft has been put down 100 feet, giving a depth of 350 feet vertically on the three-foot vein. The superintendent is now crosscutting to the west vein. The mine has a complete 10-stamp water-power mill, and the situation of the mine is all that could he desired.

THE MCCANDO.

Dr. C. H. Beales is owner. The mine is in Railroad Flat, and the doctor has the shaft down 80 feet. A tunnel has heen driven 300 feet to tap the water in the shaft and the drift extended from the shaft a distance of 100 feet on the vein, showing an average width of two feet of quartz that yields an average of $12 a ton in free gold. A wing is now being put down on a shoot of ore that carries $60 to the ton and bids fair to repay the doctor very handsomely for his outlay. The Dr. has in operation an arrastre that crushes the ore from his own mine and that of a number of nearby mines.

KEYSTONE.

H. S. Ellsworth & Co. are proprietors of the claim. The mine is in Railroad Flat and is opened by a number of shafts. The one through which the mine is now heing worked is 100 feet deep with drift run 200 feet on the vein, which averages 12 inches in width. For a distance over 400 feet on the vein the quartz has averaged $30 a ton in free gold, which, in slate formation, makes it one of the nicest hig—little mines in the State. A French gentleman has discovered very rich quartz on the extension to the old Fine Gold mine and is doing very well with his two arrastres. It is reported that J. B. Haggin will start up the Fine Gold mine this season. Railroad Flat is a good poor man's camp with its high grade quartz in slate country rock and at the same time is a good point for investors wanting a good little mine.

WEST POINT.

There is very little "point" to West Point at this time. The camp is dead, hut while dead she gives promise of again awakening. The Blazing Star with its eight-foot vein of $125 ore is tied up in litigation. The Lone Star is doing developing work with the mill idle. Some Grass Valley people under the title of the Eureka Mining and Lumber Company are getting into shape to work several mines, while the Moore & Nixon mine is working a small force. I have never found West Point as dull as this time, but she's that kind of a camp, either up—way up—or down—way down.

Perhaps the most satisfactory statement of the actual value of the county's gold mines is that of the San Francisco Mint, which shows that the Sheep Ranch mine yielded $130,780.73 in 1891. The Utica $451,121.61 in 1891. That the entire output of the county for 1891 was $743,744,77—an increase over 1890 of $122,424.77 in 1891, while the output of the county from 1880 to 1891 inclusive is $6,963,962.25. It is a safe prediction that the output of 1892 will come up to the round million.

PINE LOG DISTRICT.

This section is ahout two miles northwest of Copperopolis, and is, I think, the lowest in altitude of any quartz mining district in the northern part of the State. To drive through field after field of grain and then come upon a quartz mine in full operation is as unexpected as it is uncommon. But right here in the plains is a belt that carries large veins of gold-bearing quartz which in the past have heen worked in a superficial manner with varying results. Mr. I. R. Wilhur and associates secured four locations on the belt, and under the title of the Royal G. & S. Mining Co. started in to see what there was in the section. Mr. D. Jutton, the superintendent, soon had a shaft down 185 feet and a drift of 125 feet run on the Royal, which proved it to be a vein of from 1½ to 12 feet with an average of 6 feet of fine ribbon quartz carrying 1½ per cent of very high-grade sulphurets. The rock carries very little free gold and is similar in this respect to the Golden Gate mine of Sonora; but whereas the former operators made very little out of the mines on this belt hy working the ores solely for their free gold contents, under Mr. Jutton's management the sulphurets pay nicely; and although the mine is but heing developed and equipped, thus early they meet all expenses. Once the mine is thoroughly developed and the mill increased to 40 stamps, the mine bids fair to rank as one of the best in the county. The situation is all that could be desired, right in the plains, with the railroad surveyed in sight, free water for milling, wood $3.50 a cord, supplies and labor very cheap, nothing more could be desired. The mine has now a 10-stamp mill with two six-foot Frues.

E. H. SCHAEFFLE.

A Hydraulic Giant and a Fire.

ANGELS, CALAVERAS CO.

TO THE EDITOR:—On the night of June 8th a fire broke out in the hlacksmith shop of the Utica mine. In less time than it takes to write it, the flames had reached the adjoining machine shop and then ignited the warehouse, filled with inflammable oils. The uoited heat aod flames from these three huildings ignited the gallows frame and a sheet of flame ran to the top of the hoist. At this time it looked as though the fine 60-stamp mill, which was but 50 feet distant, was doomed, and in all possihility, all Angels as well. Luckily, during the past, the superintendent had set up an old hydraulic giant in the rear of the mill, to sprinkle down with. The giant, when first put into use, had shown its power, under the 400 feet of pressure given it, hy lifting one end of the office roof and ventilating the mill by removing any window that chanced to come in the line of its aim, and was soon given the respect due its force.

When the flames shot up to the top of the hoist the giaot was turned loose and sent a solid stream of 300 inches of water clear across the top of the mill buildings and over the top of the hoist, 300 feet distant. The giant's stream swept out the flame, wherever it could reach it, in an instant, but unfortunately the giant could not he made to turn its stream around a corner, and in consequence the fire hlazed away where the giant's stream could not reach, until the hose on the opposite side of the mill was brought into service and the fire squelched. All credit is due to the good work done hy the old giant; but for it and its powerful stream of water the fire could not have heen checked and there would have been an immense loss to record.

Once the fire was out it was found that the hoist was only scorched, the mill uniojured, hut the hlacksmith shop, with all of its appliances, was gone. The machine shop, complete in every detail, with all the neccessary lathes and tables, was consumed, together with a complete electric lighting plant that was stored in the shop. The adjoining storehouse, with all of its supplies, was a thing of the past. The loss is difficult to estimate and can hest be got at by the cost of replacing the property destroyed. Luckily, there was no powder in the huildings at the time of the fire.

While the fire is a severe loss, the owners feel that they have every reason to congratulate themselves that it was not worse. With this experience they can arrange to prevent its repetition, or to better check any fire that may occur in the future. With two more giants so placed as to command the three angles occupied by the mine's buildings, a fire could not live, as a stream of 300 inches under 400 feet pressure would not only put out any fire, hut could be made to utterly demolish the building on fire. Here's to the much abused hut ever faithful old friend of the miner, "the hydraulic giant."

E. H. SCHAEFFLE.

A Mammoth Gold Deposit.

SALMON CITY, IDAHO, July 9, 1892.

TO THE EDITOR:—A stranger, looking up the main street of Salmon City on the evening of a clear day, when the sun is just setting, could not help heing struck by a prominent object cropping out of the foothills on the east side of the valley. It looks at that distance (16 miles) like a huge bank of yellow clay, hut a closer examination proves it to be an almost vertical cross-section of a sedimentary filling in an ancient river channel, that has heen cut down and partly eroded away hy a mountain stream that runs across its course.

It leaves an almost vertical bluff on the south side of the creek, that is 300 feet high and 800 feet wide, of what is supposed to be a volcanic ash or sediment. It forms a soft, silty rock that hreaks with a conchoidal fracture, without any grit in it coarse enough to dull a pocket-knife, with which it can be easily shaved. The bluff has heen slightly disturbed and faulted, but still shows horizontal deposit lines, as if it had been deposited by a slow-flowing current of large volume. In the absence of anything stronger to examine it with, it appears under a quartz glass to be composed of an exceedingly fine sandy mud, mixed with fine, transparent, scaly particles that look like the fragments of bursted volcanic bubhles. Some samples of the material were tested for lime, but they soak up hydrochloric acid like a sponge, without giving any perceptible reaction. This ancient river channel occupies what appears to he a synclinal trough, that coursed through a thick hed of cemented gravel, that shows up over 100 feet thick in places, and dips at an angle of from 30 to 50 degrees under the sediment from both sides of its course. This is underlaid again hy a series of thin beds made up of soft sandstone and clays, with fossil roots, ferns and leaves, and occasional thin beds of hituminous shale. The whole secondary formation of the valley looks like an ancient lake deposit, that has been tilted at different angles by suhsequent volcanic action.

This sediment bluff, with its 200-foot bank and cement bedrock, is virtually a placer deposit, and if I were to say that it sampled at the average rate of over $2 per cubic yard, or ahout $1,000,000 per acre, it would seem like an extravagant assertion. And yet the samples that were tested and indicated that result were quite fairly taken, in the following manner: By digging away the weathered surface with a pick, and taking out a chip every ten feet, up one side and down the other side of the hluff, with a few samples at intervals across the top. I did not take any across the base of the bluff, for the reason that the best assays of hand samples had been gotten from there, one of which went exceptionally high, probably owing to having been taken from near the hottom of the deposit. I was afraid a sample from there would make the assay misleading. The chips, amounting to 20 pounds were mixed up, pulverized and carefully sampled down, and the two opposite quarters on the last cut assayed. They varied only five cents, and the results were $1.25 and $1.30 per ton respectively. From this hluff west it is about two miles to where another creek cuts down through the course of the old channel, exposing another deposit of the same identical material, that is wider but not so high. A dozen pieces taken up through the center of this bluff sampled $1.50 in gold, and an average sample taken from a shaft that is sunk into the deposit between the two creeks assayed about $1.20 per ton.

This shaft was being sunk hy the owners of the ground at that point, in the expectatioo of finding a rich bed of free gravel under the sediment. They reasoned that it ought to be there, from the fact that of three creeks that have been successfully worked for placer gold, the pay has been found to extend above where this channel crosses their respective courses. The shaft passed through a hed of light blue gravel that carried some fine gold, but not enough to pay. They got down 30 feet without getting through the sediment, wheo they had to quit on account of the water coming in so rapidly.

A peculiar feature about this sediment and one that may have some scientific significance in this connection is, that all the samples tested showed more or less silver, and made an average nearly equal to the gold value. By panning, it is only one in about a dozen several ounce samples that after being pulverized shows any free gold, then it is in very fine, round particles that look like the float gold in the shifting bars of the Salmon river; but every sample shows a good prospect in hlack sand that may carry most of the value. Some of them also carry a heavy gray sand that hangs behind the black sand and is suggestive of

some of the rarer metals, for below where this old river course enters the Salmon river canyon, the rocker diggers get good prospects of a fine, bluish-white metal that hangs behind the gold in a pan, and must be either platinum or iridium, or both.

Aside from the sands mentioned it does not show the indications of anything base, but is the same composition throughout, with the exception of a little change in shade, some of the layers show a lighter brown than the general mass, and some a steel gray. Of course the results mentioned are exceedingly low for any material that has to go through a crushing process, yet it would crush as readily as most anything in a solidified form. If it were run through rock breakers, then dropped into a flume and conveyed about a mile by water on a steep grade over iron riffles, it would be worked out to a free running pulp, which, with the addition of more clear water, would be in an ideal shape for amalgamation and concentration. In this manner it could be worked very rapidly.

The natural conditions of water power and position, etc., could hardly be improved on if arranged to order, and when one considers the economical achievements of the Dalmatia, Spanish, and other California companies in handling low grade ores, where thousands of tons are mined and milled at a cost not exceeding 50 cents per ton, there is still quite a margin to work ore over that figure, and an interesting proposition to say the least, when its extent comes to be considered.

This old channel can be readily traced for 15 miles, showing in bold bluffs on the sides of the creeks that cut down through its course, in each case having the same foundation and general appearance. Mr. John M. South of Pratt Creek, one of the principal owners of the ground where the assays were taken, thinks he can trace it 50 miles. He has an idea that it was originally a large stream flowing through this valley from the North Snake river lava plains, and there is reason in his theory. The same cosmic forces that caused the sinks of the Big and Little Lost rivers, Birch creek and John Day river may at some earlier period have elevated the country about the heads of the Lemhi river and Birch creek, and changed the flow of what was probably once the largest, as it would be the most direct, branch of the Salmon river. There certainly must have been at one time a much larger volume of water flowing through the Lemhi valley than at the present time, while the lithological character of a large proportion of the wash gravel in its wide bars are foreign to the formations that underlie its present drainage.

If this sedimentary matter could be made to yield its gold value with any reasonable profit, there is enough of it virtually in sight to supply works of almost any imaginable magnitude, that would give employment to thousands of men and develop an industry of national as well as local importance. It is a proposition that is worthy the investigation of mining and metallurgical experts who may have the leisure to look into it.

Our placer mining boom continues to improve, and is resulting in some extensive and permanent developments, while there are new strikes being heard from every day. The quartz interests here are also receiving a close overhauling by the representatives of American and foreign capitalists. Mr. John Ely, of Nevada fame, is in the field. He has just about consummated a sale of the Lincoln group of mines, adjoining the famous Yellow Jacket property. The Lincoln is described as a huge porphyritic reef, carrying free gold to the value of $10 per ton, together with a good percentage of rich concentrates that have been tested and yield readily to the cyanide process. R. B.

Suum Cuique.

SAN FRANCISCO, July 5, 1892.

TO THE EDITOR: Your issue of July 2, in giving a timely and very interesting summing up of what seems to be known of the "Cyanide Process" contains among other articles one copied from the *Engineering and Mining Journal* of December 29, 1888, entitled "Cyanide of Potassium as a Lixiviation Agent for Silver Ores and Minerals." By the accidental omission of "Jr." attached to the name of the author, this article was apparently credited to myself instead of to my son, Louis Janin, Junior. The necessary correction was made in the succeeding issue of the *Journal*, January 5, 1889. Furthermore, the experiments referred to were made in 1886, and not, as wrongly quoted, in 1866.

LOUIS JANIN.

The Technical Society.

The Technical Society of the Pacific Coast held its last monthly meeting at their rooms in the Academy of Sciences building. C. E. Grunsky, presided. New members were elected as follows: M. P. Boss, mechanical engineer, of San Francisco, and G. W. Sherwood, civil engineer, of Riverside. W. R. Phillips, draughtsman, of Seattle, was elected associate member. Edward Lownes, formerly assistant city engineer of Los Angeles, now of Riverside, and William H. Sanders of Pomona were proposed for membership. The murder in Mexico of Andrew Fraser, a member of the society, was reported, and R. S. Moore, superintendent of the Risdon Iron Works, L. G. Russell, of H. P. Gregory & Co. and E. A. Rix of Rix & Birell were appointed to draw resolutions of regret and sympathy. A paper was read by Mr. Hugo P. Frear entitled "A problem in launching the Pacific Mail steamer Peru at the Union Iron Works." The paper was illustrated by a diagram of scales and curves and explained in strictly technical terms what goes on during the process of launching, the distribution of weights and the displacements at various stages. There was no discussion of the paper, as it presented merely a series of facts and computations. George W. Dickie and his brother, James Dickie, complimented Mr. Frear very highly on the research shown by him and upon the clearness of his essay, and the society passed a vote of thanks to the author.

Pioche District, Nevada.

At last things are looking very much better for Pioche and vicinity, says the *Record*. All the mines in the district and in the districts surrounding this are looking well, and many strikes of rich ore have been made within the past 60 days. Manager John C. Eames of the Pioche Con. M. & R. Co. states that while the properties of the company are not being worked as extensively as we might wish, yet what work is being done is daily proving up new and rich bodies of ore. The Pioche smelter has been running for the past 50 days, and at a handsome profit to the company. Most of the ores treated at the smelter on this run are the ores which were taken out in the development of the different mines. No effort has been made to make a large tonnage, especially from the Pioche Consolidated Co.'s properties.

All the ore smelted from the old Day mine has been drawn from the overproduction of the last few months, and although the mine is practically closed down, there are still over 3000 tons of ore in the bins ready for shipment. Probably the largest producer in this district is the Yuba. Only such ore as has been taken out in development has been shipped to the smelter, but from this ore there has been a net profit of over $20,000 during the last 30 days, and the mine in every particular is improving, both in grade, quantity and the amount of ore in sight, the last mill-run netting over $200 to the ton.

The No. 3 Meadow Valley shaft has recently been opened and active work is being done. About 15 men are employed cleaning out old drifts and in spiling from the crosscut on the tenth level on the Mazeppa vein to connect the Mazeppa shaft. In the last few days, very rich lead ore has been encountered, which, in early days, was considered too base for milling. The last assays from the ground opened run from 40 to 50 per cent lead and from 400 to 500 ozs. silver. A force of men has also been put at work on the old Lightner—or Raymond & Ely—shaft to retimber and put the same in perfect working order. It is possible that the company may conclude to start active work on the property. In such case, a large and modern mill will be built to treat the ore, of which there are hundreds of thousands of tons in sight. This ore, treated economically and properly, will yield a very handsome profit, but in the old days it was too low grade or contained too much lead to be handled at a profit with the facilities then at hand.

The smelter during the last few days has been treating the old Bristol slag, and putting through, with a low grade zinc ore from the Yuba, from 80 to 90 tons daily. As there are but a couple of thousand tons of slag remaining, the smelter will shortly treat the straight ores alone, and have all it can do.

There is certainly a better feeling in Pioche, and many mine and prospect owners are working their properties and endeavoring to find a sale for their ores. Of course the recent activity is due to the certainty almost of getting railroad connections with Salt Lake in the near future.

THE YUBA MINE.

In driving east on the 1300 level of the Yuba, a fine body of rich lead ore has been encountered over 300 feet from the shaft. Recent assays have run over 40 per cent lead and 120 ounces of silver to the ton. An upraise has been started, which is now 20 feet above the level, and the ore has widened out from six inches to over three feet. This is considered a very important strike, as it is virgin ground clear to the surface, and the ore found is in an entirely new and heretofore undiscovered ore chute and the principal workings of the mine lie to the west of the shaft.

The Yuba mine, owned by the Pioche Con. M. & R. Co., is certainly in luck. Recently it was desirable to get about ten tons a day of low grade zinc ore for the smelter, on account of the sulphur it contained, to mix with a high charge of Bristol slag. Just such ore was available on the 1200 level, and stoping was commenced. After taking out a couple of hundred tons, the low grade zinc ore turned into high grade lead ore, the pay streak being from three to five feet thick and extending along the level for over 150 feet. It can veritably be said that the Yuba is now or soon will be in bonanza.

REMARKABLE MINES.—There are many coal mines of which the galleries extend under the water of rivers, such as the mines near Leige, in Belgium, of which the galleries form a connection of the mines situated on both sides of the river, regular subaqueous tunnels; but more remarkable are those mines of which the galleries extend under the ocean, as is the case with some coal mines in England. More remarkable still is one of the coal mines at Nanaimo, on Departure Bay, beyond Victoria, British Columbia. This mine is known as the Wellington, and its galleries are situated 600 feet under the surface of the ocean, which here surrounds an archipelago of islands, very similar to the Thousand Islands, at the head of the St. Lawrence river. The length of the galleries of this mine is continually increasing, and extends at present six miles under the bottom of the waters of the Pacific Ocean. Nearly the whole population of the town of Nanaimo, amounting to nearly one-thousand, is engaged in the mines, and earns as much as $3 to $6 a day. Liberal as this appears to be, the cost of living in that inhospitable region is so high that the miners can only make ends meet. A great drawback in the mines is the excessive amount of combustible gases, by an explosion of which, three years ago, 100 miners lost their lives.—Coal Trade Journal.

COINAGE OF THE MINT.—The local Mint coined during the fiscal year just closed $25,593 983, consisting of $21,165,500 in double eagles, $1,155,000 in eagles, $1,079,500 in half eagles, $876,000 in standard dollars, $315,794 in half dollars, $676,020 in quarter dollars and $326,169 in dimes. The coinage during the previous fiscal year was $31,212,292, and the grand total since the local Mint was established in 1854 amounts to $952,274,338, of which $822,146,407 was in gold and $130,127,939 in silver.

The Copper Combination.

On the whole, the comments made by those authorities in the copper trade who are not directly connected with the producers are unfavorable to the international agreement, which to some extent partakes of the character of the "gentlemen's understanding," at one time conspicuous in another leading American industry. The great mining companies on both sides of the Atlantic have come together, and have practically decided not to crowd the market too much. According to English advices, the European companies, representing about one-half the total production, have agreed to place a limit on their production, in some cases reducing by five per cent that of the year 1891, while in others they have been allowed an increase, amounting in one instance to ten per cent. We believe that this deals practically with the large Spanish mines. At first the Europeans held out for some promise that the exports of American copper be placed at a certain maximum. This, as we understand it, they failed to carry, so that they must be content with hoping for the best in view of the restriction of the American mines. It is reported that nine companies, controlled by five interests, have undertaken to keep their output for one year from July 1st down to 226,000,000 pounds. These are the Anaconda with 75,000,000 pounds, the Calumet & Hecla with 60,000,000 pounds, the Bigelow-Lewisohn with 65,000,000 pounds, the Parrot with 14,000,000 pounds, and the Quincy with 12,000,000 pounds. This includes the majority of those who place large quantities of copper abroad. As we pointed out some time since, these interests made in 1891 204,000,000 pounds, so that the "restriction" did not look very formidable.

We believe, however, that the record of the first six months of the current year will show that, as a matter of fact, a yearly product of 226,000,000 pounds is very much below the rate which they have been running at, and that full work would carry the figures higher still. We have the data to estimate the product for the first six months of 1892 of the Calumet & Hecla, Quincy, Tamarack, Osceola and Kearsage on Lake Superior, and the Anaconda, Boston & Montana and Parrot, at not less than 140,000 000 pounds. For the greater part of the time the Butte & Boston was idle. With that plant going and all the others running at full capacity, the interests alluded to would put on the market during the year beginning July 1, 1892, not less than 300,000,000 pounds of copper. If they adhere to their agreement to produce only 226,000,000 pounds, they will keep the European market from a very dangerous collapse.

At first blush, this arrangement of a few interests, leaving out very important groups of mines, may seem a very weak one, but it must not be forgotten that they are practically the ones which are the heavy exporters. Really the only great concession has been made by the largest Montana concern, and, generally speaking, the producers of the Butte district are in a position where it is imperative with them to export largely. There are not in this country now refining facilities large enough to take care of all the Montana matte made, not to speak of the material which would be produced running full. A large share of the product must go abroad, and if the American mines were to go on at their full rate, they would swamp the European market, which would very seriously react on our own.

It is well known that this condition of affairs will not continue indefinitely. The leading Montana concerns are now getting ready to do their own refining by building electrolytic plants. The large establishments which this calls for cannot be created in a day; in fact, years may elapse before they cease to ship their matte to foreign countries. But the day is coming when the exports of copper matte will be as unimportant as those of ore now are, and American copper will go out in ingots, wire bars and slabs. Then the American mines will be the absolute dictators in the world's copper markets.—Iron Age.

IN THE LAVA BEDS.—Probably no other part of the world, excepting, perhaps, the Yellowstone Park, contains so many natural curiosities as Modoc county, Cal. The first, from a historical point of view, is the famous lava beds—scene of the Modoc war—a country of rocks, so full of caves that lakes and rivers are swallowed up, leaving nothing but a faint murmur to show their course through the bowels of the earth. In many of the caverns an army of men could hide, and in some places the intense heat of the rocks is evidence that internal fires are raging. In all parts of the county can be found mammoth hot springs, belching forth water strongly impregnated with minerals, and often close by will be caves of the purest ice. Medicine lake is a wonder that draws many visitors annually—a body of water that does not contain a living thing, and at certain hours of the day is full of a gelatinous, sponge-like substance that sinks and leaves the water clear. At the lake are two mountains—one of pure obsidian, the other of pumice stone, in layers.—Potter Four Corners.

THE COAL TRADE.—The private circular of I. Stewart gives the receipts of coal at this port in June at 85,900 tons, against 96,070 tons in June, 1891. The arrivals during the first six months of the year amounted to 607,800 tons, against 677,020 tons during the same period in 1891. The circular says: "The coal market continues in a depressed condition, with diminished consumption and little indication of any early improvement on the present low prices ruling, in consequence of foreign coal being offered for present and future loading at prices that preclude any advance for some months."

THE inevitable reduction of miners' wages which must be the result of low silver prices, has come. In all the leading mines of San Juan county, Colo., notices were posted last week that wages would be reduced 50 cents per day. This move was the only possible solution of the problem, if the mines are to continue at work, because, except in a few cases, silver cannot be produced at its present price.

MECHANICAL PROGRESS.

The Masonry of Boiler Settings.

The brick work about boiler settings is often very imperfectly laid. It is mostly done by contract, with no one to supervise it who understands the severe use to which it is to be put. The bricklayer, who may never have worked on a job of this kind before, builds good-looking inside and outside walls, but the space between is apt to be filled with odds and ends in the most promiscuous manner. Furtbermore, he puts the same joint in that he would use if he were building a house, and this is just what we do not want in a boiler setting, particularly in the fire brick lining of the furnace. The joints throughout the setting should be thin, and the work should be done as faitbfully inside as outside. Kaolin or prepared fire clay is used in laying the fire brick, and it should be mixed up so thin that it cannot well be used with a trowel. Some mill owners who have had experience in this direction will not allow a trowel to be employed at all, but require the men to use iron spoons. The fire brick should be dipped in water as they are used, so that when they are laid they will not immediately "drink up" the water from tbe cement. They should then receive a thin coating of the prepared fire clay or kaolin paste, and be carefully placed in position with as little of the kaolin or fire clay as possible. Every sixth course, beginning with tbe grates, should be a row of headers, well bonded into the masonry behind. The headers are of little use unless they are well secured into the walls of the setting, for when the lower courses nf fire brick have burnt away more or less, we have to rely on these headers to a considerable extent to hold the upper part of the wall in position. In repairing fire brick linings, the lower courses, which burn out fastest, can be removed and replaced without disturbing the upper part of the wall, provided the headers are secure, while if they are not, the entire wall may have to be rebuilt, and this cannot be done without either removing the boiler or tearing down a considerable part ot the setting.—The Locomotive.

Flying Machines.

Information reaches us through a reliable channel tbat Mr. Hiram Maxim's experimets, which he has been carrying on for some time in England, with a flying machine, are, for the present at least, at an end, no flying having yet been done, and the capitalists who were backing the enterprise having grown tired of the expense.

It will be remembered that Mr. Maxim some time ago gave some account of what had been done, in the *Century Magazine*. His article was modest in tone, and he refrained from doing much more than merely giving an account of what had been done; but it was all the more encouraging on that account, and there were undoubtedly very many who entertained great hopes that Mr. Maxim would be able to construct a machine that would fly. He may do it yet, but the present abandonment of his experiments does not look encouraging.

It seems more tban probable that if aerial flight is ever accomplished it will be done at a greater expenditure of power than would be required to transport the same loads at the same speeds by present means, but there would be, of course, great advantages in flight, which, for many purposes, would overbalance considerations of economy. It is quite certain that any device that requires a considerable expenditure of power merely to maintain its altitude or distance from the earth, must be at a great disadvantage as compared with present means of transportation, in which no power is required for this except that incidentally expended in overcoming friction introduced by tbe wheels and axles which maintain tbis altitude.

It will be recalled, doubtless, that Mr. W. H. Harrison has expressed the opinion in tbese columns that this wheel and axle arrangement was the ideal flying machine, and tbough the progress of a wagon over the surface of the eartb cannot be considered very closely analogous to flying, it may turn out to be about the closest approach to it that we shall attain. Nevertheless, all efforts to perfect a flying machine are not, of course, at an end, and intelligent perseverance often accomplishes wonders.—American Machinist.

A REMARKABLE LOCOMOTIVE BOILER.—A locomotive with a double-barrel boiler bas been designed by the mecbanical engineer of the Eastern railway of France, and has been built at that company's works. The lower barrel is filled with tubes, and is connected with the upper barrel by three necks and by tbe throat plate of the fire-box shell. The object is to have a boiler of large capacity without increasing the diameter beyond 4 ft. 4 in., so that it may fit between the driving wheels. The engine is of the eight-wheel type, with outside cylinders at about the middle of the engine, and driving the rear pair of driving wheels, tbis arrangement being considered best for high speeds. The valve motion is also outside. The four driving wheels are 6 ft. 6 in. diameter, and tbere is a four-wheel leading truck, with plate frames, and outside bearings. The engine is designed for hauling beavy passenger trains, and maintaining a continuous high rate of speed.

TRAINING MECHANICS. — The question why boys do not properly and thoroughly learn a trade in tbese days has been partly answered by an old employer, who says that boys, nowadays, are different from what they were when he was a boy. In the good old times they came to learn as much as possible, now to earn all the money they can. Then, apprentices were the children of comparatively well-to-do people, who took pains to bring their children up properly, and were more solicitous, by having their sons properly instructed and by making good mechanics of them, to make them independent of the world. Now, apprentices come mostly from the poorer classes, and are expected to bring home as much wages as possible, so as to help support the family. They only look for the immediate present, regardless of the future. The first question an apprentice asks is bow much he is to get a week; he thinks only of his earning capacity, and not of the time it takes to instruct him, nor of the materials he spoils. The next question generally is what hours he will have to work. The result is that is that employers now endeavor only to get as much work out of boys as they can, and take no interest in teaching them anything—in fact, boys in workshops, nowadays, are looked upon as so many necessary evils. When the employer ceases to be looked upon and respected as a teacher and educator, and only as an employer, tbere is an end of any hope for the proper instruction of boys in any mechanical trade. Times have changed, and with them old methods have passed away. We doubt very much if the newer methods are really an improvement. Time will tell.—Machinery.

RIVETED JOINTS.—The thorough and protracted experiments made recently with the famous Emery testing machine, relative to riveted joints, so far as American iron and steel are concerned, are regarded as determining the important question as to their value in practical work. In a series of five experiments with steel plates and iron rivets, holes punched, tbe sbearing resistance per square inch exhibited is stated to have been 39,740, 38,190 39,700, 38,638 and 41,100 pounds—the assumption being, in view of these results, that 38,000 pounds per square inch is a reliable estimate of the single shearing resistance of iron rivets in steel plates. This being the case, there remains to be determined the thickness of plate, diameter of rivet-hole and pitch of rivets, and in deciding upon these elements in the problem, it is necessary so to adjust the size and pitch of rivets as to make the shearing resistance of the latter as near as possible the strength of net section of the plate Computations show the efficiency of a single-riveted joint to be 56.6 per cent, and 63.3 per cent to be tbe efficiency of a double-riveted joint, while the efficiency of a triple-riveted joint is 75 per cent.—Manufacturers' Gazette.

DIVIDEND NOTICE.

The German Savings and Loan Society,
526 California Street.

FOR THE HALF YEAR ENDING JUNE 30, 1892, A dividend has been declared at the rate of five and one-tenth (5 1-10) per cent. per annum on Term Deposits, and four and one-quarter (4¼) per cent. per annum on Ordinary Deposits, payable on and after FRIDAY, July 1, 1892. GEO. TOURNY, Secretary.

AT A BARGAIN
For Sale Cheap, Six Second-Hand
FRUE CONCENTRATORS,
Good as New. Also Second-Hand
STEAM PUMPS
Of various makes.
RISDON IRON WORKS,
Cor. Beale and Howard Sts., San Francisco.

IF you wish to advertise anything anywhere at any time write to GEO. P. ROWELL & CO., No. 10, Spruce St., New York.

SHEET IRON PIPE

IRON PIPE
ALL SIZES, FOR GAS, STEAM AND WATER.
— WE MANUFACTURE —
SHEET IRON AND STEEL PIPE,
ALL SIZES
For Water Supply, Mining, Irrigating Purposes, Stock Ranches, Etc.
Made in Lengths Desired from 16 to 30 feet.

The Cut shows a Section of Three Joints
DOUBLE RIVETED SHEET IRON PIPE.
In the manufacture of this Pipe, we use only a high grade n annealed Charcoal Iron of great tensile strength.
The weight or thickness of metal used, is graded according to service required, and pressure to which the Pipe will be subjected.

FOR ALL UNDERGROUND PURPOSES, we immerse the Pipe in a bath containing a special mixture of ASPHALTUM, PITCH and PETROLEUM, at a Temperature of 300° Farenheit. It thus receives a thorough coating, both inside and outside, rendering it impervious to the alkalies of the earth, rust, etc., and is practically indestructible.

CORRUGATED IRON,
Black, Painted and Galvanized, for Roof and Sides of
HAY BARNS, DRY HOUSES, STABLES, ETC.
W. W. MONTAGUE & CO.
SAN FRANCISCO—SAN JOSE—LOS ANGELES.

THE BLASDEL
CONCENTRATING BELT COMPANY.

We have now made arrangements to have our new Improved Concentrating Belt manufactured in San Francisco. We keep always on hand Belts suitable for the Triumph and Frue machines, but can make any length or width desired. The advantages of these belts over *any others* will be readily seen by practical millmen.

First, the flanges or edges of our belt stand at an acute angle inclining toward the center, and therefore readily conform to the change of direction while passing over the end rollers; thus the vexation and loss caused by the frequent breaking of the flanges of the old style belt is practically done away with. Again, our belts, at intervals of two to four feet, have a very slight riffled surface for the space of three inches, which tends to equalize the pulp on the belt, and prevents it from banking on the sides and forming channels through the center. These slight riffles also save very fine sulphurets and the quicksilver that could otherwise escape with the tailings from a belt, the surface of which is entirely smooth. We can safely say that it is a better belt than has ever been manufactured for use on this coast. It will last much longer and will handle fully one-third more pulp than any smooth belt, and will save a higher percentage of sulphurets

H. G. BLASDEL, Jr., Manager, 419 California St., San Francisco.

PLACER AMALGAMATORS
Combined with Steam Shovel or Dredge.
BUCYRUS SYSTEM.
NEW METHOD OF PLACER MINING.
Saves all the Gold. Uses very little Water. Treats large quantities at Low Cost.
—BUILT SOLELY BY THE —
BUCYRUS STEAM SHOVEL AND DREDGE COMPANY,
BUCYRUS, OHIO. U. S. A.

THE GIANT POWDER COMPANY.
— PATENT OWNERS OF —
NOBEL'S DYNAMITE, NOBEL'S EXPLOSIVE GELATINE, NOBEL'S GELATINE-DYNAMITE, AND THE JUDSON IMPROVED POWDER.
Best and Strongest Explosives in the World.
JUDSON POWDER.
The only Reliable and Efficient Powder for Stump and Bank Blasting. Railroad Contractors and Farmer use no other. As others IMITATE our Giant Powder, so do they Judson, by manufacturing an inferior article.
BLACK POWDER.
The Giant Powder Co. having built Black Powder Works, with all the latest improvements, at Clipper Gap, Placer County, known as THE CLIPPER MILLS, offer this powder and guarantee it the best.
CAPS and FUSE at Lowest Rates.
THE GIANT POWDER COMPANY, 30 California St., San Francisco.

SCIENTIFIC PROGRESS.

THE PHONOSCOPE.—It was announced some time ago that M. Dumeny had succeeded in taking instantaneous photographs of the lips of a speaker, and is recombining them in a sort of zoetrope, so as to reproduce the original movements, and enable a deaf mute to understand what was said. He has recently improved on the process, and invented a new apparatus for combining the images, which he terms a phonoscope. The changes of the lips in speaking are so rapid that 15 photographs a second are required to give a good result. Moreover, several sets of images for the same phase are taken, so that nothing essential should be omitted. The whole head and bust of the speaker is photograped, so as to get the benefit of the expression. In the phonoscope the positives are arranged around the periphery of a disc, which is rapidly turned by a handle. A second disc, having a single window in it just opposite the plates, is also rotated by the same handle, but at a much higher speed than the other. A beam of sunlight illuminates the plates from behind, and the observer, looking into the apparatus, sees them pass his eyes one after another in such rapid succession as to produce the effect of a single image endowed with animation. To this end, at least ten or twelve must pass the retina in a second. M. Dumeny is so far satisfied with his results that he looks forward to a time when we shall possess veritable "speaking likenesses" of our friends. In short, the family album will be a kind of phonoscope, and contain photographs which will not ooly smile, but speak, or appear to speak to us, as though they were alive.—Electricity.

NEW GLYCERINE BAROMETER.—A communication to the Royal Dublin Society, by Mr. J. Joly. contains the description of a new mercury glycerine barometer which he has invented. This instrument has the full range of the glycerine barometer. The total length of the tube is, however, only about 250 cms. This result is attained by surmounting the glycerine in the tube by a column of mercury 67 cms. in length. By means of a float in the mercury which pulls a disc, loosely fitting the tube, against the base of the mercurial column, this is kept from breaking and falling down through the glycerine. In a uniform tube this column remains of invariable lengtb, and moves up and down with the glycerine. The balance of the atmospheric pressure is equilibrated by glycerine drawn from a bath of glycerine into which the lower end of the tube dips. Owing to the short length of tubing traversed by the viscous liquid, the instrument is probably more prompt than the full length glycerine barometer. On the other hand, there appears to be a very slow ascent of the glycerine past the mercury, which will probably necessitate the resetting of the instrument at intervals.

REPORTS are current of the invention by a Frenchman of a method for obtaining cellulose and oxalic acid from vegetable fibres contained in wood. In consists in reacting on wood with dilute nitric acid, in the presence of sulphuric acid, separating the intermediate product from the acid liquor which contains in solution the oxalic acid formed, and subjecting the intermediate product to a further treatment, for the purpose of removing the remaining incrusting matters from the cellulose. In the management of the acid liquor the plan pursued is to set it aside and subsequently subject it to a process for recovering the oxalic acid. The latter, dissolved in the weak nitric acid, can be obtained direct in the crystalline.form by repeatedly making use of the separated acid liquors for the treatment of fresh wood.

VOLTAIC ELECTROMOTIVE FORCE.—Recent investigations of the most exhaustive nature have shown that the *dilution* of the liquid of a voltaic element by water or alcohol, the *liquefaction* of the positive or negative metal by mercury, or the *dilution* of nne metal by another, by forming an alloy, is invariably followed by an increase of the *mean* electromotive force of the diluted and diluting substances and, cnnsequently, also of the *effective* electromotive force of the diluted substance, provided that no cbemical reaction is produced in the mixture. The evident explanation of this general result is that by the action of dissolution or dilution the molecules of the active substance withdraw from one another, and, consequently, acquire a higher speed of motion, and this naturally increases the electromotive force. But, in the same ratio as the chemical reactions manifest themselves, the gain of electromotive force is diminished and converted into a loss, and this loss is the greater the more energetic the chemical reaction. The method enables us to distinguish chemical compounds in alloys, amalgams and electrolytes from purely mechanical mixtures.

A NEW APPLICATION OF PHOTOGRAPHY. A most ingenious idea, patented by Mr. J. Joly of Dublin, relates to the combination of a photographic camera with a sextant, etc., so that an instantaneous photograph can be made, sbowing at once tbe dial of a chronometer, the horizontal line and (a suitable screen being interposed) the disc of the sun. From measurements subsequently made upon the plate, the aogular distance between the sun and the borizon is, of course, to be deduced. It seems probable that, witb a suitable optical system and sensitive film, the horizon line, in dull weather, may be more readily located by photographic means than by direct vision. On the whole, the invention is of a very promising character.—Optician.

THE CHEMISTRY OF NICKEL.—According to Herr P. Schutzenberger, the atomic weight of nickel seems definitely fixed at 58.6. An occlusion of oxygen is observed in a constant manner with nickel-oxide calcined at white redness and finely pulverized. The greenisb-yellow oxide, moderately calcined, does not present it, no more than does cobalt-oxide strongly calcined. Reduced nickel obtained from the strongly calcined oxide, instead of becoming agglomerated under the influence of heat into a single mass of a metallic lustre, remains in the state of a dull, dark-grey powder.

PACIFIC ROLLING MILL CO.,

.....MANUFACTURERS OF.....

Cast Steel Castings and Steel Forgings

UP TO 20,000 LBS. WEIGHT.

True to pattern and superior in strength, tonghnees and durability to Cast or Wrought Iron in any position or for any service.

GEARINGS, SHOES, DIES, CAMS, TAPPETS, PISTON-HEADS, RAILROAD and MACHINERY CASTINGS of Every Description.

—ALSO—

HOMOGENEOUS STEEL, SOFT and DUCTILE, SUPERIOR TO IRON FOR LOCOMOTIVE AND MARINE FORGINGS.

ALSO Steel Rods, from ¼ to 8 inch diameter and Flats from 1 to 8 inch. Angles, Tees, Channels and other shape Steel Wagon, Buggy, and Truck Tires, Plow Steel; Machinery and Special Shape Steel to size and lengths STEEL RAILS from 12 to 45 pounds per yard. ALSO, Railroad and Merchant Iron, Rolled Beams, Angle, Channel, and T Iron, Bridge and Machine Bolts, Lag Screws, Nuts, Washers, Ship and Boat Spikes; Steamboat Shafts, Cranks, Pistons, Connecting Rods, etc. Car and Locomotive Axles and Frames, and Iron Forgings of all kinds, Iron and Steel Bridge and Roof Work a Specialty.

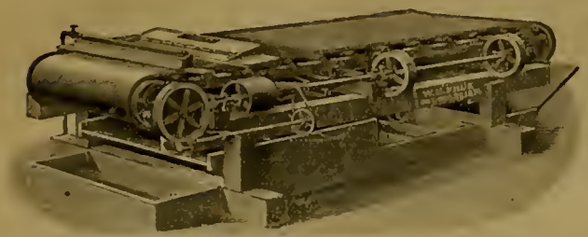
FRUE ORE CONCENTRATOR

OVER 3200 IN ACTUAL USE.

Manufactured under Patents of April 27, 1880; September 18, 1883; July 24, 1888; and March 31, 1891.



Price of 4-foot wide Plain Belt Frue Vanner..... $550, f. o. b.
" " " Improved Belt Frue Vanner ..... 800, f. o. b.
" 6-foot " Plain Belt Frue Vanner ..... 800, f. o. b.

GLADSTONE MINING COMPANY, C. J. Clark, M. E. Gen'l. Supt. FRENCH GULCH, Calaveras Co., Cal., Dec. 12, 1891.

MESSRS. ADAMS & CARTER, San Francisco, Cal.—DEAR SIRS: During my experience in mining and milling, I have used twenty-four of your four-foot Frue Vanners on different kinds of ore, both gold and silver. I have made competitive tests against them with other widely puffed-up concentrators and have always found the FRUE in first place. When I built this mill (20 stamps), I determined to put in six-foot Frues in order to save space and machinery. I am now running four of your six-foot machines and they have been going for TWELVE MONTHS. They are taking the pulp from 20 stamps, crushing a minimum of fifty tons per day, and do better work than the four-foot tables. They require no more attention than a four-foot table and handle at least twice the quantity of ore. I have run them up to 80 tons per day and could not see that they were crowded. They stop and start as easily as the smaller tables and have the advantage of double capacity with the same bearings and wearing parts, requiring no more oil, and no more wear and tear than the smaller tables. My repair account for the past six months has been too small to mention. In order to give an idea of the work they are doing here I will state that the ore has varied monthly from $5 to $20 per ton and the tailings from nothing to 60 cts. per ton. I will conclude by saying that I cannot endorse the six foot Frue Vanner too highly, and it is the only table that I would have in my mill.

C. J. CLARK, Gen'l Supt.

"TRIUMPH" ORE CONCENTRATOR WITH IMPROVED RIFFLED BELT.

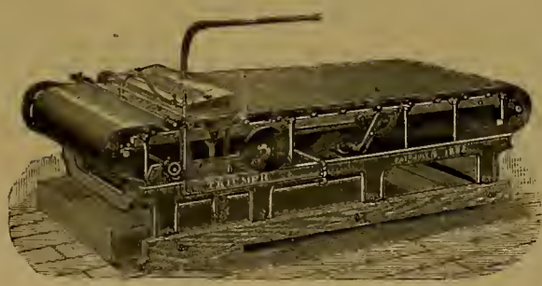
The competitive trials which have been held between the "Triumph" Ore Concentrators, the "Frue" Vanners and other forms of concentrating devices, do not warrant the assertion that the "Frue" Vanner is the best ore concentrator in the market. The fact that the "Frues" have improved (corrugated) belts does not militate against the superiority of the "Triumphs;" for, when desired, they (the "Triumphs") can be mounted with a superior belt known as the "Blasdel" Riffled.

—o—

Price "Triumph" Concentrators, with Improved (Patented) Belt - - - $650 f. o. b.
Price "Triumph" Concentrators, with Plain Belt - - - - - - - $550 f. o. b.

—o—

We are prepared to guarantee the superiority of the "Triumph" over the "Frue" or any other form of Concentrator, for coin if need be. Circulars and testimonial letters furnished on application.



JOSHUA HENDY MACHINE WORKS,
39 to 51 Fremont Street, San Francisco, Cal.

(PATENTED.)

Both the "Trimph" Concentrator and "Blaedel" (riffled) Belt are protected by incontestable letters patent, granted by the Government of the United States.

Original Empire Mill and Mining Company,
Principal Office, 401 California St., cor. Sansome, S. F.
Location of Works, Grass Valley, Nevada Co., Cal.

GRASS VALLEY, NEVADA CO., CAL., Nov. 10, 1885.

Joshua Hendy Machine Works, 39 to 51 Fremont St., S. F., Cal.:

GENTLEMEN—I am pleased to state, in reference to the "Triumph" Ore Concentrators, that four (4) of them were placed in the mill of the Original Empire Mill and Mining Company in April, 1884, and a thorough test made of their practical operation; and their efficiency having been demonstrated, four (4) more were subsequently introduced as the complement of the Twenty (20) Stamp Mill, and the eight (8) have been and are now running with entirely satisfactory results.

At the Ten (10) Stamp Mill of the North Star Mining Company, under my supervision, four (4) are also in successful operation, and from my observation of their practical workings, I am convinced that this form of Concentrators is the equal, if not superior to any other style of Vanners or concentrating devices. DAVID McKAY, JR.,

Signed] Sup't North Star and Original Empire Mining Co.

N. B. When the stamping capacity of the two above named mills was increased, more "Triumph" Concentrators were purchased, and twenty-eight (28) are now in constant successful operation.

USEFUL INFORMATION.

SOAP PRODUCTS.—A degree of superiority has long been claimed for some of their specialties in soap products by German manufacturers, and especially in the processes of coloriog. This latter, however, depends largely for its success or attractiveness on the materials used, these being mainly lard, tallow, cocoanut oil, palm oil, and to some extent, almond oil. The method of insuring a satisfactory color is thus a matter of discrimination—heavy, earthy or metallic colors, such as umber or vermillion, being added only when the soap has acquired a thick consistency, while dissolved colors may be added when the soap is still thin. Very few colors only can be made use of before all the lye has been run in and saponification begun, and aniline colors almost disappear at first under the action of the alkali, but return after cooling. The beautiful marbling effects produced is the result of simply stirring up the required color in melted cocoanut oil, runnning it into a funnel closed at the lower end by a finger, and allowing the contents to run over the soap as it is run in layers into the frame, and, on the frame being full, a stick is drawn in fancy figures through the soap to distribute the color. As compared with foreign countries, German manufacturers produce a much larger proportion of their toilet soaps by the color process.

ANTIDOTE FOR ELECTRIC SHOCK.—Is it too much to expect that the medical fraternity will discover an efficacious antidote for electric shock? Many unusual features are presented in cases of this description, but nearly all possess in common the evidences of unconsciousness or apparently suspended animation. It has been the custom of electrical workmen to immediately lay on the ground a person who has been shocked. The idea seems to be that the body is a sort of storage battery, and that contact with the earth effects a ground and discharge. The more probable theory is that the fresh air revives the patient. In shocks of a serious or fatal nature, it has been shown that the blood corpuscles of the victim have undergone an organic change. Can this be corrected and the blood normalized by the injection of a drug? An amateur investigator is reported to have found that the insertion of aromatic spirits of ammonia into the body of a bird which had received a shock brought the animal back to life after all signs of animation had disappeared. The question affords an interresting field for experimentation and it might bring fame to the physician who will devote his time and talents to a scientific investigation of it.—Electrical Review.

LACE HOLES IN LEATHER.—In reference to the tearing out of lace holes in leather belting, Messrs. Fayerweather & Ladew, of this city, say in their little treatise on machine belting, the more thoroughly stretched the band the more liable will it be to be complained of in this respect; not that stretching, properly done, *i. e.*, wet stretching, injures the fibre of the band, but that too much allowance is made for stretch in cutting off the proper length, or, in fact, the hand is made too short. If it is then put upon the pulleys it must be strained to its utmost tension in order to make the ends come together; when laced, the strain upon it will be of itself almost sufficient to break out the lace holes. When the machine is set in motion, the extra strain is more than the band will hear, and it gives way in its weakest place, the lacing breaks or the holes tear out. Then in all probability the broken end will be cut off on a line with the holes, making the band still shorter; new holes will be punched and the hand strained upon the pulleys to break away again with like result.

SPONGE-PROPAGATING. — The United States Government is considering the advisability of establishing a spooge-propagating station in Florida waters. The Florida sheep's wool sponge is extremely durable and valuable. Sponge-fishing has been carried on to such an extent that the Government finds it necessary to take some step to prevent the destruction of the industry. This industry began about the year 1852. Some 250 vessels, employing nearly 2000 men, are now actively engaged in creating the annual revenue of nearly $1,000,000. Sponges are found in the Atlantic as far north as Jupiter inlet. The industry at St. Mark's, at the head of the Apalachicola, competes sixth in rank with Key West. Most of the output goes to New York, about one-third being exported to Germany, France and Ireland.

MINERAL WOOL.—An industry has been established at Roanoke, Va., for the manufacture of mineral wool, the material for which is obtained almost close to the works. Some of the finer grades, though produced from the hardest rock, are as soft as the finest cotton. This mineral wool is indestructible and odorless. It will not burn, decompose or granulate, but will retain its fibre wherever placed. It is coming into large use as a lining between walls of buildings, thus providing a safeguard against fire, and insurance companies are reducing their rates on buildings so fitted. It is introduced into dry kilns, making them almost fireproof.

California Inventors Should consult DEWEY & CO. AMERICAN AND FOREIGN PATENT SOLICITORS, for obtaining Patents and Caveats. Established in 1860. Their long experience as journalists and large practice as Patent attorneys enables them to offer Pacific Coast Inventors far better service than they can obtain elsewhere. RISDON IRON WORKS PAYS THE FREIGHT.

Common Sense New Steel Whim
All Complete for $125, Freight Prepaid to any Railroad Station in California.
No cog wheels or clutches to break. Ninety per cent of this whim is wrought iron and steel, and will spring or bend instead of breaking, and besides, can be repaired at any blacksmith shop should breakage occur, thus obviating the necessity of sending away hundreds of miles sometimes and waiting a week for repairs. It can be packed anywhere a jack can go, the heaviest piece weighing 300 pounds. Total weight, 800 pounds.
It is just the whim to open up mines in isolated camps where steam power and experienced men are hard to get. With one horse 25 tons can be hoisted 300 feet on each shift. It is just as safe and reliable as an engine. Over 1800 in use, some running eight years without one dollar's expense. We make two, four and eight-horse power whims for heavy mining, also derrick whims and everything pertaining to horse power hoisting.
Buy a good whim and put more money into underground work is the way to open up a mine and make it pay.

ELECTRICITY.

The Efficiency of the Lauffen-Frankfort Transmission.

At last, after what appears to us an inexcusably long time, the results of the official measurements of the power transmission from Lauffen to Frankfort, by the three-phase alternating current, have been given to the public. These tests were made as early as October of last year, and it seems strange that it should have taken about seven months to calculate the results. A few bright American students could doubtless have made the calculations in a couple of days at the most. The results are a most excellent showing, and cannot help convincing the most skeptical. The maximum efficiency of 74 and 75 per cent from the turbine shaft to the lamps, 110 miles distant, through three No. 6 wires, is certainly excellent; and as the results are vouched for by Prof. H. F. Weber of Zurich, they can be relied upon as correct. It will be remembered by those who followed the description published in our columns last year that the line was smaller than it was intended to be, owing to the fact that it was a gratuitous loan. The curves show the effect of this small size very decidedly. If the line had been proportioned to suit the plant, the efficiency would have been still better for the larger loads. Another feature in its favor is that the dynamo and transformer, being both built for a greater output, would have had a greater efficiency if they had been run at full load. They were built for 200 kilowatts, or 270 metric h. p., while the largest load in the tests was less than 200 h. p. With the line properly proportioned to suit the rest of the plant, the efficiency would have been higher than 75 per cent, and would not have lowered for larger outputs, as it did in this case. It is, furthermore, not stated in the report what the voltage was, but from a very good authority, who was present at the tests, it appears to have been about 16,000 volts. This, also, is below what was originally intended to be used—namely, 25,000.

With this higher potential, the line losses, which are of course by far the greatest of all the losses, would have been considerably reduced. thus increasing the efficiency still more. Under the conditions for which the plant was originally built, the results would have been astonishingly good; but even under the adverse circumstances, they are excellent, and should convince even the most skeptical. It is to be regretted that more data was not given for the benefit of engineers, showing the results at very small loads, the current and loss in charging the line, the frequency, etc.; but this will doubtless all be forthcoming in the promised detailed report, which we fear, however, will be a long time coming. It can be seen from the curves and figures that the loss in induction and capacity, which some persons predicted would be so great as to make such a transmission prohibitory, are by no means very great. The shape of the curves will show some points regarding this question. As will readily be understood by engineers, the curves worked out by the author of the article show more than the mere figures published by the commission. It may be of interest to note here that as early as our issue of Sept. 5th we published a cable dispatch from private sources stating that the preliminary tests showed an efficiency of about 75 per cent. This is now shown to have been remarkably close to the real value. In our issue of Jan. 9th, we again published another estimate from a private and very reliable and conservative source that the efficiency was probably about 77 per cent. As will be seen now, this was very nearly correct, being still several per cent on the safe side.—Electrical World.

TELEPHONES.—Some interesting statistics have just been published by the Census Department regarding the operation of telephooes in this country, which, according to Supt. Porter, "Show how necessary the telephone service has become in commercial and social affairs, and speak volumes for the enterprise that has attended the development of inventive genius in this branch of the electrical industries." From the tables presented, it appears that in 1880 there were reported 148 companies, firms and persons operating telephone exchanges; in 1890, 53. The total investment in 1890 was $72,341,736, an increase of $57,735,949 in ten years. There was in the same time an increase of $13.306,502 in the gross earnings. and for the corresponding time an increase of $8,770,168 in the gross expenses, making the increase in the net earning $4,536,334! During the same period the number of exchanges increased from 437 to 1241, and the number of miles of wire from 34,305 to 240,412. There was necessarily an increase in the number of employes. In 1890, 8645 persons were employed, while in 1880 there were but 3338. The increase in the number of subscribers was correspondingly large, the returns showing 227,357, as against 48,414 ten years ago. Very few people, even in the electrical fraternity, have any idea of the general use of the telephone. and therefore it may occasion considerable surprise to announce that in 1890, according to the reports filed by the 53 companies engaged in the operation of exchanges, 453.200,000 conversations were carried on by telephone. No better evidence of the dependence of the American people on the telephone can be required.

BLOWING OUT AN ARC.—Central station men have always experienced considerable difficulty, says the *Electrical World*, in blowing out or otherwise interrupting an arc that has once formed across the terminals of a burned-out fuse or between the two poles of a switch on the face of a central station switchboard. The importance of the switchboard as the centre of distribution makes it imperative that this should always be kept in first-class working order. Hence any arc formed at the switches must be promptly interrupted before it has had time to do much, if any, damage. The method of doing this, suggested by Mr. Thomson in his article on "Central Stations," by dashing dry sand against the arc, is one which we think is not very generally practiced in this country. It is doubtless an effective, as it certainly is a cleanly, way of accomplishing what the agile dynamo tender is often compelled to do with more or less disastrous results to his much abused hat. Mr. Thomson also directs attention to a number of other practical points in central station construction and management that are the result of his own experience in this line of work, and for this reason they are especially deserving of careful attention. Many of our readers will take issue with him, however, in the preference which he gives to slow speed engines for all central stations of over 100-h. p. capacity. The continued erection of many plants in all parts of the country with high speed engines, driving dynamo units of from 200 to 300 h. p., may be taken as sufficient evidence that this type of plant has not yet met with disfavor among central station designers.

Machinery for Sale

FOR SALE CHEAP.

One 80-H. P. Taylor Beck High Speed Engine. in use but four months; 11½x15—replaced on account of size by 200 H. P. Ball Engine, at power house of Santa Cruz Electric Railroad. In first-class condition.

ALSO, The following Second-Hand Steam Pumps:

No 2 BLAKE, 4" steam, 2⅜" water, 5" stroke.

No. 10 HOOKER, 14" steam, 6" water, 16" stroke.

No. 6 THOMPSON & EVANS, 6" steam, 4" water, 10" stroke.

No. 8 CAMERON, 10" steam, 6" water, 13" stroke.

No. 4 DOW, 5½" steam, 3½" water. 8" stroke.

No. 6 DEANE 7½" steam, 5" water, 10" stroke.

DEANE DUPLEX, 6" steam, 4" water, 8" stroke.

WORTHINGTON DUPLEX, 6" steam, 4" water, 8" stroke.

ALSO,

CENTRIFUGAL, ELECTRIC and POWER PUMPS.

Valuable Books on Minerals, Mining

AND ASSAYING.

The Prospector's Field Book and Guide in the Search for and easy determination of Ores and other Useful Minerals. By Prof. H. S. Gehorn, LL.D., author of "A Practical Manual of Minerals, Mines, and Mining." Illustrated by 44 engravings. 12mo, 175 pages. Price.....$1.50

A Practical Manual of Minerals, Mines and Mining. Comprising suggestions as to the localities and associations of all the Useful Minerals; full descriptions of the most effective methods of both the qualitative and quantitative analyses of each of these minerals, and hints upon the various operations of mining, including architecture and construction. By Prof. H. S. Gehorn, LL.D. Illustrated by 171 engravings. 8vo, 367 pages. Price.....$4.50

☞ *A descriptive circular, giving the full tables of contents of the two books above named, sent free to any one who will send his address.*

A Treatise on Metalliferous Minerals and Mining. By D. C. Davies. With 148 Illustrations. 12 mo, 432 pages. Price.....$5.00

Mine Drainage. By Stephen Mitchell. 8vo, 277 engravings. Price.....$6 00

A Treatise on Earthy and Other Minerals and Mining. By D. C. Davies. With 76 engravings. 12mo. Price.....$5.00

Mineralogy Simplified. Easy Methods of Identifying Minerals, including Ores, by means of the Blowpipe, by Flame Reactions, by the Spectroscope, and by Humid Chemical Analysis, based on Von Kobell's Tables for the Determination of Minerals, etc. By Henri Erni, M. D. Illustrated. 12mo. Price.....$3.00

Underground Treasures: How and Where to Find Them. A Key for the Ready Determination of Minerals Within the United States. By James Orton. Price.....$1.50

The Assayer's Manual. An Abridged Treatise on the Docimastic Examination of Ores and Furnace and other Artificial Products. By Bruno Kerl, Professor in the Royal School of Mines; Member of the Royal Technical Commission for the Industries, and of the Imperial Patent Office, Berlin. Translated from the German by William T. Brannt, Editor of the "Techoo-Chemical Receipt Book," etc. Second American Edition, edited with extensive additions by F. Lynwood Garrison, member of the American Institute of Mining Engineers, Iron and Steel Institute, Verein Deutscher Eisenhuttenleute, etc. Illustrated by 87 engravings. 354 pages, 8vo, cloth. Price.....$3.00

☞ *A circular of 8 pages, quarto, giving the full Table of Contents of this important Book, as well as a new List of Leading Books on Metal-Mining, Metallurgy, Mineralogy, Assaying, Chemical Analysis, etc., sent free to any one in any part of the world who will apply*

☞ *The above or any of our Books sent by mail, free of postage, at the publication price, to any address in the world.*

☞ *Our new and revised Catalogue of Practical and Scientific Books, 88 pages, 8vo, and our other Catalogues, the whole covering every branch of Science applied to the Arts, sent free and free of postage to any one in any part of the world who will furnish us with his address.*

Extra sizes and lengths made to order on short notice.

611 & 613 Front St., San Francisco, Cal.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned

CALIFORNIA.

Butte.

MINING CLAIMS.—Palermo *Progress*, July 9: Bangor is said to be nine miles distant from Palermo, and when you have traveled from 12 to 15 miles you arrive. Here you would find the Bishop mine, which is being worked in a desultory fashion, but profitably. In another direction you would find the old Reyfus mine, where you can see the gold in the sides of the tunnels, speckling the blue cement at beautifully frequent intervals. Hay & Clark are getting ready to work this mine for all it is worth, and are putting several thousands of dollars into machinery for that purpose. Then start out for Oroville, over the Wyandotte road, and just outside of Bangor you will come to the mine which was once known as the Hyland. The present company calle it the Catskill, and every one about Bangor calls it the Marysville. It is down about 150 feet. The mine has a new foreman or superintendent (excuse me) about once in three weeks, on an average, but it is paying satisfactorily and may have a superintendent some day who will satisfy *all* the stockholders. The next mine we strike is Mr. Wheeler's at Wyandotte. This gentlemen is getting out some gold, and thinks his mine is on the same lead as the mines at Bangor, but the gold he gets is of a different kind, and it is probable that he is mistaken. However, he probably does not care so long as the gold is there. Coming to Oroville, we pass over the bridge and turn up the river, passing one of the largest mining enterprises in the State, that of the Golden Feather River Bed Mining Company, under the management of Msjor Frank McLaughlin. Work on this claim has just commenced this season, and the workmen are preparing to put in the auxiliary flume and pumps to drain out the river bed again. Above this, we come to the Golden Gate claim. Of this the only thing we notice is the great head dam, for this claim is not to be worked this year, the intention being to devote all the time to the Golden Feather claim, clean it out and tackle the Golden Gate the following year. The immense water power incidentally developed by the two dams is shortly to be utilized in driving several immense dynamos which will supply electrical power for other places and for working the mine in the river bed. Now, leaving Cherokee behind, and we should approach Paradise. A little ways out and we come to the Mineral Slide claim, which has been abandoned as costing too much to work. But if we should take this journey, we should only have time for a hasty visit to the five or six tunnels of the Magalia Consolidated before putting the horse up for the night. Well, here is the mine, and as they are not cleaning up to-day, Supt. Moody will allow us to visit it in all its branches. The tunnels enter the face of the hill direct, and interlace and communicate one with the other in bewildering fashion, but the most interesting fact of all in connection with the mine is that it is yielding about at the rate of $100 per day to the man.

MINING BOOM.—Oroville *Register*, July 11: Everything indicates a mining boom in Butte which will equal those of pioneer days. The rich gravel mines of Bangor, Magalia, Nimshew, Butte Creek, Gravel Range and other sections have attracted men of capital and energy. These mines are being opened and developed rapidly. On every side new mines are being taken up and prospected. It is thought that a thousand men will be at work within a few miles of Bangor within one year, yet this was one of the abandoned mining camps of the county. Never before was there such eagerness to secure mining ground by men of means. Never before was large capitalists being attracted here in such numbers. A 60-stamp mill will be soon erected at Forbestown; the Stow mine is doubling its stamps and will soon have 40 at work; the Golden Queen will soon be crushing again, while other mines in the neighborhood will ere long be ponring out gold. The Banner is being pushed ahead with 27 men diving deep for gold. The Palo Alto has 35 men getting out rich rock, while encouraging reports are heard from French Creek, Gravel Range and many other places. The stir and hum of mining is heard on every side; men talk of mines and of the golden ore more than ever in the past, and to-day the outlook for rich mines in the county is better than was ever before known.

Los Angeles.

THE AZUSA DISTRICT.—Cor. Los Angeles *Express*, July 2: The present owners of the old Kelsey mine, located about six miles up the canyon, have lately been packing ore down the mountain to the river, and hauling it thence to the railroad at Azusa, whence they ship it to Pueblo, Colo., for smelting. The reason they ship to that place is because of the presence of black sulphites, which cannot be treated successfully nearer home. They have made several shipments, and the returns thus far have been such as nearly to take the breath away from those most interested. One shipment of 17,000 pounds assayed $87,000, ar over $5000 per ton. This mine was discovered about 15 years ago by Lewis Sharp, now of Glendora, who developed it to some extent. It afterward passed into the hands of a syndicate, who held it under bond for some time. They made one or two shipments of ore to San Francisco, the assays of which proved very rich, hnt those who had the management, fearing that rich ore was only a pocket, adopted the policy of trying to sell out before the vein was exhausted, and since that time the mine has been kept closed to the public and an air of mystery thrown around it, until people became convinced that there was no well-defined vein of paying ore there. Lately, however, the owners, a company of New York capitalists, have begun development in earnest, with most gratifying results. The richness of the ores already shipped will undoubtedly make the future development of the mine assured, and it will also induce the owners of other mines and claims in that district to develop their properties. One advantage of the district is its nearness to railroad transportation. Within six miles are the tracks of the Santa Fe road, which avoids a long haul over the mountains, and supplies can be cheaply had. It will readily be seen that the future of Azusa is full of promise.

Humboldt.

WILLOW CREAK.—Blue Lake *Advocate*, July 5: Mining matters in the Willow creek and the Three creek sections are decidedly on the improve. Messrs. Kirk & Sinclair have located on a claim above the Golden Dawn. H. S. Soule has sold a half interest in his mine to S. T. Waller. The Moore claim has been sold to San Francisco parties, and the manager is here with both supplies and tools. This claim is situated between the Curran and the Samuel Bagley mines. Work is in progress on the Soule claim and also on the Getchell & Little claim. John Haney of the well-known Deerlick claim, after four days' work in his high bar, has a fine showing. Operations have begun on the Kelly and the Curran claims. It is reported that the machinery for Thomas Knight's mill on Three creeks is on the way. The Three creek mining section has been located from the source of that stream to the month. The Three creek mine, the Marion C, the Ethel, the Lodestar, the Enterprise and the Grandpa are among the mines that have been located on Three creeks. D. A. Wright of Acorn will commence operations on the Cora next week.

Nevada.

A GOOD CLEAN-UP.—Grass Valley *Telegraph*, July 7: A crushing recently made from the Norambagna mine yielded very well. There were 20 loads of ore taken from the upper tunnel of the mine by Faucett & Thompson, and it yielded 39 ounces of gold or about $31 per load. The ore was crushed at the Joe Southern mill.

SUPERINTENNENT RESIGNED.—L. P. Goldstone has resigned his position as superintendent of the Champion mine at Nevada City. Mr. Goldstone has done this in order to better his condition.

Siskiyou.

ON THE KLAMATH.—Yreka *Journal*, July 6: German, Courtney & Co., opening a claim in the Klamath above mouth of Shasta river, will no doubt take out a great amount of dust this season. They have 14 hands employed, and will soon commence bottoming their claim in channel, being now close to bedrock. In a little corner of the claim where bedrock was reached last week, they have realized about $50 a day, with only two buckets in use. At the old Capt. Pope garden, a company is gradnally sinking down to bedrock in channel, and expect to realize a rich haul of gold-dust, as the river is supposed to be rich in mineral deposits at that point. A couple of Oregon companies farther up the Klamath are also sinking down cuts to bedrock, with big expectations. This portion of the Klamath above mouth of Shasta river to Cottonwood or Hornbrook has not been worked since the '50 period, until the completion of railroad, and is undoubtedly very rich. In the Cottonwood creek vicinity, it is said that as high as $2000 was realized from a single pan of bedrock skimming in 1855.

Trinity.

NEW RIVER.—Cor. Trinity *Journal*, July 2: The many friends and acquaintances of Clement & Ladd of Boomer Mine will be glad to learn that said mine is paying quite a dividend this summer. The Excelsior Mill is busy at present crushing about 40 tons of ore, which is supposed by Mr. Colgrove, the superintendent, to realize $30 to $40 per ton. Leas and Nicholson of the Sherwood Mine have several men employed in taking out ore. They have about 60 tons ready to mill directly. Miller & Stone of the same mine have just crushed about 75 tons in their own mill. We have not learned the amount of the proceeds, but we are confident the returns are good. Fulmore & Miller, Jr., are busy at work in the same mine. They have not taken out any ore that we know of, but they expect to strike the ledge they are in pursuit of any day.

BIG BAR.—Blue Lake *Advocate*, July 5: Geo. W. Tinsley of Big Bar, Trinity county, was in Blue Lake last Sunday. Mr. Tinsley informs us that the Keely mine on Trinity river changed hands recently. Mrs. Keely sold it to a company of Chinamen. This mine is turning out some fine ore, and lately a big chunk valued at $47 was found. About 60 men are employed in that mine. The Taylor Flat mine, eight miles from Big Bar, of which Capt. Griffiths of San Francisco is the owner, is running industriously night and day with a crew of 15 men. About eight placer mines are now in active operation around Big Bar, and that village is enjoying lively times.

TRINITY CENTER.—Cor. *Journal*, July 9: John Critchlow hauled a 50-horse power steam engine into the Cinnabar mines last week for the McCaw Bros., and will haul the boiler in this week. H. L. Lowden passed through here yesterpay morning on his way to do some surveying at the Cinnabar mines, and, judging from present indications, one of the largest quicksilver mines in the world will be opened up at that place within a few months. Messrs. Hutchine and Allen are prospecting in the neighborhood of the Center. W. C. Watson, of San Francisco, and Roland Raines, of Igo, are prospecting near the headwaters of Coffee creek. R. D. Lawrence and J. Peters of Mendocino county, are prospecting on the South Fork of Coffee creek. C. Osborne and J. Trimbath, of Deadwood, have been prospecting on Snow gulch, but have started up Coffee creek. Dan Kitchen of Deadwood is prospecting on Copper creek, near Carrville. H. H. Dangherty and E. Edmundson of this place have been prospecting in the neighborhood of the North Fork of Coffee creek, and also on the headwaters of Clear creek. They have taken a prospecting trip to Six Mile creek, in company with C. M. Root of San Bernardino county. The quartz mine, owned by Strode & Bouder on Hostetter Gulch, near Carrville, continues to develop steadily under the work that is being done on it, and has proved to be a good property. Both men are below at present, negotiating for the purchase of a water wheel and additional machinery, and will put up a cannon-ball mill on their return.

Tuolumne.

ON JACKASS HILL.—Stockton *Mail*, July 7: A. O. Viertoug came down yesterday with his wife from Jackass Hill, Tuolumne county. Mr. Viertong has three fine mines on the hill with the unpolished name, and he confidently hopes that they will make him a millionaire. They are called the King Solomon's Ophir, John Donkey (polite for Jackass) and the Coarse Gold. The ledges are large and seem inexhaustible. The ore is very rich. The mines were discovered by Mrs. Viertong herself with her husband's indicators, and on ground that has been prospected a hundred times. Mr. Viertong told the old prospectors jocularly that they left the ledges for him.

NEVADA.

Washoe District.

CONS. CALIFORNIA AND VIRGINIA.—*Chronicle*, July 9: There has been extracted from all parts of the mine during the week 850 130-2000 tons of ore, which was shipped to the Morgan mill, the average value of which, per car samples, was $25.11 per ton. The average assay value of all the ore worked at that mill during the week, 840 tons, was $22.60 per ton, per battery samples. Bullion shipped to Carson Mint, assay value, $25,867.44.

OPHIR.—1465 Level—The drift running south 101 feet below the sill floor of the 1465 level, from the Mexican into the Ophir ground, has been extended during the week 12 feet; total length, 159 feet, continuing in a mixed formation of porphyry, clay and some quartz.

MEXICAN.—On the 1465 level the drift running north from the crosscut run east from the bottom of the winze sunk 101 feet below the sill floor of this level near the south boundary of the mine, at a point 40 feet east from the winze, has been advanced 13 feet; total length 133 feet; in porphyry and clay.

SIERRA NEVADA.—The east crosscut No. 1 from the north drift, 100 feet in Kenosha tunnel, has been advanced 30 feet, making its total distance 106 feet; face in porphyry and streaks of quartz.

ANNES.—On 420 level have retimbered a portion of north drift on east side of the ledge, and advanced the same 6 feet; face in quartz.

GOULD & CURRY.—The joint upraise with the Savage Co. from the Sutro tunnel level has been carried up 20 feet; total height 150 feet; face in porphyry and stringers of quartz. The joint winze from Savage, 1500 level, is now down 36 feet; face in porphyry and quartz. There is considerable water in the bottom that impedes rapid progress.

BEST & BELCHER.—North drift from east crosscut No. 1 has been advanced 18 feet through porphyry, seams of clay and stringers of quartz; total length 38 feet.

HALE & NORCROSS.—Main incline—We have cleaned out and repaired the main incline a distance of 25 feet during the past week, making its total depth 160 feet below the 1700 level. To-day we began the work of opening the station on the 1800 level in the incline. The bullion yield of the mine for the month of June was $19,810.53.

CHOLLAR.—Are reparing on the 650 and 750 levels. The east crosscut near the north line, 939 level, is in 50 feet; face in soft porphyry and clay.

POTOSI.—East crosscut from south drift from Potosi winze, 1150 level, is in 35 feet; face in low-grade quartz. North winze, 60 feet north of the Potosi winze connection, 1200 level, is in fair-grade ore. South drift from bottom of south winze, 1200 level, is in 35 feet; face shows 4 feet of $20 ore. Have started a drift north from top of raise on 1300 level, which is following 4 feet of quartz assaying $20. This drift will connect with the bottom of the north winze from the 1300 level. The joint Bullion winze is down 440 feet below the 1500 level; bottom in low-grade quartz. Extracted and sent to the mill in the past week 386¾ tons of ore from the 930, 1000, 1100, 1150 and 1200 levels. Milled during the week 381 tons. On hand at mill 81 tons; average battery assay $22.99; average car sample assays $22.93.

BULLION.—The joint Potosi winze is down 440 feet below the 1500 level; hnttom in low-grade quartz. Have started an east crosscut 560 feet south of north line, 1500 level, which is in 18 feet; face in quartz and clay. The joint northwest drift from the 1800 level of the Ward shaft, has a total length of 575 feet; face in porphyry.

OCCIDENTAL.—From the stopes on 350, 400 and 450 levels have extracted and milled 180 tone of ore of the average value of $24.20 per ton, as per car samples. Milled 150 tons; battery samples $22.40. Have resumed the proposed work on the 750 level and are driving No. 4 crosscut farther west from the main north drift. We have started an east crosscut from the Zadig drift from the Sutro tunnel, at a point 700 feet south of the main tunnel.

CON. NEW YORK.—The winze in No. 4 west crosscut, 650 level, is down on the slope 30 feet; the bottom shows an 18-inch streak of fair-grade ore. The west crosscut, 850 level, is in 31 feet; face in porphyry.

Ferguson District.

GOLD QUARTZ.—Pioche *Record*, July 2: W. J. Dooley returned from Ferguson district Sunday, bringing with him a 25 pound specimen of gold quartz from the April Fool mine. The whole piece averages a dollar a pound, and was shot out about four feet from the bottom of the shaft, where the ledge looks exceedingly well.

ARIZONA.

A PROMISING GOLD MINE.—*Silver Belt*, July 7: As the product of ten tons of ore worked in the Centennial mill, R. E. Humphrey has a 13-pound bar of bullion, and which, according to his test, shows the ore to go upward of $100 per ton in gold and silver, the gold very largely predominating. From another source, the value of the ore is given at $40 to $45 per ton, mostly gold. Accepting the latter estimate as correct, it sustains Mr. Humphrey's opinion that the ore carries gold and silver in paying quantities, which has been opposed and even scouted by many who are supposed to be good judges of ore. The assay value of the ore, taken in connection with the reported size of the vein, makes it one of the biggest mining propositions in the United States. The ledge is reported by Mr. Humphrey to be some 1500 feet wide, and from the bottom of the shaft, 34 feet, where the ore was taken for the test run, he has drifted between 60 and 70 feet, being in ore the entire distance. There are 75 tons of good ore on the dump, and it is claimed that ore can be mined in quantity sufficient to keep two or three mills running. A force of 12 men has been put on to develop the property.

BRITISH COLUMBIA.

A GREAT MINING FIELD.—Kamloops *Sentinel*, July 3: The discoveries which have lately been made in the valley of the North Thompson demonstrate that the valley of this river and its tributaries is a most promising mineral region, and one which to the present time remains almost entirely unexplored. The reasons for this belief are that the principal streams forming this river take their rise in the same district as do the waters of the Quesnelle and other large gold-carrying creeks and rivers which have made Fraser river and Cariboo famous for the last 30 years. The waters of the Thompson cut through the slaty rocks which carry the Cariboo gold, and also the limestone and other formations which furnish the argentiferous minerals of the Kootenay districts. Gold has been found in the quartz at Jameson creek, which is about 17 miles from Kamloops, and it also exists on the east bank of the North Thompson, near Lewis creek. Quartz rich in silver has been discovered near the junction of the Clearwater river with the North Thompson, about 75 miles from Kamloops. Mineral is known to exist in large quantities at Mahood lake, whose outlet is into the Clearwater. At Tum Tum lake, southeasterly from the upper valley of the North Thompson, very rich argentiferous ore was found many years ago. The sources of this lake reach easterly up to the summit of the Gold range, on the opposite or eastern side of which is Smith creek, where gold is now successfully mined. Tum Tum lake finds an outlet southerly into Adam's lake, a beautiful sheet of water, on the shores of which fine samples of galena or silver-lead ore have been found. There are no mining locations yet made in this extensive region, which is nearly 200 miles long and about 100 miles broad, reaching to the borders of Cariboo on the north-northwest and to Big Bend on the east, except a few which have been recently taken up.

OREGON.

CRACKER CREEK.—*Bedrock Democrat*, July 4: After years of waiting and futile experimenting in the reduction and treatment of the ores of the E. & E. mines at Cracker creek, the problem has been solved, and at last there is a certainty that hereafter these great mines will be successfully operated, and in a manner that will bring about an advanced movement in the mining districts southwest of Baker City—a change that has been anxiously anticipated several years. The *Democrat* is reliably informed that the work now being done by the Powder River Milling Co. at the E. & E. mine under the supervision of Mr. E. P. Cowen is highly satisfactory. Five stamps are running, reducing about 12 tons of ore per day of 24 hours, wet crushing, double discharge, 40 mesh, and the pulp is passed over three Luhrig vanners, which save between 75 and 80 per cent sulphurets contained in the ore, and making concentrates that assay from $150 to $300 gold per ton. It is understood that the result thus obtained is above the company's contract price with the Vanner Co., and that therefore 15 new vanners have been ordered and will be placed in the mill so soon as they can be gotten here from New York. With these in position, every one of the 20 stamps in the mill will be dropped, and 60 tons of ore per day will be put through. The Luhrig vanner solves the problem of working E. & E. ores, and the concentrates from these machines may be either shipped or treated by chlorination on the ground. We believe the E. & E. has blown its whistle for a long and most successful run, and that that whistle is the clarion presaging the dawn of a new era for base ore mining in Eastern Oregon.

SOUTH DAKOTA.

A SPLENDID BRICK.—Deadwood *Pioneer*, July 3: One of the cleanest and prettiest gold bricks ever seed in the city was brought up from the Golden Reward chlorination works last evening and deposited in the vault of the Deadwood National bank. It was the cleanup for the last 15 days in June, and weighed 1254 ounces, worth $23,199. This is about $6000 more than the usual product in the same length of time, and the increase was due to the large amount of ore out through. It is thought that the output can be kept up to this standard from now on.

MARKET REPORTS.

Local Markets.

SAN FRANCISCO, July 14, 1892.

Geoeral trade for the week under review has been fairly active, with a marked increase in the volume of goods gone out on orders. The call has been from coast ports, agricultural districts and mining centers. It is claimed that the buying, except for distant points, was confined largely to assortments, and that stock-purchasing will not he done until fall goods are received and opened out. The opinion gains ground that labor troubles at the East will throw considerable of the work that has gone East to iron workers on this coast. Whether this will prove to he the case remains to he seen, yet it must he admitted that, with a strong, determined fight at the East between millmen and employes, this coast will he in good position to reap a decided advantage, provided the raw material does not cost proportionately too much. Pittshurg mail advices report that the decline in pig iron at that point has, since February, 1892, heen as follows: Bessemer $1.75 per ton, Gray Forge 90c@$1, and No. 1 Foundry $1.15. Whether the present labor troubles in Pennsylvania will extend to the Western mills is, as yet an open question, hut it is claimed that while some are liahle to be affected, the majority will not he, owing to their having nonunion men. The local money market is easy. Collections the past week are said to have heen made closer than for several months past. The reserve fund in the hanks is said to he quite large, with a light call still ruling. Those in a position to know say that there will he a large demand for accommodations on grain in the warehouses, for farmers will store more freely than for several years past, unless prices for wheat should advance in the near future. This will naturally tie up large sums of money until farmers tire of holding and sell. Eastern mail advices report large dishursements of funds on accrued interest and dividends.

SILVER—The market advanced slightly early in the week, only to fall hack again owing to a prevailing opinion at the East, and also ahroad, that the Stewart silver hill would not he acted on by the House at this session of Congress. This opinion appears to he well grounded, for the House, on yesterday, refused to take up the hill for immediate actioo, which places it on the calendar. It is not likely to he reached this session. This action, it is hardly necessary to say, disappoints the friends of himetallism. What will he the outcome it is hard to say, hut it may prove a hoomerang to those who have operated oo the hear side of the market. It is a well established fact that a strong moneyed syndicate has heen operating in the metal, and, if there is a large short interest out, we may yet witness a rapid advance and high prices before the end of the year. If the move is only made to make the shorts fill, then the market will hardly remain up, hut fall hack again as soon as the object sought is accomplished.

Exports of silver hullion the past week aggregate as follows; To Japan, $52,200; Calcutta, $52,500.

MEXICAN DOLLARS—The market is quiet hut steady at 69@69¼. Exports hy sea the past week aggregate as follows: Hongkong, $238,768; Japan, $30,000.

QUICKSILVER—Receipts the past week aggregate 566 flasks. The market has ruled steady at current quotations.

BORAX—Receipts the past week aggrgate 1195 centals. Owing to low outward freighis hy sail to New York the exports are largely hy sea. The market is steady.

LIME—Receipts the past week aggregate 2318 hhls. The demand is quiet at around $1.40@$1.50.

ANTIMONY—The call is only fair. New York mail advices quote as follows: 11c for Haslett's, 12c for LX and 14c for Cookson's, in wholesale quantities.

PIG LEAD—The market has a strong tone in sympathy with the East, where strong holding and a good demand have strengthened prices.

TIN—Imports the past week aggregate 2288 iogots from Australia. Plate is fairly steady. The consumption is larger than was expected, hut heavy stocks keep prices from moving up. Pig is firm under a stroog holding. New York mail advices report pig as follows: "Some transfer of speculative holdings has taken place, hut the change alters the position of supplies in no important degree and new ventures are engaged in very cautiously. As a matter of fact, speculation has heen confined chiefly to the evening up of old deals, and purchases hy jobhers and consumers are limited as closely as possible to clearly defined wants. Futures are still at a discount in London.

MANUFACTURED IRON—The market is strong, with an advancing tendency in sympathy with higher prices at the East. The advance East is due to labor trouhle.

PIG IRON.—The market continues to rule in huyer's favor. Low markets, with the tendency still downward, at the East are against holders in this city. The European markets are reported barely steady at the recent decline.

COPPER.—London cahles to *Iron Age* report as follows: "Prices have averaged somewhat lower, hut concessions failed to attract huyers, and the market is rather dull. Chili charters last month were 1600 tons. Late sales of furnace material include 600 tons Montana argentiferous matte on private terms, and 500 tons do. at 9s 4½d. Imports of copper last six months 4867 tons, and the deliveries 1149 tons less than during the corresponding period last year." New York mail advices report that some disagreement as to the selling of Anaconda and Montana product is having more or less unfavorable effect upon the market for the same and indirectly upon values of Lake product. The nature of the misunderstanding is not made public, however, and whether it will lead to a rupture in the agreement to regulate production and exports, is problematical.

COAL.—Imports the past week aggregate 20,372 tons, distrihuted as follows: Nanaimo 4081, Newcastle, N. S. W., 6793, Swaosea, 6229, Cardiff, 701, New York, 443, Baltimore, 2125. The market is harely steady, notwithstanding an increasing consumption of steam reported. The stock here is lessening, hut the quantity on the way is large. Larger quantities are looked for from the coast collieries.

COKE.—Imports aggregate 1601 tons. The market is reported in huyer's favor.

Mining Share Market.

SAN FRANCISCO, July 14, 1892.

While the market for shares of the North End group of mines was firm throughout the past week, with higher prices toward the close, the shares of the Gold Hill group were weak at lower prices. Whether the shares of the two groups of mines are heing manipulated hy different stock pools is, as yet, an unsolved problem, although the action of the market justifies the helief that they are not heing maoipulated hy the same persons. It has heen many years since the several groups of mines were controlled and the shares manipulated hy different pools, hut when they were we had active and more prosperous times; now everything is lifeless—more dead than alive. It looks as if the causes for the erratic movements in the share market will he solved soon, for with Alvinza Hayward, D. O. Mills and J. L. Flood here, J. W. Mackay to arrive in this month and Francis G. Newlands and Senator J. P. Jones to arrive in next month, this mystery will, soon after they meet, he cleared away. With their conferring and all is found to he harmonious, then the share market will go to pieces, hut if they disagree and a fight for spoils takes place, a more aetive market and higher prices can he looked for. If this view is correct, then a conservative course, we think, would he the part of wisdom for outsiders to pursue until the probahle future policy of the rings is more clearly revealed. To sell the market short at present prices is dangerous, for if everything in sight is made, it hardly justifies the risk run, and to go long on the market then assessments, it is more than likely, will have to he paid and desperate chances taken of not heing ahle to sell io the near future at a sufficient profit to justify the venture. The last proposition is not hased on the condition of the mines, for they were never hefore in hetter working condition, hut it is made on the well-recognized fact that the mill rings, so far as their puhlic acts go to show, have not experienced a change of heart, and uotil they do it will continue assessments for outside shareholders and hullion for the rings. It will require the turning of the mills over to the mines to disahuse the puhlic of the well-grounded opinion that the mines are not honestly worked and the ore not milled in the interest of *all* shareholders. The developments in the Hale & Norcross suit were an eye opener.

It is difficult to get private and reliahle advices from the Comstock mines. This is undouhtedly due to a helief on the part of miners and others that a man who either divulges what is in the mioes or stands otherwise in the way of those in power is quietly "shelved" or made way with, accidentally of course, so that no tales can he told again. While this may have heen the case years ago, we hardly think it would he policy for those in power to pursue such a course now. Perhaps it may yet take the disclosing of some of the dark and hidden secrets of the Comstock to teach a lesson that will never he forgoiten, and at the same time prove the fallacy of the saying that dead men caonot tell tales.

S. White Jr., Chairman of the Committee on Mining Securities of the New York Consolidated Stock and Petroleum Exchange, is authority for the statement that a conference of the various mioing exchanges of the country will take place in September under the auspices of the Consolidated Exchange in the Exchange's huilding, in New York City. The object of this conference will he to agree upon some plan or plans which shall prove heneficial to all the mining exchanges in the United States. Who knows hut this may he the inauguration of a new era in the mining industry on this coast, particularly so since actual tests of two or more improved methods of milling low-grade and also refractory ores have resulted so favorahly.

The failure of the lower house of Congress to advance the Stewart Silver hill is used as a haodle hy the stock pools to get in more shares. The fact must not he lost sight of that the ore whlch is extracted on the Comstock is runniog more to gold. A few years ago the larger percentage was silver; now it is heing reversed. This change is fully set forth hy the monthly statemeots of the hullion outturn of the Con. Virginia Mioing Co.

Well-informed and at the the same time conservative persons, look with considerahle confidence to the work that is heing pushed in Belcher, Hale & Norcross, Con. Virginia and two or three other mines. In the two first-named mines, the work is of such a character as to eocourage the helief that important strikes are liahle to he made aoy day. It is rumored on the street that J. W. Mackay has heen telegraphed to return to the coast and inspect a strike in one of the mines that he and J. L. Flood are claimed to control. If there has heen such a strike, the superintendent of the mine in which it was made, failed to report it in his weekly letters, hut this is no uoosual thing, if reports are to he relied oo, for superintendents to do. The hattery assays of the ore milled hy Belcher and Crown Point are over $30 a ton, hut the quantity of ore was small. If the managers desired, it is claimed, a very large increase in the number of tons of ore extracted could have heen made and contioued for weeks to come.

From the outside the news grows in interest. It is claimed that dividends will he paid hy one or more companies.

"IT is becoming harder to sell electrical goods every day," mused an electric light salesmao. "A few years ago, the general public knew nothing of electricity and didn't pretend to. Then all I had to watch were the prices I submitted, as the buyer was apt to take the cheapest machine, irrespective of its merits. Nowadays, everybody knows a great deal of electricity, or thinks he does, which is worse, and I have to watch my prices and disabuse his mind of fallacious ideas at the same time.

Eastern Metal Markets.

NEW YORK, July 13.—The following are the closing prices the past week:

	Silver in London.	Silver in New York.	Copper.	Lead.	Tin.
Thursday	39¾	86¾	11 40	4 22½	20 80
Friday	39 13-16	..	11 25	4 22½	20 80
Saturday	39 13-16	87	11 25	4 22½	20 80
Monday	39 15-16	87½	11 25	4 20	20 55
Tuesday	39¾	86¾	11 20	4 10	21 45
Wednesday	39¾	86¾	11 20	4 10	21 50

Tin is steady at the decline. Quicksilver is steady. Borax is slower. Lead is weaker under more offering. Copper is unsettled. Pig iron is irregular and weak.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR THE WEEK ENDING JULY 5, 1892.

478,212.—TIME LOCK—L. N. Bedford, San Bernardino, Cal.

478,213.—TIME LOCK—L. N. Bedford, San Bernardino, Cal.

478,217.—DENTAL FOECEPS—C. E. Blake, Sr., S. F.

478,310.—WHIP SOCKET AND REIN HOLDER—T. F. Burkhard, S. F.

478,157.—FILTER—O. Eastman, S. F.

478,278.—FIEE LADDER—L. H. Fowler, Vallejo, Cal.

478,426.—RAILWAY CHAIE—Silas Harrie, S. F.

478,427.—RAILWAY CHAIR—Silas Harris, S. F.

478,428.—RAILWAY CHAIE—Silas Harris, S. F.

478,105.—WOONEN PIPE—A. M. Hawks, Tacoma, Wash.

478,253.—TRIPOD—Jas. Hewitt, Berkeley, Cal.

478,345.—MACBINE FOR WRAPPINO PAPEES—J. F. Lintbicum, Sacramento, Cal.

478,366. — EXPLOSIVE COMPOUNN — Samuel Rodgers, S. F.

478,531.—CLOTB-MEASUEINO MACHINE—Wilcox, Hallenbeck & Wandell, Albany, Or.

21,689.—DESION FOR WATOH CHAIN—D. L. Fry, Lebanon, Or.

The following brief list by telegraph, for July 12, will appear more complete on receipt of mail advices:

California—Samuel E. Ball, Winters, fruit gatherer; Ira Bishop and A. F. L. Bell, San Fraocisco, automatic trap for cable conduits and lifting mechanism for cable grips; Walfred Burkman, San Francisco, brick machine; William J. Connors and W. W. Eddy, Grass Valley, amalgamator; John H. Gaetsche, San Francisco, grinding-wheel attachment; William T. Gregg, Lakeport, window frame; Theodore McDonald, O. R. Williams and L. D. Hitzeroth, San Francisco, rope-driving apparatus; Antonio L. Navone, Calistoga, saw-swagging device; William D. Rogers, Alameda, and J. D. Van Buren, San Francisco, envelope opener; John T. Smith, San Francisco, railway rail; Charles Vogel, San Francisco, cable railway grip.

Oregon—John Finney, Portland, link lifter.

Washington—John D. Kirkwood, Pullman, vaginal syringe.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible (by mail for telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and fu the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESE U. S. and Foreign Patent Agency, the following are worthy of special mention:

TRIPOD.—James Hewitt, Berkeley. No. 478,233. Dated July 5, 1892. The object of this invention is to provide a simple, light and compact tripod more particularly intended for small photographic cameras, with which it is better associated, in that by its lightnese and compactness it will not add to the burden of those photograpers who carry the emaller classes of cameras only hecadse they are convenient. The diameter of the legs of the tripod can be so small and their length so reduced that when freed from the tripod head, and the feet drawn into the lower ends, the whole can be secured in very small compass.

EXPLOCIVE COMPOUND.—Samuel Rodgers, S. F., assignor to the U. S. Smokeless Powder Co. No. 478,366. Dated July 5, 1892. This new explosive compound consists of a combination of certain substances named in the patent.

FIRE LADDER.—Lewis H. Fowler, Vallejo. No. 478,278. Dated July 5, 1892. This is one of that class of fire ladders in which pivotally connected ladder and link sections are so joined as to enable the ladder to be folded or extended. The invention consists, in connection with a ladder of this description and the framework in which it is mounted, of peculiar and novel power mechanism for raising and in-

clining the ladder at any angle, and lowering it. The object of the invention is to provide a fire ladder which is adapted to be folded into small compass and readily extended and adjusted to position, the operation requiring the exercise of but small power.

WHIP SOCKET AND REIN HOLDER.—Theodore F. Burkhard, S. F. No. 478,310. Dated July 5, 1892. This consists in a socket to receive the whip butt, a swinging lever arm adapted to receive and hold the reins between itself and said socket, and a locking device operated by the movement of the lever arm in receiving and releasing the reins to hold and relieve the whip butt. The object is to provide a combined whip socket and rein holder in which, when the reins are in the holder and the vehicle left unattended, the whip shall be locked in its socket and cannot readily or easily be snatched from place and stolen; also to provide, in connection with the whip socket, a simple, convenient and effective rein holder.

MACHINE FOR WRAPPING PAPERS.—John F. Linthicum, Sacramento. No. 478,315. Dated July 5, 1892. This is a device for wrapping papers and pasting the wrappers together. It is worked by foot power. In addition to these features, the address may be stamped upon the wrappers as they pass through the machine, a stamping wheel being used for this purpose. The roller carrying the addresses is moved forward at each up-and-down movement of the slide of the machine.

HOT JOURNALS.—The *Manufacturers' Gazette* says: "If a journal becomes hot, it is dangerous to pour oil upon it for fear of causing a fire. Neither is it advisable to stop the machine, since the hot bearing is likely to stick or "freeze." The proper thing to do is first to apply a mixture of one part of sulphur and four parts salt, and then stop the machinery. There is then no danger of sticking or of creating a blaze when the oil is applied.

Complimentary Samples.

Persons receiving this paper marked, are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, $3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber please show the paper to others.

DELINQUENT SALE NOTICE.

THE BUTTE KING MINING COMPANY. LOCATION of principal place of business, San Francisco, California. Location of Works, Butte County, California.

Notice—There are delinquent upon the following described stock, on account of Assessment (No. 4) levied on the 4th day of June, 1892, the several amounts set opposite the names of the respective shareholders, as follows:

Assessment Notices.

GOULD & CURRY SILVER MINING COMPANY. Location of principal place of business, San Francisco, California; location of works, Virginia Storey County, Nevada.

Notice is hereby given that at a meeting of the Board of Trustees, held on the seventh (7th) day of June, 1892, an assessment (No. 69) of Twenty-five (25) Cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, Room 69 Nevada Block, No. 309 Montgomery Street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the twelfth (12th) day of July, 1892, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 4th day of August, 1892, to pay the delinquent assessment together with costs of advertising and expenses of sale.

By order of the Board of Trustees
ALFRED K. DURBROW, Secretary.
Office—Room No. 69 Nevada Block, No. 309 Montgomery Street, San Francisco, California.

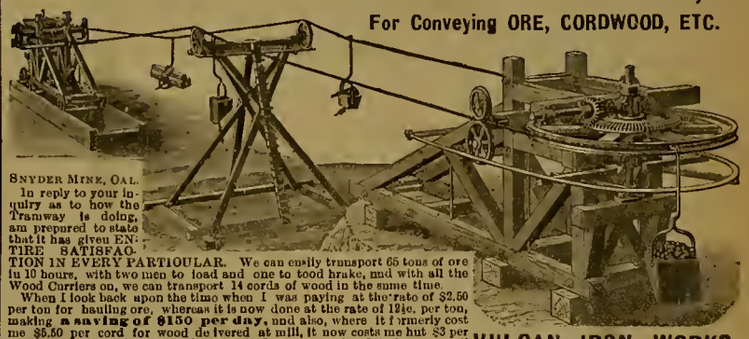
VULCAN WIRE ROPEWAY,
For Conveying ORE, CORDWOOD, ETC.



SNYDER MINE, CAL.
In reply to your inquiry as to how the Tramway is doing, am prepared to state that it has given ENTIRE SATISFACTION IN EVERY PARTICULAR. We can easily transport 65 tons of ore in 10 hours, with two men to load and one to tend brake, and with all the Wood Carriers on, we can transport 14 cords of wood in the same time.
When I look back upon the time when I was paying at the rate of $2.50 per ton for hauling ore, whereas it is now done at the rate of 12½c. per ton, making **a saving of $150 per day,** and also, where it formerly cost me $6.50 per cord for wood delivered at mill, it now costs me but $3 per cord, making a saving of $2.50 per cord—I must say that I feel pretty well over my Tramway investment for it is a PERFECT SUCCESS.
JAMES BARRON, Supt.
VULCAN IRON WORKS,
135-145 Fremont St, S. F.

LIDGERWOOD MFG. CO.,
— MANUFACTURERS OF —
HOISTING ENGINES.

Cooling Water for Condensing Steam.

On this coast where coal is so high in price, it is necessary to economize in its use in every way; and in this city water is expensive also, so that both items are of great importance where steam engines are used. Naturally, where large engines are required, the condensing type, as the most economical, is used; but where the water has to be purchased from the water company, that is a costly feature. It is only of late years that the cable railroads have commenced using the compound condensing enginee, the earlier roads built using the ordinary type where the steam discharges into the atmosphere. In order to economize the water used for condensing purposes, a plan has been adopted by which the heated water is pumped to the roof, cooled and again returned to be used in condensing the steam.

On this page is a cut showing the circulating pans on the roof of a cable-road engine house; and on page 59 are given sections and plan of the arrangement. As the steam exhausts into the condenser, it is condensed by jets of water and all this water flows into the hot well. From this, whatever hot water is required for feed water for the boilers is pumped back into them. The rest of it, by far the larger proportion, is forced by a circulating pump on to the pans on the roof of the building. These pans or shelves are shallow troughs of galvanized iron arranged in tiers on a slight incline so that the water in them flows back and forth for 1500 or 2000 feet, being cooled as it flows. The pans are five feet in width and about an inch deep it water flows in them. From one-third to one-half the volume of water is lost by evaporation. The circulating pans are set so as to go entirely around the building several times, on the roof or over such space as can be given to them. In some instances, as shown in the cut, vertical partitions are set in portions so as to make the water go back and forth as well as flow onward. This feature, however, is found to be of little value.

CIRCULATING PANS FOR COOLING WATER FOR COMPOUND CONDENSING ENGINES.

With the condensing engines the saving of coal is quite large, and it will be seen that by thus using the water repeatedly the water bills are materially reduced. Before this plan was adopted, high-pressure engines were used on the cable roads but no condensing apparatus was used. Some of them are still using the old system, but this described is used at both engine houses of the Omnibus system, on the California street and Union street systems. At each of the four engine houses there is some little variation in detail, but the general features are the same. It is found to be highly economical and satisfactory. The plan had been tried on a small scale at the Union and the Risdon iron works, but the application of the large circulating-pan system to cable engine houses was due to Mr. J. C. H. Stnt, the mechanical engineer of this city, who drew the designs shown in our engravings, as well as those for the other engine houses. The temperature of the water is reduced from 40 to 50 degrees during its passage through the pans according to the weather. During the visit of the members of the American Society of Mechanical Engineers to this city, this system attracted their attention greatly as one of the most interesting devices they had seen.

THE trouble at the Cœur d'Alene mines is practically at an end, and work has been resumed with wages at $3.50 per day for miners and $3 per day for shovelers, with the right to board and lodge where they please. The troops are still at the mines. Although the miners' union in the Cœur d'Alenes is completely broken up and the mine owners free of its halter, it will require the presence of the Federal troops for six months or more to insure the workmen immunity from attack. One hundred and eleven men have been arrested at Wardner, and there are 190 confined at Wallace. Marshal Pinkham has been looking over the prisoners and is busy getting out indictments against the principal ones. They will all be taken to Boise in a few days to answer charges of contempt of court, and will then be returned to stand trial on several indictments.

AT the annual meeting of the stockholders of the Union Consolidated Mining Company, 85,159 shares were represented and the following officers elected for the ensuing year: Robert Sherwood, president; Charles H. Fish, vice-president, and W. S. Lyle, Charles Hirschfeld and A. G. Gurnet, directors. D. B. Lyman was reelected superintendent and A. W. Barrows reelected secretary.

An Amalgamating Device.

Wm. J. Connors and Wm. W. Eddy of Grass Valley have patented, through the MINING AND SCIENTIFIC PRESS Patent Agency, an amalgamator arranged so that, the surface being kept clean, automatically presents a fresh surface to the pulp continually. The pulp passes from the mortar down a short apron, and thence falls on to a transverse, rotating cylinder. The surface of the cylinder is covered with silvered copper plate. The apron of the mortar extends to and lies directly above the top of the cylinder. Pivoted on this apron is a regulating plate, which can be raised or lowered and brought into more or less proximity to the surface of the cylinder to regulate the feed of the pulp according to whether the battery is using a coarse or fine screen. The undersurface of this regulating plate is an amalgamating one to catch the free fine gold.

In the bed of the frame below the cylinder is formed a receiving chamber. Into this the cylinder extends at its lower portion, and from it issues a drawing-off passage controlled by a plug. Across the lower back portion of the cylinder is a perforated water-pipe in a position to direct streams of water and wash off the surface of the cylinder into the receiving chamber below. A gravity scraper acts against the rear surface of the cylinder, its end being covered with rubber or other suitable protecting material. On the cylinder, which is continually rotating, the pulp falls and is carried by it over its front. The tailings fall into a discharge sluice, while the amalgam drops into the receiving chamber. Particles still clinging are washed off by the sprinkler, and the water and the scraper serve to effectually clean the surface of the cylinder, so that above it always presents a clean surface to receive the pulp. Any suitable mechanism may be employed to drive the cylinder.

AT the annual meeting of the stockholders of the California Electric Light Company, representing a total of 37,300 shares, the following were elected directors of the company for the ensuing year: P. B. Cornwall, Gustav Sutro, Arthur W. Moore, Geo. H. Roe, John R. Spring, William Kerr and D. Marcucci. The new board then elected Geo. H. Roe secretary and manager, Gustav Sutro president, and John R. Spring vice-president.

ALMOST the entire proceedings of the National Mining Congress were devoted to the silver issue. The next meeting will be held at Salt Lake on December 3rd.

THE guide who murdered Andrew Fraser of the Risdon Iron Works in Mexico has been captured and placed in jail. His name is Antonio Ochoa.

Status of Labor Unions.

The action of the labor unions in the recent troubles in Pennsylvania and Idaho calls attention to the irresponsibility attending such organizations. In the former place the men, naturally, we think, objected to armed mercenaries being brought against them. In Idaho, threats were made against the troops brought in to quell the disturbances, but in the end there was no resistance and the troops took possession of the company's property. It is probable that bad troops, instead of Pinkerton men, heen brought at first to Homestead, there would have been no bloodshed.

But if this Pinkerton band is a private one, with no responsibility to city, county, State or nation, and only to the men who hire it, what is the labor union which called it forth? Is it any more responsible a body itself? The unions are self-made, and not corporations created by the State in accordance with law. As at present existing, they are responsible to no one, not even to their leaders who may he deposed in a moment.

If the individuals composing these labor organizations were responsible for the acts of the body, as are the stockholders of a corporation, they would be a great deal more careful of how they damaged the property of others. A band of men calling themselves a labor union attack works, burn buildings, hlow up shops, destroy machinery and damage the plant, because they do not want others to take the places they themselves decline to fill at the wages offered. Now they have a perfect right to decline the wages and do all they lawfully can to compel the owners of the works to maintain suitable pay. But when it comes to arming and destroying property, there ought to be some means to hold the men to account for it. There is nothing in a labor union which is at all tangible, as far as suits for damages are concerned, but there should be.

Employers can be held responsible for accident to life or limb of employes. It is only fair play to hold the employe responsihle for his acts as well, especially when they are unlawful. The puhlic generally sympathize with the wage-earner in his contests with capital on the subject of day's pay, hut they have no sympathy whatever when overt acts are committed such as have occurred during the recent labor trouhles. Neither the steel works nor mines are puhlic institutions by any means. Both are private property owned by corporations. The men have no right to touch a single portion of this property without due process of law. Labor unions will never make any progress in public estimation or in practical results, when tbey commit such outrages as we have seen of late. If such occurrences are to become common, capitalists will simply decline to invest in properties where they are liable to be at the mercy of the unions.

Tbe general laws of the country should be arranged to meet the circumstance of the day. When a man joins a labor union, or, as a matter of fact, any organization having the avowed object of being opposed under certain conditions to employers, then some responsibility should be attached to him for the acts of the organization. At present the body of men calling itself a labor union becomes angry and destroys property, no matter for what reason, and the union cannot be called to account. A few leaders may be caught, but the men causing the damage generally go free. This is all wrong. Decent unions would have nothing to fear from responsibility; but when the members burn and destroy other people's property, they should be punished by fine or imprisonment. This is a country of supposed equal rights. Under present conditions, the laboring men can call on the employer for damages, but the employer has little chance to retaliate when occasion demands it.

The Caminetti Hydraulic Mining Bill.

The Caminetti hydraulic mining bill passed the lower house of Congress on Monday by a vote of 143 to 43, considerably more than the required two-thirds majority. It was suspension day for committee bills, and the measure was brought up then instead of waiting for the regular suspension day. Cbairman Cowles of the Committee on Mines and Mining presented the bill, and Caminetti made the opening and closing speeches in its favor. Loud and Bowers also spoke in its favor, and the three of tbem met every argument made against the bill by its opponents. At the very outset the old opposition showed itself. Watson of Georgia demanded a second, as Bailey had done when the bill was up before, and at one time there was fear of the bill suffering a second rebuff, as a quorum would not be present. Tbere was scurrying through the cloak and committee-rooms and the restaurant, and at last the necessary number passed through the tellers. Then Bailey and Watson attacked the measure on the ground of unconstitutionality, maintaining that Congress had no right to interfere; that it was a matter for the State to attend to; that the enactment of such a law would be substantially a reversal of the decisions of the State courts. Bynum of Indiana made the novel statement that the Sacramento and San Joaquin rivers were not navigable. Upon these points the House was set right hy tbe Californians, who also showed the great benefits that would accrue to the State by the measure.

The hill is by no means the same as originally drafted, many amendments having been made to it. The Government will build no debris dams at all, that being left to the miners themselves, under regulations of a debris commission composed of Government engineers. The appropriation has been cut down from over $400,000 to $15,000, or just enough to pay the expenses of tbe commission wbich will have the supervision of the construction of all impounding dams and restriction works. There are other changes in the bill, but tbey apply principally to the duties of the commission and the method of procedure to secure permission to build a dam.

One amended section provides tbat the jurisdiction of the commission shall extend to all mining in the territory drained by the Sacramento and San Joaquin river systems. Hydraulic mining, directly or indirectly injuring the navigability of the river systems, carried on in this territory, except as permitted under the provisions of the Act, is prohibited and declared to be unlawful. Another new section of some importance, suggested by the California engineering commission, provides that the commission, in order to secure harmony in the work, to he constructed for reclamation and drainage purposes on the river systems mentioned, is empowered to consult from time to time with the commission of engineers, which is authorized to join in such conferences by the laws of the State of California. The result of such conferences shall be reported to the chief of engineers for transmission to Congress. The consent of the United States, in so far as it is necessary to confer the same on account of its reserved control over these navigable rivers, is granted to the State of California or any municipal or local organization authorized by the laws of the State to construct such works at its expense, provided that whenever the navigable waters of the systems are or may he affected therehy plans therefor shall be recommended hy the commission created by this Act and approved by the chief of engineers of the United States army.

Congressman Caminetti says the bill as it passed should properly be entitled a bill to create a California river and debris commission. The Sacramento and San Joaquin rivers will, if it becomes a law, be treated like the Missouri and Mississippi rivers are by the respective Government commissions in their charge. Such treatment means their permanent and systematic improvement. This is the certain result. The bill offers a solution of the hydraulic mining question. Experience will show wherein it needs modification. Congress, now that the path is opened, will await results and without doubt grant such changes as will be for the public interest. The great difficulty in this fight was that the miners were even asking for a law that has no precedent—an innovation in fact. It has taken years of work in session after session of Congress to secure the laws organizing the Mississippi and Missouri River commissions. These did not contain the complicated questions involved in the present bill. Changes have been made to meet tbe requirements of different members of the House, but an analysis of the bill will develop the fact that an important forward movement has been made hoth for river improvement and a solution of the mining problem.

The text of the bill, with all the changes which were made in it before passage, is about the same as when it came from the committee, except that in Section 3 the last sentence is made to read: "Hydraulic mining, as defined in Section 8 hereof, directly or indirectly injuring the navigation of said river system carried on in said territory other thau as permitted under the provisions of this Act, is hereby prohibited."

The end of the proviso in Section 15 is made to read that "The owner or owners of such mine or mines be permitted to commence operations."

Sections 20 and 24 are stricken out entirely. In Section 25, the word "may" is changed to "shall," so as to compel the prevention of injury to navigahle rivers, instead of leaving it merely permissible to prevent it. The appropriation of $15,000 is made immediately available to defray the expenses of the commission. All reference to exact locations of dams, as originally provided for, is cut out. The bill, as drawn, appropriated specified sums for dams at certain points on each stream, but this is all dispensed with. The miners can tbemselves now build under advice of the commission of engineers, such dams as they may desire to restrain the debris. Upon these being constructed, the miner can apply for a license to work his mine. A hearing will be had before the commission, and if the commission is satisfied the dam will accomplish its purpose without injuring rivers or adjacent lands, a license will be issued. When issued, the miners can go to work. If, however, at any time the engineers find the works do not restrain the debris, they can revoke the license.

Many miners, without douht, will find fault with this bill and object to several of its features if it becomes a law. Tbis is inevitahle, but tbe general interests of the whole community are considered in tbis bill—those of the miners and the farmers. The clause prohibiting all hydraulic mining, except under provisions of the Act, will be considered a sethack by some miners, but this is of no moment, for tbe simple reason that it is practically prohibited now. Moreover, the fact is a clause was put in the River and Harbor bill of 1890 prohibiting the dumping of refuse or waste of any kind into rivers or harbors. Until that became a law tbe Government had no power to prevent the destruction of navigable streams. A severe penalty is provided, and the U. S. Courts given jurisdiction to hear cases. This covers the case of tailings from a gravel mine, as well as sawdust from a sawmill, and is general for the whole country.

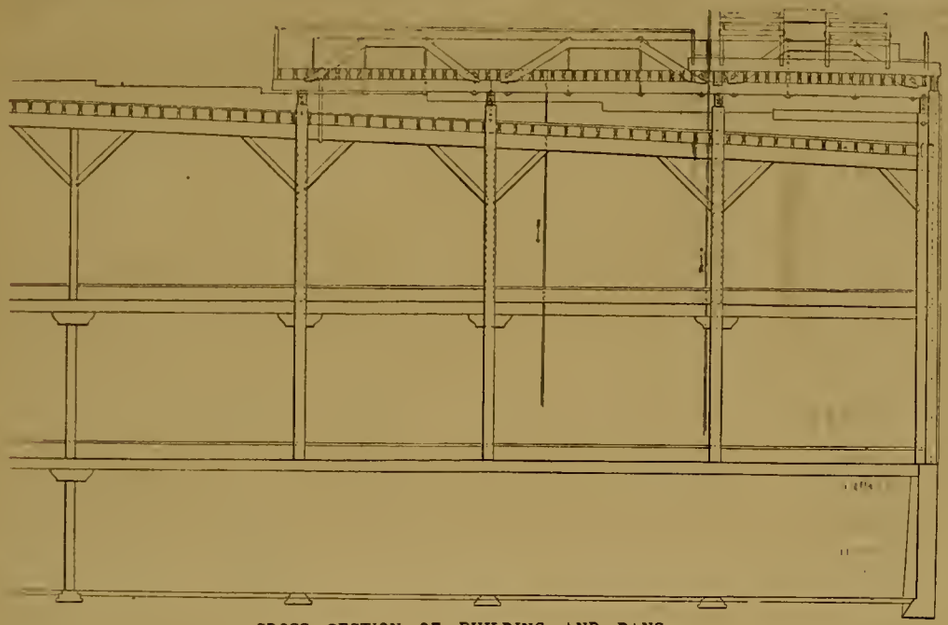
The miners have been in a position to be jailed and fined for some time, and there was nothing giving them any right to mine hy the hydraulic system. But tbis bill does give them this right under certain specified conditions. It gives them a chance to work their claims where they can do it without injuring other interests. This is all they have asked for practically, and all they can properly expect. The clause providing for the right of eminent domain was stricken from the bill and was not essential. The General Government and the State already have laws for this purpose under which private property can be condemned for public use.

One objectionable feature is the provision requiring the dams to be actually built before a license can be applied for. But doubtless the engineers, on consultation, can give some kind of assurance as to the nature of the works tbey will accept. There is another thing, too. For years many small mines have continued to work, paying nothing toward the litigation, and leaving the large companies to bear the burden. These small mines will, if this bill passes, come under the law and have to expend money for restraining works also.

While there are, as stated, some features in this hill which are objectionable to tbe miners, they ought to be satisfied that, at last, Congress has listened to them, and gave them some kind of a show to work hydraulic claims. For years they have heen under the han, but if the bill becomes a law they may carry on mining under its provisions. A license from these Government engineers will so fix the miner that he will not be liable to injunction from State or Federal courts; and if he takes care of his debris he can continue to work. This ought to satisfy hoth miners and farmers, and no cranky individual of the latter class can, as now, stop a whole mining section from working. The bill goes to the Senate and Congressman Caminetti will do all he can to aid Senator Felton in urging it there. Even if it does not pass the Senate this session, it may next, and will not have to go back to be considered hy the House again. The bill, thus far, may be considered a decided victory for the hydraulic miners of California.

Asphalt for Reservoirs, Ditches and Flumes.

The abundance of asphalt found in this State has led to its utilization in many ways aside from the usual ones of paving, roofing, etc. Of late it has been considerably used in lining reservoirs and flumes and is found to answer this purpose admirably, taking the place of cement. Reservoirs lined with asphalt are now used in San Diego, Los Angeles, Ventura, Santa Barbara and Kern counties where the material is mined and is very inexpensive. In some places, too, they have lined ditches with brick and covered that with asphalt to prevent loss of water. The asphalt is mixed with sand or gravel, or used in combination with brick or stone as seems handiest. In the irrigation districts of this State this material is liable to enter largely into the works in the future.



CROSS SECTION OF BUILDING AND PANS.

Mr. Farwell of San Francisco recently built near San Gabriel, Los Angeles county, a reservoir of about 100x170 feet in area by some 10 feet deep, using asphalt concrete of three-inch thickness. The composition embraced 92 per cent gravel to 8 per cent pure asphalt from the Sunset oil works of Kern county. The finish was one-eighth inch of hot liquid asphalt. The work was well tamped and rolled smooth.

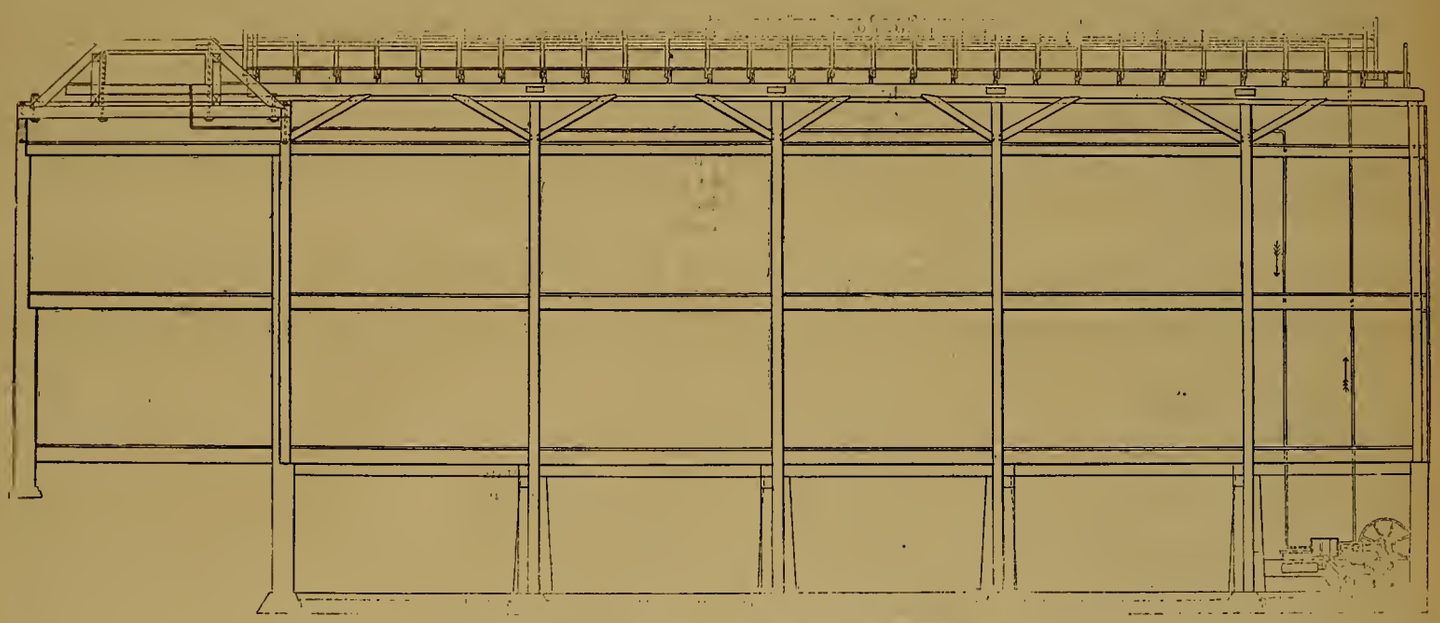
The Las Posas Water Co., near Hueneme, and the Santa Paula Water Co., both have large reservoirs of similar structure which are also giving good satisfaction.

The Kern County Land Co. had a flume, 1800 feet in length, leaking water so badly as to seriously injure the grape vines in its vicinity. A coating of asphalt was applied to the flume so effectually that the same vines now require irrigation in the usual way.

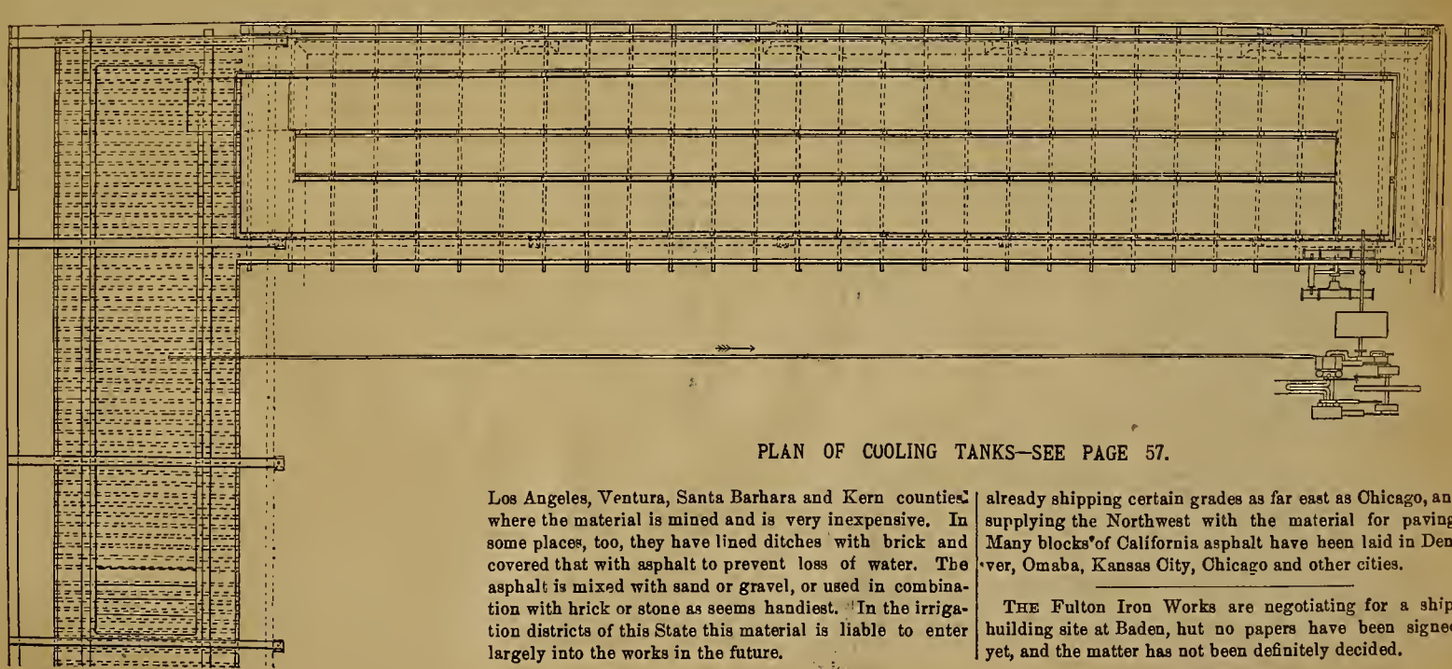
The Poso Irrigation District managers are now building a large flume, some four feet deep by seven feet wide, some miles in length, which will be coated outside and inside by the Standard Asphalt Co. of Bakersfield.

The feature of durability of such work is well established. As asphalt is furnished in a cheaper, more uniform and convenient form for application its use is becoming greatly augmented. By its use, destructive vegetable growth is avoided on both outside and inside of the flume. No unpleasant taste is imparted to the water, which passes with reduced friction, thus adding to the volume of carrying capacity of the flume.

Over 100,000 tons of asphalt were imported to the United States from the Island of Trinidad for the year 1891, about 95 per cent of which was used for paving purposes. California's excellent products in this line should rapidly reduce this great foreign importation. We are already shipping certain grades as far east as Chicago, and supplying the Northwest with the material for paving. Many blocks of California asphalt have been laid in Denver, Omaha, Kansas City, Chicago and other cities.



LONGITUDINAL SECTION OF BUILDING AND COOLING PANS ON ROOF.



PLAN OF COOLING TANKS—SEE PAGE 57.

THE Fulton Iron Works are negotiating for a shipbuilding site at Baden, but no papers have been signed yet, and the matter has not been definitely decided.

"Serpentine Rocks."

Some Geological Facts for the Practical Miner.

SAN FRANCISCO, July 16, 1892.

TO THE EDITOR:—The investigation and study of the group of serpentine or altered eruptive rocks are of the greatest importance to the practical miner, as in connection with these rocks, most of our metalliferous lodes, veins and deposits are met with, yielding metals of the first and second class. For instance, of the former the Idaho mine, Grass Valley, is the richest and deepest paying gold mine on the Pacific Coast. The New Almaden quicksilver is one of the richest quicksilver mines in the world.

Platinum has also been found in the serpentine rocks of the Ural mountains. Of the second class, large deposits of nickel have been found, with chromic iron, etc. In New Zealand the native alloy of nickel and iron was found in small grains or scales in the serpentine.

One fact, and I have never heard of attention being called to it, and which is very necessary for surveyors to know, is that where the rock exhibits the characteristic "serpent" colors, from which it is named, it contains a large proportion of magnetic iron ore, so much so as to attract the magnetic needle, so that compass surveys at such points on the surface or underground cannot be relied upon.

Serpentine is essentially a hydrous silicate of magnesia. When pure, it contains at least two-thirds of silicate of magnesia; but it is mostly impure, through admixtures with silicate of protoxide of iron, argillaceous matter and carbonate of lime and magnesia.

The variation in its color, so marked and plainly to be seen, is due to different states of oxidation of the ferruginous and sometimes nickel matter which the rock contains. Serpentine when heated yields about ten per cent of water.

The minerals which occur as accessories in serpentine are numerous and like those in crystalline schists, with which rocks serpentine is commonly associated, to which, however, may be added bronzite schiller-spar, hematite, both massive and as specular iron, dolomite, calcite, brucite, magnesite, native copper, copper pyrites, copper glance and asbestus. Serpentine seems especially to result from the decomposition of rocks rich in olivine. Prof. Bonney regards the serpentine of the Lizard (England) as a truly eruptive rock, and considers that the sedimentary rocks which surround it had been metamorphosed before its intrusion.

Serpentine for the most part is jointed into irregular massive or gnarled masses, and if bordered by other rocks of a different character and age, no trace is left of its original composition, like the footwall of the Idaho gold mine.

It is reasonable to conclude from the altered condition and jointed structure of the serpentine that no regular fissure of any length is likely to be met with in them, so that metalliferous deposits are only found in those parts where intrusive igneous dikes of a later age have forced themselves through the serpentine, or where it is bordered by rocks of a different formation, the spaces between such rocks or dikes and the serpentine forming fissures, portions of which are sometimes occupied by metalliferous lodes or veins.

The practical miner could hardly select a better field for examination, investigation and instruction, and from which he can so easily obtain information that might save himself and clients very large sums of money, than the serpentine range or belt of rocks between Grass Valley and Nevada City affords. He can select hand specimens from the surface for a very long distance, showing the different stages of alteration in the rock, and also from depth at the shaft, of the St. John mine, the Coe, New Eureka and also at a shaft now being sunk near the Maryland claim.

In a paper read before the London Geological Society, May 22, 1878, by Prof. Bonney, on the "Serpentine and Associated Rocks of the Ayrshire Coast," he says: "In the twenty-second volume of this journal is a paper by Dr. J Geikie on the 'Metamorphic Lower Silurian Rocks of Carrick, Ayrshire. The author endeavors to prove that the rocks of the district, with some few slight exceptions, are of sedimentary origin, a feldspar porphyry being the maximum stage of metamorphism exhibited by the feldspathic rocks of the district. The 'dioritic rocks,' diorite and hypersthenite, both of which are occasionally foliated, are also regarded as of metamorphic origin; and lastly, the compact serpentines, like the altered strata with which they are associated, are truly bedded rocks."

Dr. J. Geikie's paper was severely handled on chemical and mineralogical grounds by the late M. D. Forbes, and Prof. Bonney, after a very careful examination, arrived at the following conclusions:

"It results, then, after consideration of both the appearance in the field and of microscopic examination:

"1. That the serpentine of this district is intrusive, and, like so many others, is an altered olivine rock.

"2. That there is no hypersthene rock, but gabbros of two ages, both of igneous origin—the first extraordinarily rich in diallage, so that it can hardly be called a gabbro; the second much resembling the later gabbro of the Lizard Cornwall.

"3. That the porphyrites of Balerenchan and Pinbain H. M. are true igneous rocks, and very probably remnants of lava flows associated with tuffs or agglomerates.

"4. That several of the rocks into which the serpentine is intrusive are also igneous, and are augitic, not hornblende.

"5. That there are some doloritic and basaltic dikes of later date than all the above.

"6. That Dr. Geikie's conclusions as to the nonigneous character of the rocks of this district are, so far as regards all the above named, unsupported by either stratigraphical, petrological or lithological evidence, the proofs of intrusion being remarkably clear and indubitable, so that this district must be removed from the list of those which have been supposed to favor the theory of the production of pseudo-igneous from stratified rocks by selective metamorphism."

MELVILLE ATTWOOD.

Kern County Oil Districts.

Present Outlook in the Region.

SAN FRANCISCO, July 12, 1892.

TO THE EDITOR.—Looking at the topographical map of California we see one of the largest cultivated valleys in the world, its northern half drained by the Sacramento river, and something more than one-half of its remainder, including the southern half, by a system of rivers and lakes, including the San Joaquin river, which unites the waters from the south with the Sacramento, in the Bay of San Francisco. Traversing the valley northward, the last city met of importance is Redding, the prosperous seat of Shasta county, located on the bank of the Sacramento river, where its bright waters seem fairly to leap into the narrow northern extremity of the great valley of California. Looking southward, the last city viewed in the valley is Bakersfield, the center of a broad area of the richest and most productive soil.

With the most perfect system of irrigation in the United States, abundant supply of good water, the lands of Haggin & Carr, extending for 12 to 15 miles in several directions from the city, have proved remarkably suitable for the cultivation of raisin and wine grapes, and nearly all kinds of temperate and semitropic fruits, nuts vegetables, grain, hay, hops, cotton, etc. This rich land is now fortunately being colonized and sold in quantities to suit settlers on easy terms, and the modest pioneer residences of an incoming industrious and thrifty community of home-builders, is pleasantly noticeable in various directions here and there.

Taking a bird's-eye view we see that the Sierra Nevada and Coast range of mountains unite in forming high, semi-circling backgrounds on the east and south, and west of Bakersfield. A low gap on the east indicates the descending course of Kern river, which supplies the beautiful and abundant water that quickens and fattens the growth of stock and plant life in the rich valley. Along its head waters are rich and lasting mines of precious metals. Fifteen miles south of Bakersfield is the old bed of Kern lake, and thence about nine miles north the Buena Vista reservoir of Henry Miller, (formerly Buena Vista lake,) a shallow basin of water over six miles in diameter.

In the low foothills of the Coast range, ten miles farther southwest, are the now important Sunset oil locations, about 30 miles in a direct line southwest of Bakersfield. The petroleum belt here seems to have an almost exact course from southeast to northwest. Claims aggregating six to eight miles in extent are here located by different companies. Fifteen miles to the northwest is situated another large chain of claims known as the Buena Vista section. In addition to excellent petroleum and rare asphalt deposits, sulphur, gypsum and kaolin are among the probable treasures of the section. The Sunset and Buena Vista locations range only about six miles from the line of San Luis Obispo county. The new railroad being rapidly built, reaching out toward these new oil fields, is backed by by the S. P. Co., and will soon be a substantial aid in the development of this new and promising section. It is being rapidly constructed, some 40 miles in length, to the Buena Vista works, which latter point is a trifle south of an air line, 33 miles west of Bakersfield.

THE INDICATIONS.

Present indications are that Kern will prove at least one of the very best petroleum counties on this coast. So far its most notable oilfields are those known as the Buena Vista and the Sunset. The former, worked over 20 years ago by the Buena Vista Co., had limited reduction works. The main object was to produce illuminating oil, which was accomplished in a limited degree at least. Then Stockton was the nearest city for transportation by rail or steamer; it required over 200 miles of transportation by teams, and of course the enterprise proved a failure after a large outlay by the company. But little work has been done in the vicinity of the Buena Vista deposits since. Lately, however, the Tulare Petroleum and Mining Co. have placed a substantial boring outfit on their grounds. There is an immense ridge of asphaltum deposits situated about two miles southerly from the old retorting works, which, it is thought, must some day prove of immense value. Visiting that section in November, some seven years ago, the writer witnessed, in one of the ravines, during the middle of the day, the singular sight of a natural stream of black oil, a foot or more wide, moving as "slow as molasses" toward the valley below.

THE GREATEST POINT OF SUCCESS.

The Sunset and neighboring claims, which are now attracting the most attention, and upon which recent developments evidently have caused the greatest faith in future oil developments in Kern county, are among later locations, some 15 miles south of Buena Vista, and about 35 miles by road southwest of Bakersfield. The first 12 miles or so of the wagon road route from Bakersfield to these oil fields leads through the rich irrigated lands of Haggin & Carr, now being sold in subdivisions by the California Land Co. The remainder of the way is a very level, hot, dusty plain, although a few years ago 10 or 12 miles of the distance was a rank tule swamp bordering each side of the slough then connecting Kern and Buena Vista lakes.

HAZELTON SETTLEMENT.

The settlement around the Sunset claims is named Hazelton after a favorite son of H. A. Blodgett of Bakersfield. It is expected that a postoffice will ere long be established. There being already a postoffice named Sunset, the change of name is quite appropriate, Mr. Blodgett having been the leading spirit in the late and important development of these oil fields. Himself and partner, Solomon Jewett, form the well-known pioneer banking company of Kern county. They have, from time to time, secured, by purchase, lease and location, what is supposed to be the best portion of the petroleum belt at this point. The latest purchase was that of the original lessee, Chas. Barnard. Their tract now ranges from one to two miles in width and five to six miles along the belt.

The first boring was done for the original Sunset Company by John Hamhleton and sons on what was commonly termed Asphaltum hill, on the Sunset claims, four or five years ago, the result being a product of very black, heavy oil, appearing (except in thickness) very much like the asphaltum varnish in common use. It was nearly three years ago that Blodgett & Co. obtained possession of the Sunset and a few adjacent locations, and went vigorously to work to bore larger and deeper wells, meeting at first with only moderate encouragement.

About two years ago Mr. W. E. Youle was engaged as superintendent to take entire charge of the works. We found him an intelligent man of over 30 years' experience in the oil fields of the United States, having been employed during the last 15 years in Santa Clara county, Newhall, Puente, etc. In fact, Mr. Youle has grown up in the business, and thoroughly understands it practically in its details and most important features.

THE SUNSET WORKS.

At the original Sunset works are situated the boarding-house, superintendent's office and the largest set of wells in the district, some eight in number, within a radius of about 200 feet. These are all connected with one pumping system operated by a single engine. From the oldest well is pumped heavy black oil, which is now being manufactured into asphaltum varnish of good quality. From the hill on which these works are located, and its slopes, is being mined an excellent quality of solidified asphaltum, which is broken into fragments and placed in vats.

With each charge worked a quantity of heavy oil is used to facilitate the reduction of the material into solid blocks. These blocks are molded in wooden boxes containing about 100 pounds. They appear darker and less brittle than ordinary resin. About 14 hours are occupied in making a run. The present works are capable of producing 100 boxes in 24 hours. This material is shipped to Portland, Oregon, also as far east as Kansas City and Chicago, where it is melted and mixed with sand and other suitable substance, forming an excellent and perfectly uniform paving material similar in appearance to the bituminous-rock paving used in San Francisco. Quite recently a trainload was shipped east, showing the demand is good and increasing.

LIGHTER GREEN OILS.

This portion of the location up to date has been the most profitable of any in the county. Recently, however, Mr. Youle has succeeded in developing a fine well of a lighter and green oil on what is known as Section 28, Township 11 North, Range 23 West, Mt. San Bernardino meridian, a little over a mile southeasterly from the Sunset Works. Here is located another steam engine, drilling and pumping plant. The developmeot at this point seems a very substantial one, justifying the belief that the district will be one of the best, most permanent and productive fields on the Pacific coast. Again, northwesterly from the Sunset is another steam boring and pumping plant on what is known as Section 13. Here Mr. Barnard was found handling the drill in boring a large well through sandstone formation at over 300 feet depth. At this place quite similar light green oil is found. In fact, the whole plant seemed besmeared green with the slums and spatterings from the work of boring. The indications were similar for good results to those on Section 28. There was already some development of heavy oil and solidified asphalt on this, the Montverde claim. In our interview (in the early part of May), Supt. Youle reported that the drill had just reached into the oil formations on Section 28. The producing capacity of one well there was already equivalent to 20 barrels per 24 hours of the lighter and green oil of about 25 degrees gravity. The oil at the Sunset claims he considers excellent for fluxing the crystallized asphalt in the melting process for producing material for paving, etc.

The near association of oil so homogeneous to the crystallized asphalt, with both substances in abundant quantities, is a fortunate circumstance. No other flux could be so good in the place of this associated deposit of heavy oil. There are the strongest of reasons for believing that the deposits here are of a lasting nature, and there are no evidences of a reduction by the pumping from the wells.

The simple yet substantial and effective way in which Mr. Youle is operating (by wooden connecting bars and oscillating cams), continuously eight pumps on as many wells with a single engine, seemed quite creditable to his practical genius. Much of the heavier oil at these claims is about ten degrees gravity, and the present capacity in the neighborhood of 20 barrels per day. It is particularly good for varnishes, printing ink, etc., and contains a larger percentage for such purposes than any other found on the Pacific coast.

Mr. Youle considers the evidences very positive for this district, proving one of the largest and most permanently productive oil fields on this side of the continent. Unmistakable evidences of the deposit exist continuously for a distance of over four miles on the belt. The croppings are well defined, without interrupting faults, with strata dipping (as is considered favorable) to the north. The location is superior also in point of the contour and lay of the land. Here the elevation is about 700 feet above the sea with a gradual sloping country for transportation. The most practicable machinery is being used for the actual work to be accomplished. While things are plainly constructed, there is that apparent good common sense pervading the general management which points to success wherever success is possible. The workmen, we have reason to believe, are well provided and fairly treated and paid.

The new well being sunk on Section 13 is located on the northeast corner of the southeast eighth. It was 300 feet deep and looking well. It was considered as well located as that on Section 28, and is supposed to have equally good chances. The indications so far are quite similar, and it is naturally to be expected that better results will attain with the progress of the work on both sections. Several ten-animal (horse and mule) teams are employed to haul the products of these different mills to Bakersfield.

Henry Miller has lately built a narrow-gauge railroad

some 15 miles in length, along the level of Buena Vista lake and south into San Emidio canyon, for transporting rock to face several miles of the artificial embankment now being washed away on the east side of the lake. By shifting six miles of this narrow-gauge track and the construction of a short branch from the S. P. branch from Bakersfield, complete railroad connection could be made on very favorable grades for transportation from the Sunset wells. The Southern Pacific branch mentioned will, within a few days, be used for greatly shortening the wagon transportation from Hazelton. Since writing the above, it should be stated that the well here mentioned finally reached a strong flow of artesian water, which is likely to prove valuable, owing to the scarcity of suitable water for steam and irrigating purposes in the district. Other oil wells will be bored in the vicinity.

STANDARD ASPHALT REDUCTION WORKS.

Adjacent to the S P. R. R. depot at East Bakersfield (formerly Sumner) have been established the Standard Asphalt Company's Reduction Works of the latest and most approved plans. The raw oils are brought to these works for reduction. The plant consists of a receiving reservoir capable of holding 60,000 gallons set in the ground and connected by pipes and pumping apparatus to the storage tank. Thence the crude oil goes by gravitation to the boiler and still, and then through the condenser, which contains 384 feet of 2-inch pipe. A charge of 107 barrels can be treated in about 14 hours. There is suitable apparatus for the production of asphalt varnish and oil for lubricating and fuel. The plant is supplied with improved petroleum-burning apparatus. It seems of the latest and best approved designs, second to none for the amount of work it is intended to do.

Under the able management of Mr. Louis Blankenthorn, the reduction works are operated by F. A. Reeder, a mechanic and operator of experience in his specialty. To the enterprise, pluck and perseverance of H. A. Blodgett, those directly interested in the asphalt resources of Kern county are greatly indebted for the promising developments already made. He has also largely helped to give other important improvements a start to the welfare of the county, and to many of its citizens of wealth, as well as those of moderate means and industry. What has already been done is indicative of more to follow, and we expect far better results to report from time to time. D.

THE Bunker Hill and Sullivan property is the star mining claim of the Cœur d'Alene district. It has one of the crack mills of the West, if not of the world, and more men are employed than in any other mine in that section. Mr. John Hayes Hammond picked out the property and managed to get a lot of friends interested to work it. D. O. Mills, Will Crocker, Perry Belmont, Cyrus H. McCormick of Chicago, Mr. Sloane, Vanderbilt's son-in-law, Creighton Webb and others have stock in the company. They have been getting some first-class dividends from time to time, and everything looked favorable for more, until the present difficulty arose. The property is a rich one in a rich district. Experts have reckoned over $2,000,000 in silver and lead in sight in the tunnels, drifts and ledges. The plant has lately been equipped in a manner almost palatial. The mill's capacity has been doubled, so that it can now easily work out 80 tons of concentrates daily. As it stands, this mill cost every cent of $350,000. There is a very swell little brick office, snugly furnished. There is a suspension cable tramway from the mine to the mill, about two miles.

MINING IN SHASTA.—The Shasta *Democrat* says: There are few men in Shasta county who have a stronger faith in the mineral development of the county than has the editor of this paper. There are few men in the county who have watched with keener interest, for the past ten years, the gradual development of Shasta's mineral wealth, firmly believing that intelligent, practical work, backed by determination and faith, would ultimately prove to the world that Shasta county is incalculably rich in gold and silver-bearing ores. We need not recount the achievements wrought by intelligent mining development since 1886, when, after four years of persistent effort in these columns, new life was injected into mining matters, energy was revived, and new men and outside capital began to take an interest and invest in mining property in the county. The record since 1886 would be commendable to any mining region; still, the development and output ought to be tenfold more than it is to-day. Every practical miner in the county will bear us out in this assertion, and we could to the most skeptical why it is so.

STOCKTON'S ELECTRIC ROAD.—The new electric street-railroad system is now in successful working order, and the cars were run for the first time last week. The complete system has 11 miles of track. At the trial a speed of 12 miles an hour was reached, but the electricians did not attempt to run up to the full speed of 23 miles. The cars are the double-end pattern carrying 28 passengers, and were built in Stockton. The motors are the Thomson-Houston pattern and are noiseless. The roadbed is unsurpassed anywhere, and was laid by H. C. Holmes of San Francisco. The company is composed of H. J. Corcoran, I. S. Bostwick, E. R. Hedges and Joseph Fyfe, all Stockton business men.

SILVERADO.—Interest in Silverado, the recently located diggings in the Gold Basin district, Arizona, continues on the increase. While the first rush from Kingman and vicinity is over, there is every prospect of an invasion from more distant points, but at this particular time such a movement is far from desirable, as it would surely lead to deplorable results, owing to the scarcity of water. At present there is not more than water sufficient for the men and teams now there. An outfit has gone out equipped to sink wells for water, and there is also a proposition on foot to carry water from the surrounding springs into the camp.

Mr. MacArthur's Ideas of the Cyanide Process.

Mr. John S. MacArthur writes from Glasgow, Scotland, to the *Engineering and Mining Journal* as follows:

In the issue of May 21st your readers are favored with an article on this process which, among other things, indicates that you are not quite aware of the extent to which it is now in use. Besides the Robinson, the MacArthur-Forrest process is being operated in connection with the following mines: In the Transvaal, Salisbury, Ferreira, Langlaagte, Champ d'Or, Nigel, Black Reef, Crown Reef, Meyer & Charlton, Juhilee, City & Suburban, May Consolidated, New Primrose, Stanhope and Transvaal Gold (Leydenburg). Though some of the largest in above list were not in full working order, the output for April was 13,500 ounces, at from 600 to 800 fine, and though the tonnage is not definitely given, we know that it was not under 20,000 ounces.

In South Africa the operations have been conducted principally on tailings, though concentrates and ores direct from the mines are also worked. The scope of the process is, however, not confined to African tailings. In New Zealand the proprietors of the MacArthur Forrest process made a contract about three years ago to work the entire produce of the Crown mines. Unfortunately for both parties, the development of the mines did not permit a supply of ore sufficient to keep the plant fully employed; nevertheless, every ton of ore delivered has been satisfactorily worked according to contract, and the Crown Mines Co. has now acquired a more extensive local control and more permanent interest in the process. The Sylvia G. M. Co. has also adopted the process under license and payment of royalty.

It is true that a few trials involving 1 ton 16 cwts. were made at the famous Mount Morgan mine of Queensland, and that the manager did not see his way to recommend the adoption of the process, because in his opinion the operation was too slow, *i. e.*, the plant required for the daily tonnage would be too great. As our extractions were from 91 to 100 per cent with ore crushed to an ordinary degree of fineness, and with a normal consumption of cyanide, the question of chemical efficiency did not arise. The calculation of the manager as to working capacity of plant was based on the working of the experimental lots amounting in all to 1 ton 16 cwts., and did not agree with our experience derived from continuous systematic work.

Naturally, the Mount Morgan Co. was guided by its manager's opinion and no contract has yet been made. There are, however, other mines than the Mount Morgan in Queensland, and from them we have bought, paid for and worked hundreds of tons of their concentrates and sludges (residues from pan amalgamation of concentrates). Some time ago a trial of lots of concentrates from several different mines was made of the MacArthur-Forrest process against pan amalgamation. In every case the difference was in our favor. In one case (lot from the Day Dawn P. C. G. M. Co.) there was some doubt about the accuracy of the figures, the trial was repeated and all figures carefully confirmed with the result that the Day Dawn P. C. G. M. Co. has now adopted the process under license and payment of royalty.

Referring to operations in America, the Gold and Silver Extraction, Mining and Milling Company of Denver is in a better position to give a correct statement of affairs than the "Deadwood papers," which in this matter at least "occupy a position of greater freedom and less responsibility."

Had the proprietors of the MacArthur-Forrest process ever committed themselves to the statement that it would work every ore, you and all sensible people would have classed them with the quack whose pills cure all diseases. What we do maintain is that it is of general application rather than limited—a good, sound, practical, commercial process, with advantages more and drawbacks less than other processes.

The following is a statement showing the work done by the process at the Crown mine, New Zealand:

Statement of 263 tons 7 cwt. of Crown mines ore treated at Karangahake by Cassel process:

	Gold, ozs.	Silver, ozs.
263 tons 7 cwt. contained by assay	425	940
Recovered and sold to the bank	384	664
Percentage of recovery	90½%	70½%

The above ore was ground through a 30-mesh in place of 60, consequently 15 per cent of the ore refused to pass a 60-mesh. Had the grinding been as required by the process, much better results would have been obtained:

	Per ton.
Contents of ore before treatment	£7 0s. 0d.
Balance not recovered	£0 15s. 6d.

Formerly a similar ore treated by battery treatment yielded bullion of the value of £2 per ton.

Huntington Mills in Concentrating Works.

Mr. Wm. B. Roberts, of Queensland, writes as follows to the *Mining Standard* of Sydney, N. S. W.:

With reference to your mention of the failure of the concentrating machinery at Mount Willis (Vic.) to do its work satisfactorily, owing to the sliming of the tin in stamping, it has struck me that the following suggestion might be of some service. I merely wish to point out that as I have not seen or made tests on the ore, it is merely given as a *suggestion* that may, or may not, be of service. I am inclined, however, to think it would.

For the crushing of ore for concentration, where too firm a communication of the particles, *i. e.*, sliming, is a disadvantage, I have found nothing to approach the Huntington mill. The method of crushing by rotary grinding instead of a direct blow, and the very perfect discharge of these mills, specially adapts them for the fine crushing of ores, with the making of very much less slimes than I have ever seen produced by any other methods, and of course the general degree of fineness can be regulated by the screens, as with stamps.

The sand produced by crushing with them, using say 200 holes to the inch screens, is then readily and easily handled by Frue vanners, two Frues to each 3½-foot mill, and where very close work is required, these Frues to be fixed tandem, or head to head, the pulp to be delivered to them from the mill by an overhead Spitzcasten, the Frue nearest the mill taking the coarser part of the pulp, while the finer slimes pass on to the other Frue, the conditions of working, *i. e.*, speed, quantity of clear water, etc., on the two Frues being slightly altered to suit the different class of sand treated by each.

Such a plan carries out pretty well in its entirety what should be one of the fundamental principles of all ore-dressing—that of *sizing before concentrating*.

It is, I grant, somewhat expensive to install all in the first place, but once put in is almost automatic, one man on each shift being able to look after say six mills, while another on the lower floor can as easily look after 12 of these machines.

To quote from my own experience, I have for the past 18 months been running a plant consisting of two 3½ foot and one 5-foot Huntington mill on ore consisting of about equal parts of very hard and very soft stone, containing very fine gold and carbonate of bismuth. The rock that is worth concentrating is classified at the mine, sent to one of the 3½-foot mills, is generally the softer and more decomposed portion, and runs, as delivered in the ore bin, from one-half to one per cent of a friable, earthy carbonate of bismuth, an ore that under the stamps would give 75 per cent of slime. As the gold is fine and has to be saved, before concentrating the bismuth I use screens of 225 holes per inch, and yet the product delivered to the Frues does not run more than ten per cent of actual slimes, the balance being delivered in the even, rounded grains, peculiar to the product of these mills.

The tailings show only the merest traces, while the product runs from 12 to 25 per cent, and can be worked much higher by further treatment.

In some future letter I will, with your permission, have something to say as to the merits of Huntington mills as gold-savers, for I feel assured that these mills only require to be better understood to be more generally adopted.

Health of the State.

How to Avoid a Cholera Plague.

The report of the State Board of Health for the month of June shows that there were 1021 deaths in this State that month, giving a death rate of 1.29 per thousand for the month, or 15.48 per annum. Of these 136 were due to consumption, 58 to pneumonia, 24 to bronchitis, 5 to congestion of the lungs, 17 to diarrhea and dysentery, 33 to cholera infantum, 63 to other diseases of the stomach and bowels, 22 to diphtheria, 7 to croup, 14 to scarlatina, 7 to measles, 5 to whooping cough, 14 to typhoid fever, 3 to malarial fevers, 8 to cerebro-spinal fever, 1 to erysipelas, 34 to cancer, 89 to diseases of the heart, 6 to alcoholism, and 475 to other causes.

The record shows that June was comparatively a healthy month. The death rate per thousand was 1.29, against 1.47 in 1891. There is shown an increase of diseases of the stomach and bowels, but that is expected in summer, when the fruit ripens. Cholera infantum is more frequently fatal during the warm weather. Those diseases which increase the mortuary reports of the winter continue to abate. Smallpox is not reported at all. It is, however, reported epidemic at Washington, B. C., and, although Oregon and Washington lie between us and that point, it may very soon be necessary to place an inspector at the northern boundary of the State to detain any persons showing symptoms of the disease.

The report deals at some length with the onward march of cholera and the futility of trying to guard against it by quarantine only. Common prudence, it says, would dictate immediate attention to private and municipal sanitation, as the dreaded plague can usually be halked by the absence of a polluted soil to breed in and spread from.

World's Fair Notes.

San Bernardino county is contemplating the making of a native salt palace for the World's Fair, using blocks of crystallized salt that measure 12x24 inches, and are perfectly transparent.

The County Board of Education of San Diego County has adopted a resolution providing that October 12th next be observed in the public schools throughout the county in commemoration of the discovery of America by Columbus.

Reviewing the State as a whole, there are 40 counties out of a total of 54 that are engaged in preparing exhibits of their products for the World's Columbian Exposition that opens at Chicago on May 1, 1893. A few of the counties that are at work have not formed local World's Fair Associations, but such counties are included in one of the three district associations in the State, and the preparation of exhibits is in progress through other organized bodies or through prominent individuals. In 32 counties of the 40 there are regularly organized World's Fair Associatioos, and with but few exceptions the collecting and preparing of displays is proceeding systematically and with a satisfactory degree of rapidity.

The Los Angeles World's Fair Committee has prepared a plan of cases for making an exhibit of curios at the World's Fair. The cases occupy a floor space of 20 by 40 feet, the center one being 10 feet high, 30 feet long and 10 feet wide. This is surrounded by counter showcases resting on a three-foot counter, where an attendant can stand as bodyguard over the cases. The cases will be nickel plated, the estimated cost thereof being between $700 and $1000. The committee on a nut exhibit has arranged a plan for a pyramid of glass showcases, covering a floor space of ten by ten feet. On top of the pyramid will be a glass column 15 feet high surmounted with a glass urn. The cases are to be filled with walnuts, the display of grade and quality being made from a front view of the cases, the column being the ornamental feature.

MECHANICAL PROGRESS.

Compounding Locomotives.

The Master Mechanics' Association has recently held its annual session at Saratoga. The master mechanic of to-day is a man intrusted witb great practical responsibility in the mechanical matters of railroad operating, and be realizes that it is better to go slow than go wrong. At the meeting referred to, this was particularly noticeable in the discussion of compound locomotives, of which the *American Machinist* has the following to say:

It is but a short time since compounding has received attention from railroad men. The utility of the compound condensing engine had been strongly disputed, and the war against noncondensing compounds had been more fierce. This was about the status of tbe case when compounding was introduced on some of the railroads of Europe. It had been settled that compound condensing engines were valuable in an economical sense, but the advocates of simple cylinder engines had by no means, and have not yet, given up their contention that there could be no economy in a compound noncondensing engine. It is the trial of these very same noncondensing engines on railroads that brought out, at Saratoga, what was probably the most interesting discussion that was ever had by a body of mechanics in this country.

A committee of master mechanics had been appointed to report upon compound locomotives from tests actually made, and this committee presented a report involving an immense amount of labor. It was the consideration of this report that afforded an opening for tbe able debaters of the association. The committee did not put an exaggerated estimate on its work, and evidently expected it to be criticized by those who had superintended the operation of compound locomotives on the roads under their charge mechanically.

It may seem at first thought, even to mechanical engineers, that the settling of the question of the economy as between a simple and a compound locomotive would be an easy matter. If the determination of this was between two stationary steam engines used for ordinary purposes, the matter would be comparatively simple; but the difficulties of determining the comparative efficiency of two simple locomotives is nearly insurmountable. In point of fact, the actual economic performance of a locomotive working under any conditions has not yet been determined to that degree of exactness that give to the conclusions any of the value of scientific exactness. When it comes to comparing the efficiency of two engines, one a compound, tbe difficulty can hardly be overestimated.

Some of the difficulties may be briefly stated: The run must be made under the ordinary requirements of every-day work. Considering this, it will be seen that the coal must be used as it is used in common practice, and this means an "estimate" at stopping and starting that may be wrong to the extent of a large percentage, considering the capacity of a locomotive fire box. This is one way in which the "estimates" may be widely astray. Then the power must be measured if that plan is adopted, and with the speed of a run varying from nothing to the maximum this is no easy matter; in fact, it is a very difficult matter.

It is for comparatively short intervals of time that tbese calculations must be made, and the probable errors—one of which cannot he calculated upon to counterbalance, in any degree, the other—lead to a distrust of such a method. But even if this was admitted as satisfactory, it would cover only one set of conditions that might be varied on every run. This has led to the very unsatisfactory expression of "train mile" and the like.

It might seem that the proper way to measure the efficiency of a locomotive was by the water used per horse power developed. This is fairly susceptible of measurement, but with the present practice of "picking up" water an element of difficulty is introduced. But assuming that the water used could be accurately measured, this does not cover the question as between simple and compound locomotives, not even if the power developed be accurately measured, for the advocates of compounding claim that the more desirable effect of the exhaust is responsible for a good deal, or all, of the advantages of the compound over the simple locomotive; that is, that the easier exhaust of the compound makes the boiler in effect a larger one, in that steam is generated with less waste of fuel. There is reason in this, because it is well known that, measured by ordinary practice, the locomotive boiler is overworked, and that by the sharp lifting character of the exhaust from the cylinders of the simple engine the fire is destructively disturbed.

There are, it must be admitted, two divergent opinions, one being that by the saving of steam in the cylinders the boiler is made comparatively larger, and hence is worked with better economy. Another is that there is no appreciable saving in steam in tbe cylinders, but that tbe way it is used brings about economy in its production.

Tbe foregoing are only a few statements of the difficulties in the way of a comparative test of compound and simple locomotives. To these might be added the opinions that compound engines should be made for special rather than for general purposes, and the consequent reason for compromising for the variations incident to railroad traffic, and, per contra, that no such allowance should be made; also that there are differences in the boilers in the two types of engines, and various other differences. Altogether it is no wonder that the committee failed to arrive at a definite conclusion, and that the spicy discussion was evolved,

Magazine Guns.

While the Magazine Gun Board is concluding its tests of submitted weapons at Springfield, it is interesting to notice, says the *Army and Navy Register*, that Mr. Very, of tbe Hotcbkiss Ordinance Company, whose residence in Europe has afforded him ample opportunities of watching the ravages of tbe magazine guns epidemic, believes the Springfield single loader is the superior of any of the magazine guns. Undoubtedly half a dozen shots, or whatever the magazine holds, can be fired more rapidly from a magazine gun than from the Springfield rifle. But Mr. Very judiciously observes that the critical period, during which a great rapidity of firing will be important in battle, will last tbree or four minutes, and a soldier can fire more shots in three or four minutes from a Springfield single loader than he can from a magazine gun. Mr. Very also makes the curious but important criticism of the magazine guns, that no soldier in the excitement of combat will count off his shots, and that he will go through the motions of firing at an advancing enemy after he has exhausted his magazine. Even in practice and target firing he believes that most soldiers fire once more than they have cartridges, and amid the noise and excitement of battle, especially in the face of a charge from the enemy, he believes that a large portion of the troops would forget all about the magazines and go on automatically with the motions of loading and firing. Most of the officers of companies that were a few years ago supplied experimentally with magazine guns reported adversely on them. They have with them a careful and intelligent observer fresh from the continent, where all armies are equipped with magazine guns. The investigation now going on is of exceptional thoroughness, and the report of our Small Arms Board will be of great importance; it will probably be conclusive.

LOG-HAULING. — A pulp-manufacturing concern in New York State is employing a very practical and ingenious method of inclined and horizontal log-hauling. The apparatus consists of two sprocket wheels, over which pass an endless detached chain running in a recess at the bottom of a trough and provided at intervals with log teeth. The head wheel is 25 feet above the foot wheel, and the head end of the chain swings and can be raised or lowered to suit the depth of the water. The logs are floated to the haul-up, and as they come around the foot wheel are caught by the chain teeth and carried up the incline at the rate of 25 feet a minute. On arriving at the top they are discharged into a horizontal log haul having head and foot wheels nearly 600 feet apart, the whole being similarly constructed to the inclined haul, the return chain supported by tooth idlers, and a deflecting piece is placed across the horizontal conveyer, by which the logs elevated by the chain are thrown out of the trough and rolled over the side upon long skids. By this arrangement the use of eight or ten double teams and as many men are dispensed with. Some of the logs measure 30 inches in diameter and 50 feet in length, and a 25-horse power engine is found ample for the purpose.

TOOL-SHARPENING BY ACIDS.—It has long been known that instruments and tools, such as knives, shears, scythes and files, which have become blunt by use, may again have a keen edge imparted to them by means of acids, as well as by the common methods of sharpening and whetting. But so far the less usual process does not appear to have met with the favor which its merits deserve. All dilute mineral acids are adapted for tool-sharpening: for example, 10 parts of sulphuric acid hydrate to 100 parts of water. The desired end is more quickly attained if a portion nf the sulphuric acid is replaced by nitric acid. A suitable mixture is: 1 litre of water, 50 grammes of Chili saltpetre, and 60 cubic centimetres of concentrated sulphuric acid. This compound dissolves 1½ grammes of metal within ten minutes from an iron surface of one square centimetre; dissolution is slower where sulphuric acid alone is used. Steel is acted upon in the same manner as iron, with the exception that the process is not so rapid because of the polished surface becoming covered with a thin deposit of separated carbon. It has been sought to strengthen the action of the acids, or, in other words, to shorten their period of action, by attracting the electric resistance of the acid with gas-retort coal or with other metals; but up to the present no substantial advantage has accrued from this method. In order to secure as uniform an acid action as possible, preliminary cleaning of the metallic surfaces, preferably with a soda solution, is recommended.—The Age of Steel.

SCIENTIFIC PROGRESS.

Magnesium Flashlight.

A magnesium flashlight for lighthouses is to be tried at Staten Island by the U. S. Lighthouse Department, says the *Engineering News*. The light is the invention of Prof. J. C. Schirm of Berlin, Germany, and has been tested at Hamburg, where, it is said, it was visible for six miles with the sun shining. The apparatns is 6.56 high and 3 feet diameter. Inside is a bellows through which benzine gas is led, while air is forced througb pumice stone, strongly impregoated with benzine. This benzine gas is then passed through finely powdered magnesium, and passes out of an upright pipe through a small flame, by which it is lighted, and where it develops such an intensity that the apparatus shows a luminosity of about 400,000 c. p. The apparatus is regulated by clockwork. The consumption of magnesium is very small. If a power of 200,000 to 400,000 c. p. is desired, only 0.6 to 1.5 grains of magnesium powder are required. The consumption is from 22 to 55 grains in ten hours, representing a cost of $1.50 to $2.50. The apparatus is not necessarily used with condensers or other optical arrangements or reflectors. If, however, lenses be used, the brilliancy is greatly increased. The great advantage with this light is its ability to penetrate almost opaque atmosphere to a greater extent than any other light heretofore produced. This is a property that is almost lacking in the electric light.

It is estimated that a light of about 80,000 c. p., producing six flashes per minute, would cost $1.68 for ten hours' maintenance. The apparatus itself requires a floor service of five feet square. Observations on apparatus set up at Bremen, Bremerhaven and Hamburg are said to have verified the strengtb of the light and its power to penetrate very heavy fogs. The light at Bremen was observed for 70 miles and gave the appearance of lightning on the northern horizon. The observer could give exactly the intervals at which the flashes followed each other.

Magnetic Iron Rust.

The London *Journal* notes that at the recent meeting at Hobart, Tasmania, of the Australasian Association for the Advancement of Science, Prof. Liversidge, F. R. S., of the University of Sydney, read a suggestive paper on the rusting of iron. The author remarked that in books upon chemistry it is usually stated that iron rust is composed of the hydrated sesquioxide of iron; but on examining a very large number of specimens of rust from many different places, and from iron articles of various kinds, and formed under very varied conditions, Prof. Liversidge has found that in almost every instance the rust contained more or less magnetic oxide. Indeed, in some cases the rust, altbougb presenting the usual rust-brown color and appearance, was, when powdered, practically altogether attracted by the magnet. The specimens of rust whicb first drew the author's attention to this subject were large rust scales obtained from some old tramway metals, which he was led to collect and examine on account of their resemblance to the crust so often present upon metallic meteorites. On crusbing these scales in a porcelain mortar, and testing the dust with a magnet, it was found to be wholly susceptible to magnetism, owing to the small quantity of magnetic oxide present being mechanically inclosed in the rust particles. The production of this magnetic oxide does not seem to have been due to the presence of mill scale, because when bright iron wire, plates, rods, nails, etc., were artificially rusted in many ways with free access of oxygen, in almost every instance a large amount of magnetic oxide was formed. These observations have some practical bearing upon the problem of the preservation of wrought iron structures from rust.

Nonluminous Fuel Gas.

At the last annual meeting of the Western Gas Association, held at Detroit, Mich., Mr. K. Mitchell, of St. Joseph, Mo., read a paper in which he held that there can be notbing done by fuel water gas that cannot be done by the illuminating gas now at hand. One of his arguments against fuel water gas was its lack of odor, which makes the detection of a leak almost impossible. Mr. Mitchell's conclusions are thus criticised by *Light, Heat and Power:* In the first place, it is a matter of slight difficulty to odorize the blue gas. Much of the opinion to the contrary comes from the fact that when this gas was being made at the old Citizens' Works at Lynn, various expedients were resorted to for this purpose, the majority of these being soon rejected as impracticable or too costly. This search for an odorizer arose from a supposed necessity of a patent right obligation and not from any impracticability in the most common method of odorizing. If the fuel gas made at St. Joseph is not odorous, the fault lies with its makers, and, though it will be hard to convince the consumer of any philanthropic purpose on the part of the gas company, should be remedied. With the ease of its remedying, the argument of danger in use falls to the ground.

The heat unit question, of course, is one of importance. Accepting the figures quoted from Dr. Love, showing an efficiency of a little more than two-fifths for the fuel gas, as compared with the coal gas, it seems to naturally follow that tbe fuel gas must be sold at ratber less than this ratio to render its use economical.

In the comparison of costs between heating by coal and heating by fuel gas, Mr. Mitchell takes the price of the gas as sold at retail in St. Joseph—50 cents per 1000 ft. This gives the total cost of gas service as $658.70, against $390 for the correspooding coal service. If the gas be taken at 30 cents per 1000 ft., the former figure shrinks to $429.42, a difference of 10 per cent in favor of coal; while at 25 cents per 1000 ft., the balance turns and the cost becomes $372 10.

We make the calculation upon these bases, because, if noncarbureted water gas, or a nonluminous or slightly luminous gas is to be the gas that shall be sold for general fuel purposes, it must be and will be sold in localities like St. Joseph for not more than 25 cents, net. We do not believe—nor does any one else sincerely think—that a higher rate than this can be successfully maintained. From the state of the art in general, we doubt the saving of the degree of efficiency claimed by the fuel gas advocates, and we have little doubt but that, in their push for business, they have much neglected the sanitary problem.

There is more to be learned in the matter of gaseous fuel than is yet known, but if a nonluminous gas is to be tbe coming fuel, it may be considered as settled tbat :

It will be freely odorous. This is a condition of convenience and popularity.

It will be sold at 15 cents per 1000 ft., or less. That is a condition of necessity.

THE earth passes through the zone of shooting stars, if it may be so called, each year on the 10th of August, and on that night and the two following, if the weather is clear, the observer may count them by the hundreds. These all come from the constellation of Perseus, says Camille Flammarion. "The fact that the earth takes three days to pass through the shower of shooting stars affords a measure of the vast space they occupy," he continues; "the more so as they cross an orbit at right angles to the earth's course. Their orbit is a long one and corresponds with that of 1862."

THE Neuenkirchen method for consolidating shifting sand in water-bearing strata consists in injecting powdered cement, by means of compressed air, steam or water under pressure, into the ground to be consolidated, says the *Colliery Guardian*. The cement is screened in order to free it from lumps and foreign substances, and the powder is taken by an injector, which forces it through a flexible pipe into a perforated tube sunk in the soil to the required depth.

SOME CHOICE Technical Books!

BRANNT.—A Practical Treatise on Animal and Vegetable Fat and Oils; comprising both Fixed and Volatile Oils, their Physical and Chemical Properties and Uses. The manner of Extracting and Refining Them, and Practical Rules for Testing Them, as well as the Manufacture of Artificial Butter, Lubricants, including Mineral Lubricating Oils, and on Ozokerite. Edited from the German and other sources by W. T. Brannt. 240 engravings, 730 pages, 8vo. Price.....$7.50

BRANNT.—A Practical Treatise on the Manufacture of Soap and Candles; comprising the Chemistry, the Raw Materials, the Machinery and Utensils, and Various Processes of Manufacture, including a great variety of formulas. Edited chiefly from the German by W. T. Brannt. 165 Engravings, 677 pages, 8vo. Price.....$7.50

BRANNT.—A Practical Treatise on the Manufacture of Vinegar and Acetates, Cider and Fruit Wines; Preservation of Fruits and Vegetables by Canning and Evaporation; Preparation of Fruit-Butters, Jellies, Marmalades, Catchups, Pickles, Mustards, etc. Edited from various sources by Wm. T. Brannt. Illustrated by 79 engravings in one volume, 8vo, 479 pages. Price.....$5.00

BRANNT-WAHL.—The Techno-Chemical Receipt Book. Containing Several Thousand Receipts, covering the Latest, most Important, and most Useful Discoveries, in Chemical Technology and their Practical Application in the Arts and the Industries. By W. T. Brannt and W. H. Wahl, Ph. D. 78 engravings, over 500 pages. Price, $2.00

CREW.—A Practical Treatise on Petroleum; Comprising its Origin, Geology, Geographical Distribution, History, Chemistry, Mining, Technology, Uses and Transportation; together with a description of Gas Wells, the Application of Gas as Fuel, etc. By Benj. J. Crew. With an Appendix on the Oil Regions and the Geology of Natural Gas in Pennsylvania and New York. By Chas. A. Ashburner. 70 engravings and two plates. 568 pages, 8vo. Price.....$5.00

DAVIS.—A practical Treatise on the Manufacture of Bricks, Tiles, Terra-Cotta, etc.—Including Hand-Made, Dry Clay, Tempered Clay, Soft Mud, and Stiff Clay Bricks, also Front, Hand Pressed, Steam Pressed, Re-Pressed, Ornamentally Shaped and Enameled Bricks, Drain Tiles, Straight and Curved Sewer and Water Pipes, Fire Clays, Fire Bricks, Glass Pots, Terra-Cotta, Roofing Tiles, Flooring Tiles, Art Tiles, Mosaic Plates, and Imitation of Intarsia or Inlaid Surfaces together with Enameling in Polychrome Colors, Composition and Application of Glazes, etc., including Full Detailed Descriptions of the Most Modern Machines, Tools, Kilns, and Kiln Roofs used. By Charles T. Davis. Second Edition. Thoroughly Revised. 217 engravings, 500 pages. 8vo. Price.....$5.00

DAVIS. The Manufacture of Leather. Being a description of all the Processes for the Tanning, Tawing, Currying, Finishing and Dyeing of every kind of Leather; including the various Raw Materials and the Methods for Determining their Values, the Tools, Machines, and all Details of Importance connected with an Intelligent and Profitable Prosecution of the Art. By Charles T. Davis. Illustrated by 302 Engravings and 42 Samples of Dyed Leathers. 824 pages. 8vo. Price.....$10.00

DAVIS.—The Manufacture of Paper.—Being a description of the various Processes for the Fabrication, Coloring, and Finishing of every kind of Paper, including the different Raw Materials and the Methods for Determining their Values, the Tools, Machines and Practical Details. By Charles T. Davis. Illustrated by 180 engravings. 608 pages. 8vo. Price.....$6.00

DAWIDOWSKY.—A Practical Treatise on the Raw Materials and Fabrication of Glue, Gelatin, Gelatin-Veneers and Foils, Isinglass, Cements, Pastes, Mucilages, etc. From the German by William T. Brannt. Illustrated by 35 engravings, 297 pages. Price.....$2.50

DUPLAIS. A Treatise on the Manufacture and Distillation of Alcoholic Liquors. From the French of M. M. Duplais by M. McKenny, M. D. Illustrated by 14 folding plates and several wood engravings, 743 pages, 8vo. Price.....$10.00

FRANKEL-HUTTER.—A Practical Treatise on the Manufacture of Starch, Glucose, Starch-Sugar and Dextrine. Based on the German of Wagner. Illustrated by 58 engravings, 344 pages, 8vo. Price.....$3.50

THAUSING.—The Theory and Practice of the Preparation of Malt and the Fabrication of Beer. By Julius E. Thausing, Professor at the School for Brewers, Modling, near Vienna. Translated from the German by William T. Brannt. Edited, according to the latest and most scientific practice, including the improvements in the brewing of Lager Beer introduced into the United States. By A. Schwarz and Dr. A. H. Bauer, M. A. C.S. 140 engravings, 8vo, 815 pages. Price.....$10.00

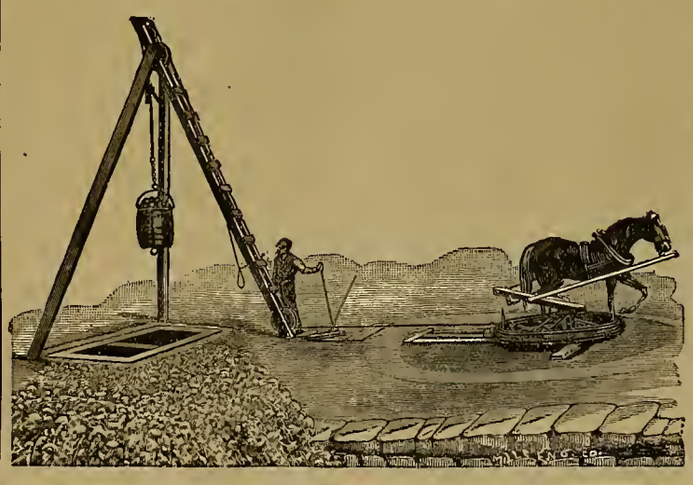
RISDON IRON WORKS PAYS THE FREIGHT.



Common Sense New Steel Whim

All Complete for $125, Freight Prepaid to any Railroad Station in California.

No cog wheels or clutches to break. Ninety per cent of this whim is wrought iron and steel, and will spring or bend instead of breaking, and besides, can be repaired at any blacksmith shop should breakage occur, thus obviating the necessity of sending away hundreds of miles sometimes and waiting a week for repairs. It can be packed anywhere a jack can go, the heaviest piece weighing 300 pounds. Total weight, 800 pounds.

It is just the whim to open up mines in isolated campa where steam power and experienced men are hard to get. With one horse 25 tons can be hoisted 300 feet on each shift. It is just as safe and reliable as an engine. Over 1500 in use, some running eight years without one dollar's expense. We make two, four and eight-horse power whims for heavy mining, also derrick whims and everything pertaining to horse power hoisting.

Buy a good whim and put more money into underground work is the way to open up a mine and make it pay.

For circulars and cuts giving full information, write to

The German Savings and Loan Society,

526 California Street,

FOR THE HALF YEAR ENDING JUNE 30, 1892, A dividend has been declared at the rate of five and one-tenth (5 1-10) per cent. per annum on Term Deposits, and four and one-quarter (4¼) per cent. per annum on Ordinary Deposits, payable on and after FRIDAY, July 1, 1892.

GEO. TOURNY, Secretary

ELECTRICITY.

Electric Tricycle.

The *Revue Industrielle* says that, after a good many trials, a very light and simple tricycle has been made, propelled by electricity. The tricycle is of the ordinary sort, but the saddle is removed, and replaced by a box, the top of which forms the seat for the traveler, while the interior contains a chromic-acid battery and an electric motor, the power from which is transmitted to the driving-wheels by means of cog-wheels and chains. The steering head is controlled by a sort of tiller, and the brake is managed by the feet. The battery is double, composed of two batteries of 18 cells each, connected for intensity, the two separate batteries being then connected for quantity; but this arrangement would naturally be modified to suit the kind of motor used. As with the ordinary tricycle, the electric vehicle is supplied with ball bearings. Including the battery, with cells filled with liquid, the whole machine ready for starting weighs only about 175 pounds, and can carry two persons of average weight over an ordinary road at a speed of 12 miles an hour for three or four hours. At this time the battery declines considerably in force, but will continue to furnish a diminishing power for some time looger. The cost of power obtained from a battery of this sort is considerable. Roughly speaking it would amount to about two cents a mile for materials alone, exclusive of the labor of refilling and renewing the battery. As cyclers would rarely be able on their journeys to stop every four hours and replenish their supply of chromic acid at a village store, we imagine that this mode of locomotion will not be generally adopted at present, and, although the account says nothing about the effect on the ironwork of the machine, or the trousers-leg of the proprietor, of the upsetting of the battery by a sudden jolt, there is reason to suppose that it would be quite deleterious, so that most of us will prefer to wait, before having our wheels supplied with electric motors, until that good time shall arrive, which is probably not so very far off, when light, constant and powerful storage batteries shall be our constant companions, and electricity for charging them shall be "on tap" at every postoffice and corner grocery.

Atmospheric Electricity.

In 1752 Lemonnier observed that the atmosphere usually was in an electrical condition. Cavallo, Beccaria, Ceca and others added to our knowledge of the subject, and more recently Quetelet and Sir W. Thomson have generalized from more careful observations. The main result is that the air above the surface of the earth is usually, during fine weather, positively electrified, or at least that it is positive with respect to the earth's surface, the earth's surface being relatively negative. The so-called measurements of "atmospheric electricity" are really measurements of difference of potential betweeo a point of the earth's surface and a point somewhere in the air above it. In the upper regions of the atmosphere the air is highly rarified, and conducts electricity as do the rarified gases in Geissler's tubes. The lower air is, when dry, a nonconductor. The upper stratum is believed to be charged with + electricity, while the earth's surface is itself negatively charged, the stratum of denser air between acting like the glass of a Leyden jar in keeping the opposite charges separate. If we could measure the electric potential at different points within the thicknesss of the glass of a Leyden jar, we should find that the values of the potential changed in regular order from a + value at one side to a − value at the other, there being a point of zero potential about halfway between the two. Now, the air in fine weather always gives + indications, and the potential of it is higber the higher we go to measure it. Cavallo found more electricity in the air just outside the cupola of St. Paul's Cathedral in London that at a lower point of the building. Sir W. Thomson found the potential in the island of Arran to increase from 23 to 46 volts for a rise of one foot in level; but the difference of potential was sometimes eight or ten times as much for the same difference of level, and changed rapidly as the east wind blew masses of cloud charged with + or − electricity across the sky. Joule and Thomson, at Aberdeen, found the rise of potential to be equal to 40 volts per foot, or 1.3 volts per centimetre rise of level. During fine weather a negative electrification of the air is extremely rare.—Electrical Age.

THE fact that electricity, like heat, light and radiant chemical energy, is a manifestation of energy, has long been known, but up to the last four or five years scientists have been uncertain as to the manner in which energy existed in the electric current. The old idea of an electric fluid, which is still prevalent outside of scientific circles, served to mislead investigators. At present, however, the researches of such scientists as Hertz, Lodge, Crookes, Sir Wm. Thomson and Tesla seem to have established the fact that electricity, like heat and light, is merely a vibration in the so-called "ether" which is believed to permeate all space. It is notable that all the original theories as to what we now call forms of energy, were materialistic. The Newtonian (corpuscular) theory of light, which was the generally accepted one for half a century, was that light was an efiect produced by an incessant fire of infioitesimal but material cannon-balls thrown off in all directions from the light-giving body. Heat was a material something stored in the pores of the visible body. Electricity was a "fluid." All these assumed material substances have been shown to be non-existent, and not necessary to explain the phenomena. But there still remains one grave difficulty with the later theories. The notion of a material ether itself is almost as contrary to what we know of the nature of other matter as the corpuscular theory of light, and almost as much a mere evolution of the scientific inner consciousness, to explain what is otherwise inexplicable. We have not a particle of direct evidence to prove that there is a substance with properties such as we assign to this ether. We have only to eliminate the notion of a material ether, as we have eliminated the notion of material light particles, and we shall be down to hardpan. "I believe because it is impossible," the old monk declared. The modern scientific man, possibly, would do well to reverse this logic and declare: I disbelieve because it is so convenient a theory, with nothing but its convenience to support it.—Engineering News.

THE lead mine at Metteroich, in Belgium, is not only lighted by electricity, but the current is utilized in all kinds of work. The daily quantity of mineral extracted is 3000 tons, and the works operated automatically are so numerous that 25 men are sufficient to do the work. Ooe of the applications of electricity in this mine is new—at least we have not heard it spoken of until now. Each bucket that arrives at the top of the shaft makes an electric contact, and a needle in the office makes a red line upon a band of paper, which is turned by clock movement. This arrangement allows them to keep an account of the regularity of the work, and the number of buckets registered prevents any dispute.

Machinery for Sale

FOR SALE CHEAP.

One 80-H. P. Taylor Beck High Speed Engine in use but four months; 11½x15—replaced on accouot of size by 20 H. P. Bill Engiue, at power house of Santa Cruz Electric Railroad. In first-class condition.

ALSO, The following Second-Hand Steam Pumps:

No 2 BLAKE, 4" steam, 2⅜" water, 5" stroke.

No. 10 HOOKER, 14" steam, 6" water, 16" stroke.

No. 6 THOMPSON & EVANS, 6" steam, 4" water, 10" stroke.

No. 8 CAMERON, 10" steam, 6" water, 13" stroke.

No. 4 DOW, 5½" steam, 3½" water, 8" stroke.

No. 6 DEANE 7½" steam, 5" water, 10" stroke.

DEANE DUPLEX, 6" steam, 4" water, 8" stroke.

WORTHINGTON DUPLEX, 6" steam, 4" water, 8" stroke.

ALSO,

CENTRIFUGAL, ELECTRIC and POWER PUMPS.

ADDRESS

RISDON IRON WORKS,

San Francisco, California.

BACK FILES of the MINING AND SCIENTIFIC PRESS (unbound) can be had for $3 per volume of six months. Per year (two volumes) $5. Inserted in Dewey's patent binder, 50 cents additional per volume.

Educational.

JOHN T. EVANS,
Assay Office and Chemical Laboratory,
ROOMS 46 AND 47 MONTGOMERY BLOCK, 628 Montgomery Street, San Francisco. For nearly 15 years with Thomas Price, as Chief of the Ore-Assay and Analytical Department. Lessons given in Assaying and Chemistry.

School of Practical, Civil, Mechanical, Electrical and Mining Engineering,
Surveying, Architecture, Drawing and Assaying,
723 MARKET ST., SAN FRANCISCO, CAL.
Open all year.
A. VAN DER NAILLEN, President.
Assaying of Ores, $25; Bullion and Chlorination Assay, $25; Blowpipe Assay, $10. Full Course of Assaying, $50.
ESTABLISHED 1864. Send for Circular.

HEALD'S
BUSINESS COLLEGE,
24 POST ST., S. F.
FOR SEVENTY-FIVE DOLLARS THIS College instructs in Shorthand, Type Writing, Bookkeeping, Telegraphy, Penmanship, Drawing, all the English branches, and everything pertaining to business for six full months. We have sixteen teachers, and give individual instruction to all our pupils. Our school has its graduates in every part of the State.
SEND FOR CIRCULAR.

Photographs in Colors.

The method adopted by Mr. Ives for photographing in colors is, says the *British Architect*, another instance of American ingenuity. Acting on Helmholtz's theory, that the nerves of the eye respond to wave vibrations corresponding to light of red, green, and bluish violet, and that all tints are made up of combinations of these light waves, he takes three photographs of a scene or object, screening off from the first sensitized plate all but the red rays, from the second all but the green rays, and from the third all but the blue-violet rays. Then he places the photographs on celluloid obtained from these negatives in a three-lens lantern, and projects these so that they coincide in one picture, screening his lenses with glass of red, green, and blue-violet color. The result is a large photograph in all the actual colors of nature, both landscapes, photographs of pictures or of flowers. A still more striking effect is produced by placing the treble celluloid positives in a kind of stereoscope lantern with prisms, when the photograph of a geranium or other flower stands out with the vivid colors of nature. Of course Mr. Ives' results are very different from the colored photographs often put forward as examples of actinic power, but in which all colors but one are produced mechanically. It is remarkable that M. Lippmann, one of the professors at the Sorbonne, has also succeeded in photographing colors. At the last meeting of the French Academy des Sciences, he exhibited several examples of plates from colored objects, one being taken from the national flag.

MORDANTING WOOL.—The new method of mordanting wool, described at some length in the French journals, is claimed to possess some special advantages as compared with even the methods regarded ordinarily as the most satisfactory. The mordant, according to this description, may be chrome alone or chrome and iron; and from the formulæ given by the inventors, it appears that in the first case chrome alum is employed, and in the second a mixture of chrome alum with ferric sulphate. The peculiar preparation of these reagents constitutes the value of the method proposed. Chrome mordant is obtained by reducing the chromic acid in an alkaline chromate with bisulphite of soda in the presence of sulphuric acid. Thus 296 parts of bichromate of potash, 245 of sulphuric acid, at 166 troy weight, and 147 of bisulphite of soda give 393 parts of chromic sulphate and 174 of sulphate of potash. These two products make two equivalents of chrome alum, and the remaining parts represent a formation of sulphate of soda and water.

A NEAT invention by a Parisian has been applied to the fast express running between Lyons and Marseilles. Heretofore, the railway compartments were marked by numbers, and it was very difficult to see these at night. To find their respective compartments, passengers were compelled to impress upon their minds some unmistakable sign. Pictures of animals and of furniture, tools and weapons now serve as guides instead of numbers. The system has given great satisfaction, and has caused no end of merriment to passengers, who ride in a donkey car or a monkey car, as they style their compartments.

A MANSION in Ayrshire, England, has been fitted by a Paisley firm with an installation of electric light, the power being generated by a turbine running in connection with a six inch pipe having a fall of 27 feet. The water comes from a stream in the estate, and is stored in a dam. The turbine is belted to a dynamo which works in conjunction with storage cells. There are 50 lamps, nearly all of 16 candle power.

GOOD HEALTH.

Education and Vision.

There is no doubt that the weakening of our power of vision is mainly due to education. As M. Motais, of Anger, said in his paper recently read before the French Academie de Medecine, man in his wild state, roaming about open country or forests, is gifted with remarkably long sight. He has to scan the horizon in the dark or under the glare of the sun in order to espy both enemies and prey. Even races who have partly come under the influence of civilization, but remain in the open, such as the Arabs and the inhabitants of Northern and Asiatic Russia, possess astonishing powers of sight. They will describe a black speck on the horizon with peraccuracy to incredulous denizens of civilized States. Not only their comfort, but their very existence, depends on this power of distant vision. The same thing is observed with wild animals. All the larger species are remarkably long-sighted, for they, too, have to scan the distant horizon for enemies and prey, and judge distances, just like the savage man who disputes the sovereignty of the plain and forest with them. M. Motais was anxious to discover if the restricting influences of civilization would affect the eyesight of the larger beasts of prey. He found that the oldest animals occasionally lost their sight altogether owing to overconfinement, but that otherwise their long sight remained. But if the animals were caught young, and secured in the usual cages or dens, these animals having no opportunity of exercising their powers of vision over long distances and wide expanses, grew up short-sighted.—Optician.

Exercise Better than Medicine.

Much of the food actually digested and assimilated is not used to the fullest extent for want of sufficient oxidation to make it yield the greatest amount of vitalizing power to the tissues of the body. Such partially unoxidized products have an irritating effect on the organs and tissues, and predisposes them to disease if they do not directly affect them with it.

Exercise has a stimulating effect on all parts of the body by inducing further oxidation in all the tissues and organs. This increased oxidation is attended by a greater demand on the part of the system for oxygen—as indicated by the greater number, force and frequency of the respirations

During exercise the heart beats faster, and forces more blood through the lungs to all parts of the body, bearing in its little blood cells the precious life-giving factor, oxygen. These little cells—one constituent of which, hœmoglobin, has the wonderful faculty of quickly loading and unloading itself with oxygen—thus act as direct aids to the process of oxidation in the tissues and organs.

It is the combining of oxygen with unoxidized products in the blood that gives to each individual cell its possibility of sustaining life. Any process which increases the oxygen supplied to all parts of the body tends to strengthen the life in each individual cell, and to give it more power to resist disease.

Exercise of all factors does this most effectively, and besides actually producing in each individual cell a greater vitality, it gives a favorable opportunity for the waste products of the tissues to be thrown off rapidly. By thus causing a further oxidizing of certain matters in the blood, it conduces in a double sense to life and health.

Habitual outdoor exercise, with suitable protection from extremes of weather, is the most effective means of prolonging life to old age.—Youth's Companion.

Dewey & Co.'s Scientific Press Patent Agency.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an Illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most *reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free.

BOOKS ON ASSAYING.

BY C. H. AARON.

Part I.—Gold and Silver Ores.

SECOND EDITION—PRICE $1.

This work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist nor the practical miner can mistake his meaning.

The work, like Mr. Aaron's former publications ("Testing and Working Silver Ores," "Leaching Gold and Silver Ores") that have been "successfully popular" is written in a condensed form, which renders his information more readily available than that of more wordy and less conscientious writers. The want of such a work has long been felt. It will be very desirable in the hands of many.

Table of Contents:

Preface; Introduction; Implements; Assay Balances; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assays; Examples of Dressing; The Melting in Crucibles; Scorification; Cupellation; Weighing the Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests for Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.

The volume embraces 130 12mo. pages, with illustrations, well bound in cloth; 1889. Price, $1, postpaid. Sold by DEWEY PUBLISHING CO., Publishers, No. 220 Market Street, San Francisco.

Parts II and III.

Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Etc.

SECOND EDITION—JUST OUT.

Price $1.75.

This book is entitled "Assaying—Parts II and III," and is separate from Part I, and treats of Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Zinc, Nickel, Cobalt, etc.

Table of Contents:

Gold and Silver Bullion; Apparatus; Melting Bullion; Assaying Bullion; Humid Assay of Silver; Gay Lussac's Method; Volhart's Method; Manipulation; Lead Ores; Copper Ores; Tin Ores; Mercury Ores; Zinc Ores; Nickel and Cobalt; Chromium; Bismuth; Arsenic; Antimony; Sulphur; Salt; Note.

One of the methods given for the Assay of Copper is new, original and exact, as is also one of the processes for Zinc.

The book contains 161 pages with illustrations, and is strongly bound in cloth. Much of the original text is replaced by new matter.

Price, postpaid, $1.75. Sold by DEWEY PUBLISHING CO., Publishers No. 220 Market St., San Francisco.

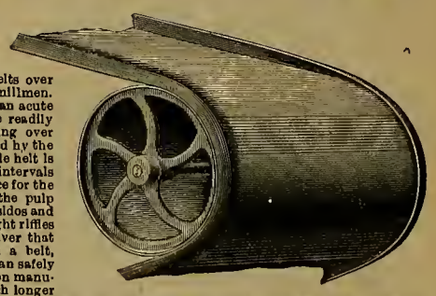
THE BLASDEL CONCENTRATING BELT COMPANY.



We have now made arrangements to have our new Improved Concentrating Belt manufactured in San Francisco. We keep always on hand Belts suitable for the Triumph and Frue machines, but can make any length or width desired. The advantages of these belts over *any others* will be readily seen by practical millmen.

First, the flanges or edges of our belt stand at an acute angle inclining toward the center, and therefore readily conform to the change of direction while passing over the end rollers; thus the vexation and loss caused by the frequent breaking of the flanges of the old style belt is practically done away with. Again, our belts, at intervals of two to four feet, have a very slight riffled surface for the space of three inches, which tends to equalize the pulp on the belt, and prevents it from banking on the sides and forming channels through the center. These slight riffles also save very fine sulphurets and the quicksilver that could otherwise escape with the tailings from a belt, the surface of which is entirely smooth. We can safely say that it is a better belt than has ever been manufactured for use on this coast. It will last much longer and will handle fully one-third more pulp than any smooth belt, and will save a higher percentage of sulphurets

H. G. BLASDEL, Jr., Manager, 419 California St., San Francisco.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned

CALIFORNIA.

Amador.

AT A STANDSTILL.—Amador *Ledger*, July 16: The feeble, half-hearted operations which have characterized the Plymouth Consolidated for a long time past, have come to a complete standstill. Nothing is doing about the mine, and even the taking out of water has been suspended. The mine is consequently filling up with water. The gravel claim at Oleta has come to a sudden halt. The works have been shut down, it is said, for three months. The Goodman mine, at Quartz Mountain, is idle again. It had just been started up, when the death of J. L. Goodman occurred, and the possibility of legal entanglements therefrom led to the shutdown until the title of the property is definitely settled. The Clinton Con. Co., or parties interested in that company, have bonded the old Pioneer and Grieshack claims, in pioneer district, and have started to work prospecting the same. We understand the amount for which they are bonded is $5000. J. R. Tregloan, Supt. of the South Spring Hill mine, says, in an affidavit presented to the Board of Equalization for a reduction of assessment on that property, that the total output of the mine for the past year was $65,300.25, and the operating expenses $79,453.86, showing a net loss of $14,153.67 for the year. The mine and improvements are assessed at $60,000.

WORK SUSPENDED.—Amador *Record*, July 16: Owing to the fact that the Goodwin mine property has been placed in the hands of administrators, work has been suspended altogether. W. G. Whorf recently took charge of the mine, which is located at Quartz Mountain, and the prospects for being able soon to employ a considerable force of men were said to have been flattering. The property is likely to lie idle for some time now, as it may require many months to get the estate settled. Last week the Wabash tunnel, near Amador City, cut a stringer of quartz varying from two to eight inches in width. In appearance it is the same as those encountered before, except that it is livelier in appearance and shows considerable sulphurets, as well as being quite rich in free gold. To all appearances, it is only a matter of a few days when the main ledge will be encountered, and the stockholders feel quite elated over the prospects and will push the work to completion. The work of sinking the Boss shaft at the Belmont mine is going ahead as usual, and they are nearing the 200-foot level. When that point is reached, crosscutting for the vein will begin. Last Monday was pay day at the mine.

Calaveras.

PROSPECTING.—Calaveras *Citizen*, July 16: Sheriff Thorn has been prospecting a batch of quartz from his Illinois mine and finds it well saturated with gold and also extremely rich sulphurets. The shaft is down 100 feet, and gold can be got anywhere in it, the vein being more than five feet in width, and expert miners who have worked in it think well of the prospects for a paying mine; and if worked by intelligent, reliable and experienced management, could be made a paying gold producer. Yet the old adage often comes true that a poor manager often spoils a rich mine, while an able manager will make a poor mine pay and make a rich property. A whim is being erected over the new discovery claim near Copperopolis, one of the Pine Log group of mines, which was found some months ago by expert Brown, and the prospects are all that were predicted for it. The shaft is on the borders of the Justice gold mine and the Royal, and will be sunk 100 feet. Every pound of ore has gold and sulphurets, the vein being over 30 feet wide.

El Dorado.

GENTLA ANNIA.—*Republican*, July 16: The Gentla Annie mine is developing in fine shape, and a large body of good rock has been opened below the tunnel. In driving the tunnel, it cut off a small portion of the upper part of the deposit, leaving a narrow ledge of good rock in the bottom. A shaft was sunk in this tunnel on the vein, which gradually widened till in places it is eight feet across. An upraise has been made vertically to the surface over the shaft, and hoisting works are now being erected to raise the ore to the level of the tunnel, whence it will be run into the mill. On the surface, the Gentle Annie was made up of a large number of quartz seams that seem to have consolidated as depth was reached. A number of other mines in the same belt present this appearance, and it is a matter for congratulation that the developments so far made in the Gentle Annie are such favorable indications of their increased value when worked to the proper depth.

SPECIMAN.—Will Wilkinson made a lucky find one day last week on what is known as the Kennedy place, owned by his father, in the northern part of Placerville. He had been irrigating, and the water had cut a little channel through the soil, in which numerous pieces of float quartz were exposed. While examining these, Will discovered a piece sticking in the hard dirt that excited his curiosity, and, prying it out, he immediately perceived by its weight that it contained gold, and, on washing it, he found that it was almost solid metal, weighing about two ounces and being worth about $30. It is a very nice specimen of pocket gold. There are a number of pocket veins crossing this part of the city limits, and the ravines have contained large quantities of quartz gold. Will has been prospecting one of the seams, and found a pocket on it containing about $30. The piece he found last week was on a level piece of ground, about a foot from the surface, where the soil was about two feet deep. It is not likely that it had moved a great distance from the vein in which it was formed.

Humboldt.

AN OIL WELL.—Cor. *Western Watchman*, July 16: I visited the famous oil well last Saturday. Mr. Gilfillan showed us specimens of the various kinds of rock through which they had drilled. He says he thinks that in going down a distance of 400 feet, they passed through about 50 strata, all of which are hard and flinty and some showing undoubted evidence of silver. The boring continues both night and day. We were entertained with noting the sand brought up, for they are now down a depth of 1100 feet.

AN IRON MINE.—Humboldt *Standard*, July 16: A. W. Anger of Arcata informs the *Standard* that he is prospecting on a ledge of iron ore about two miles from Arcata, and he thinks with the prospect of opening a valuable mine of the finest quality. Specimens of the ore have been sent to the State Mineralogist, who pronounces the ore to be red hematite. He has tried the vein some 200 feet, and it is from six inches to three feet thick, between walls of very hard rock. Should this prove to be a mine of red hematite of sufficient proportions to pay for working, it will add great value to the productions of the county.

Napa.

CUT THE LEDGE.—*Calistogian*, July 16: The lower tunnel of the Knapp Consolidated mine has been advanced 430 feet, and is cutting the ledge obliquely. The rock formation and character of ledge matter are the same as found in the tunnel 150 feet above, which fact is deemed important. Yesterday the ore vein had not yet been cut through. The ore is of very good quality thus far, though better is expected before getting through the vein. Assays are from $15 to $100 per ton of ore. The finding of good ore in the tunnel—which, however, was confidently expected by those interested in the work—insures the advancement of $35,000 more for expenditure on the property. Ben Simmons exhibited specimens of silver ore in town the other day, which had been taken from the Sunnyside claim. He stated that he had been working alone in the tunnel and had cut the vein which had previously been drifted for. It appears to be a prospect worth following up. P. H. Flynn occasionally brings ore to town from the Leopard claim and its extensions in the hills two or three miles northwest of town. He says he has a mine, and will startle the natives, one of these days, with the developments that will he made there.

Plumas.

THE SHENANDOAH.—*National Bulletin*, July 14: From Mr. Whiting we learn that a force of 15 men is now working at the Shenandoah mine. A ditch 1½ miles long is being dug to enable the company to utilize the waters of Mill creek—a fine water privilege the year round. It will be used to run the mill and for mining purposes generally. The mill erected last year will be moved up to the mine, thus saving the cost of hanling ore, which will be dumped into the mill from the mine. Development work continues and with good prospects.

FINA NUGGETS.—From Assessor Sutton, who returned from Mohawk yesterday, we learn that, about ten days ago, Chas. Smith, better known as "Yorky," found a 38-ounce nugget in his mine above old Jamison City. He immediately cleaned up his sluice boxes, from which he obtained about $100 more, went to Downieville, sold his gold, and now is as happy and well dressed as a prince. In his claim, between the head of Squirrel creek and the head of the East Branch of Nelson creek, Ben. Jones found a $600 nugget last week, and he also is happy.

San Benito.

COAL PROSPECTS.—*Advance*, July 15: Upon his ranch on the Cienega road, Mr. D. J. Watson is engaged with a force of men mining for coal. Some time ago he discovered a small vein of coal in one of the gulches on his place. The vein at the surface of the ground was one inch in width. At six feet the vein widened to 20 inches; at 60 feet the vein measures four feet. A shaft is being sunk preparatory to running a tunnel into the hill. Mr. Watson proposes to prospect the property with his own capital. If coal is found in any quantity, a company will be formed to mine and market it. The coal has been tested in some of the local blacksmith shops. It is found to burn freely, but leaves too large a proportion of clinkers. This is due to the presence of sulphur in the croppings, and it is anticipated that when the mother vein is reached, all traces of the sulphur will disappear.

Shasta.

IRON OAA.—Redding *Free Press*, July 16: Last week we had an item relative to the shipment of iron ore. This week we interviewed J. M. Vannoy on the subject, and from him learned the following facts: Several years ago Mr. Vannoy, during one of his prospecting trips, discovered an extensive iron deposit near the gray rocks on Stillwater, one mile above the ranch of J. D. H. Williams, and some twelve miles from Redding. Not long since Mr. Vannoy brought to the notice of the Pacific Rolling Mills of San Francisco his discovery, and as they desired to test the ore, an open cut was made for the purpose of taking it out. Out of this cut, which is but 20 feet long, running from 2 to 3 feet in width and 7½ feet from the surface at the farther end, some 17 tons of ore, going as high as 73 per cent iron, were taken, and we are told that the ledge is opening up in fine shape. There are thousands of tons in sight. Jim Eligh and Preach Ten Eyck did the hauling, and a carload was shipped this week. If this test is satisfactory, the Pacific Rolling Mills will require hundreds of tons.

MINING NOTES.—Some rich ore has been discovered in the Little Nellie mine, assaying over $200 to the ton. The Longfield mine, formerly the Minnesota, located near the Little Nellie on Iron mountain, has discarded a patent pulverizer and will put in ten stamps. We learn that the mine is owned by Chicago parties, and that considerable development has been made. The Shasta Gold Extraction Co. received several lots of ore this week. The samplings proved satisfactory to the miners. There is now no excuse for miners who hold good claims for allowing themselves to lie idle, as the Shasta Co. will buy all that comes and pay the coin for it. There is nothing that has attracted the attention of mining men to Shasta county more than the Calumet Co.'s taking hold of the cyanide process and building it up into practical importance, for every two or three days from one to three men come up on the train and go to the Calumet and Shasta mills to investigate the process. During the past week the mills have been visited by parties from Montana, Washington, Southern California and Nevada. J. H. Morton has been experimenting with the MacArthur-Forrest process and has come to the conclusion that it is the proper process for the Old Diggings district ore. Mr. Morton thinks that the cyanide should be used homeopathically—that is, in a weak solution, just of sufficient strength to extract the gold from the sulphurets. A strong mixture seems to bring into solution the other minerals with the gold and makes the precipitate a conglomeration of metals from which the gold must be separated, whereas the weak solution attacks the gold alone and the precipitate is of greater value. More time, however, is required by a weak solution.

Sierra.

PAYING HANDSOMELY.—*Mt. Messenger*, July 16: The gold yield of the Bald Mt. Ex. drift mine for June was near $13,000. The cleanups for the past six months have aggregated $69,525.40, among which were nuggets varying from one, three, five, ten, twenty-two and thirty-five ounces. The regular monthly dividend, No. 20, of $6000 was declared for the stockholders, July 2d.

NEVADA.

Hawthorne District.

IMPORTANT STRIKES.—Hawthorne *Bulletin*, July 15. Important strikes are reported in the southwestern portion of Hawthorne district. Last week Thomas Jaggers sold a two-third's interest in the Oro Blanco to A. W. Curtis, J. R. Knowles and A. S. Dickerson, and work was at once begun on the mine. The pay ore is about six inches wide and is rich in gold. The Queen Isabelle is probably the best mine in that portion of the district at this time. The ledge is three feet wide, all milling ore, with very rich spots all through it. The working force will be increased this month. Many new locations are being made and it is not unlikely that this will soon be the busiest portion of the district. The new diggings are about 12 miles southwest of Hawthorne. S. L. Hanak of Salt Lake has been inspecting mining property hereabouts for the past two weeks. It is probable his company will make some important purchases in the near future. On Sunday Mr. Hanak visited Garfield with a view of purchasing the tailings of the Garfield Co. Peter Hatton and Charley Box are taking out some good ore from their claim near Alum creek. They will make a shipment next week to the arrastre.

Ferguson District.

MAGNOLIA MINE SALE.—Pioche *Record*, July 15: Mr. John Sevenoaks returned from Ferguson district last Saturday evening. While there he examined the Magnolia claim, and before leaving offered the Fergusson boys and Jerry Manning $35,000 for their two-third's interest in the property. The offer was not accepted and Mr. Sevenoaks returned to town. After arriving here he received word that the boys favorably considered the proposition, and this morning Mr. Jas. Hutchinson went down as agent for Mr. Sevenoaks, with instructions to consummate the sale on the original offer, but at no higher figure.

Pioche District.

LEASE.—*Record*, July 15: A lease has recently been made to Tony Nujent and others on the south contact from the 1100 level of the Yuba, where they will begin stoping ore at once. The lessees expect to do well, as the ore there is of a good grade. The last ore mined in the Day mine shows quite an improvement in value. The fluxing qualities remain the same while the silver contents of all the ore received in June went over 28 ounces in silver to the ton. R. W. Crandall of Ferguson, owner of the South Extension Magnolia claim, which adjoins the Magnolia claim on the south, has sold a half interest in his location to C. E. Holt for $3000. Work on the claim will be prosecuted at once. There is no work yet done on the property, but the Magnolia ledge is supposed to run through the ground, which fact alone fixes its value at this time. In upraising from the 950-foot level in the Yuba, over two feet of solid galena has been encountered. On the 1240 level, east of the shaft, there are three shifts being worked. The ore continues over two feet in thickness and of a good grade. Connections will be made with this level and the 1300 upraise as quickly as possible. The breast on the 1300 east level is still looking well, which proves that the ore chute being developed in this part of the mine is one of the largest ever opened in the property.

ARIZONA.

COPPER.—Prescott *Courier*, July 15: Senator Jones of Nevada has purchased a large interest in the Agua Fria Copper Company, and at a meeting of the stockholders held here yesterday was elected as a director. Mr. Isaac T. Stoddard remains at the head of the enterprise, and expects to soon have the smelter at Stoddard turning out bullion and matte.

A MINING SALE. — Tucson *Citizen*, July 16: Johnny Moran, of Pinal county, who owns an excellent, gold property called the Mammon mine, in the southern portion of the county, has succeeded in making a sale of the same and the money has been paid over. There is nothing like getting into a good mineral country and staying with it.

MINES AROUND MAMMOTH. — Mr. Allyn, of Hartford, Connecticut, has had a bond on the Mohawk mine, which is the first extension east of the Mammoth, and he has been working four to six men on it for the past six months. The parties who own this excellent property are Messrs. John Bauer, Andrew Damm, James Frazier and a Mr. Roberts, of San Francisco. The time of the bond does not expire until the 15th, but Mr. Allyn is so well pleased in every respect with the property that negotiations will be closed to-day. This another mining sale is added to the list of Arizona's acquisitions and a wish that a bountiful success will crown the efforts of the purchasers is universally expressed.

BRITISH COLUMBIA.

SLOUGH CREEK.—Nelson *Miner*, July 7: Dr. A. H. Watt, who had charge of the hospital at Richfield, Cariboo, until it was burned a week or so ago, was in Vancouver on Monday. In the matter of mining, he says that attention for the present is centered on the work of the Ramos Company on Slough creek. This company has an extensive plant on the ground, and is going to conduct a series of borings along the creek. The object of these borings will be to determine the distance to bedrock, the composition of the intervening strata, etc. Awaiting the results of these prospective borings, a great many other firms and individuals who have taken up claims along the creek are resting on their oars. A great many prospectors are now pouring into the country, more in fact than have been known to go in for many years. The grass on the grazing lands never looked better; and coming this way, the tilled land passed through showed evidences of splendid crops to be harvested this season.

COLORADO.

A POSSIBLE NEW CAMP.—*Mining and Scientific Review*, July 16: Creede has six shipping mines, with five others in large bodies of good ore and in good condition to forward large consignments to the smelters. The Amethyst tramway being completed, is bringing down from the Amethyst and Last Chance sufficient ore each day to load 15 to 20 cars. The Del Monte, the latest wonder, if not at the head of the list is very near it in strength of vein matter and value of ore. In some of the outlying districts where prospecting has been active since the snow disappeared, some valuable discoveries have been made. The latest reports are from the vicinity of Cunningham gulch, 35 miles up the Rio Grande from Creede. The mineral is oxidized lead and iron. The surface is comparatively free from wash, with rocks exposed so that prospecting is a very simple matter. The vein which has excited profound interest and will cause a rush to Cunningham if present accounts shall be verified, is said to be 18 feet wide with a pay streak of five feet which averages $225 in gold and silver and 40 per cent lead. It is simply a prospect as yet, but a very promising one. The assay value as just defined is sufficient to induce rapid development.

MONTANA.

AT BUTTA.—*Miner*, July 16: The week in mining circles has been rather quiet, nothing of a startling nature for the better occurring to break the steady rumble of the stamps and the blast of the smelter. A disastrous occurrence, however, was the failure of the Butte and Boston stockholders, to achieve the object for which a meeting was called for the 6th—that of bonding the property to raise $2,500 000 with which to rebuild the burned plant and purchase properties needed by the company in the conduct of its affairs. The Davis estate, or rather the heirs to the estate, are responsible for the failure of the company to take favorable action, yet from all accounts this objection will be overcome and the point carried. Just what the Butte and Boston officials intend to do between now and the 18th, on which date another meeting will be held at Boston, is not known, but it is palpably evident to the Davis people that their stock will be wiped out and work given to the 750 men in this city who are now idle because of their action in refusing to consent to the rebuilding of the smelter. The Butte and Boston people regret very much the necessity for such a move; but, realizing that it is their only salvation, they will do it and let Rome howl. As an evidence that the failure of the Davises to vote their stock with the others is injuring the camp, it may be stated that the only few remaining men the company kept at work after the fire were discharged Saturday evening from the Belmont claim, which the company has been developing in the Parrot addition. "With a greatly reduced force at the Anaconda, the Alice and many other properties about Butte," said a citizen yesterday, "the city and community cannot afford to have an enterprise like the Butte and Boston thrown aside to suit the fears or conveniences of the gentlemen who are so eminently conservative."

AT THE MISSOULA.—An influx of water has caused a suspension of work at the lower levels of the Missoula, but ore is being taken from above. Pumps adequate to handle the fluid will shortly be put in, and sinking will then be resumed. The ore of the Missoula averages about 80 ounces per ton, and is treated at a cost of $16 per ton. The Butte and Boston Co. owns the ground and receives from the lessees a royalty of 30 per cent. Several other parties are leasing on various parts of the claim, and although they have not yet struck the rich shoot, they are making good headway toward it.

TO ADOPT THE CYANIDE PROCESS.—The cyanide process of treating ores is to be introduced at the Southern Cross mine near Georgetown. If it can be made to successfully save the gold of the ore of this property, it will be the means of revolutionizing gold mining in Montana, as 90 per cent of the gold ores are too base to be treated by the common methods.

MARKET REPORTS.

Local Markets.

SAN FRANCISCO, July 21, 1892.

In trade circles business has continued active, with the demand for general merchandise coming from nearly all directions. The more distant points, which are difficult of access in winter, will soon begin to lay in winter supplies, and in the interior the buying is of an assorted character. Fall stocks are coming to hand, and soon samples will be open for inspection. In farm produce there has been continuous activity at good prices in fruit and vegetables. The past week there was more done in cereals, with an advance established, but it will take a still higher range of values to induce much selling. With the bountiful harvest and good prices received, there will unquestionably he better times among farmers, which should bring about more extensive improvements, thereby enlivening every branch of business. Among iron workers there is very little complaint. The general feeling is that of confidence and expectation of much better times. The labor strikes at the East and a general unsettling of business is expected to give our manufacturers and iron workers more business. In the local money market there is an increasing inquiry for funds. It comes chiefly from the agricultural districts, due to farmers storing grain rather than sell at current prices. Bankers do not anticipate any closeness in the local money market, owing to the large increased reserves. Wage-earners and others are putting money in bank rather than invest. This is indicated by the returns of all the savings banks in San Francisco to the Bank Commissioners on June 30th. The aggregate resources foot up $110,936,607, against $101,464,850 at the like date in 1891. The money on hand, and also in the hands of other banks, foots up $3,922,999, against $2,793,486 at the like date in 1891. This large increase in money reserve is made in the face of the loans on realty, aggregating the past fiscal year over $5,000,000 more than they did in the fiscal year ending with June 30, 1891. There appears to be a better feeling in the mining industry. This feeling will be more pronounced if the Caminetti Hydraulic bill should pass the U. S. Senate and then be signed by President Harrison.

SILVER—The market has fluctuated very little the past week, barely enough to induce operating in the market. It looks very much as if Europe is more interested in the English elections, and the probable result of the forthcoming international bimetallic conference, than in dealing in silver bullion or any other speculative commodity or security. At a meeting of the cabinet in last week, it is said to have virtually decided to appoint the following persons as representatives from this country to the conference: Senator Jones of Nevada, Senator Allison of Iowa, Henry W. Cannon of New York and General Francis A. Walker of Boston, four of the five. The entire subject of the date and the place of the conference and the names of the five American delegates, will probably be settled in this or next week.

MEXICAN DOLLARS—The market is quiet but fairly firm at 68¾@69¼.

QUICKSILVER—Receipts the past week aggregate 325 flasks. The market is weaker in sympathy with a shading in prices at the East.

BORAX—Receipts the past week aggregate 1780 ctls, and exports by sea to New York 2446 ctls. The market is steady, with a free movement Eastward. The low freight rates named by sail have induced a nwer rate by steam via Panama.

ANTIMONY—The market is in buyers' favor. New York mail advices quote as follows: 10¾@10¾c for Hallet's and 14@14¼c for Cookson's, according to quantity.

PIG LEAD—The market is dull with quotations more or less nominal. Eastern advices report a dull market with buyers more reserved.

TIN—There was received the past week from San Diego 156 pigs. The market is dull and heavy, with quotations nominally unchanged. New York advices report liquidating sales which cause a heavy market. Plate is weak with a decided falling off in the demand. London cables report a good demand for coke from this city.

IRON—The market for pig is more or less unsettled. The low freights from New York to this port, combined with very low prices at the East are against sellers. The cooper strike is against hoop iron. The Eastern pig iron market has undergone no change for the better. As a matter of fact, weakness is more pronounced at last mail advices than it was at the beginning of the month. Since their cut in prices, the Thomas Company have secured more orders, many of which bad previously been withheld, but the general demand was disappointingly slow. Competitors have sold below the Thomas prices to secure orders. For example, good Southern brands have been put in at $14.50 for No. 1 X and $13@13.50 for No. 2 X, while some Lehigh Valley product, No. 2 X, against which many dealers discriminate, was sold to the extent of at least 200 tons at $13 or $13.25. The extreme top prices on standard brands are $15 for No. 1 X, $14 for No. 2 X and $13.50 for grey lorge.

COPPER—The market, after strengthening to some extent, has fallen back again. The action of the market is disappointing. The production on this coast is light. *Iron Age* reports the New York market as follows: Business in this market has been of very moderate volume. The demand is running hebind previous calculations as well, and the general experience is doubtless disappointing. In some quarters it is intimated that the depression is at least partly due to forced sales made for effect, and that a turn for the better is likely to he made ere long, but that consumers' purchases are disappointing is patent, however, and that fact is not without effect.

COKE—The market for shipment is reported unchanged, but for spot it is very weak with a large consignment on the market. It is said that a copper company which had a stock here and to arrive of 4000 tons has been and is still selling.

COAL—Imports the past week aggregate as follows: Coos Bay, 1600 tons; Departure Bay, 4512; Newcastle, N. S. W., 1844; Sydney, 2835; total, 9791 tons. Australian advices report freights higher which causes more to he asked for shipment. English coals are unchanged. The supply of coast promises to be very large. The consumption is enlarging hut the supply on spot and to arrive is large.

Mining Share Market.

SAN FRANCISCO, July 21, 1892.

Mining shares the past week were stale, flat and unprofitable. If it had not been for a few cross-orders on eacb call there would not have been enough business to have given quotations. Even in cross-orders, business was at so low a point that at one session there were not a dozen different mines in which sales were reported. It is a tiresome game for those who are long on the market, when they see that at every little upmove the market falls back to lower prices than before the advance. It is no wonder they feel discouraged and are losing faith in the long-talked-of deal, which now appears to he as far off as ever. There are only three things which can be looked for with the utmost confidence, viz., assessments, the spiriting away of the hulk of the hullion product and a large number of poverty-stricken persons, reduced to that condition by the high-handed way in which the mines are managed—and there are those who call it sharp business sagacity. Cappers' and tools', who continue to make excuses for the stock pools and mill rings, chief stock in trade is that there is no ore in the mines on which a deal can he made. If these camp-followers believe such reports, then the sooner they quit the business the better; but if they circulate them so as to work into the hands of inside rings, then their action is inexcusable. A man who will do dirty work for another, lacks only the opportunity of doing dirty work for himself, and therefore should he and doubtless is, closely watched by those for whom he works. It is on the same principle that a man who steals for another will steal for himself. There is not the least doubt but the rings can show up on the Comstock, whenever they desire to, two or more bodies of ore rich in gold, hut they appear to he playing a waiting game, and in the meantime get outsiders to sell out their shares by disgusting them with assessments and the dismal owlish croakings of paid cappers and tools.

The high grade ore (gold hearing) that is being developed in two or more of the mines on the Comstock appears to have been marked for looting, hut it now looks as if the rings were afraid to commit any more overt acts, for members of the Mining Stock Association and members of the Brokers' Combine are too watchful. It looks very much as if, fearing to misappropriate hullion, the rings have resorted to legalized, to a certain extent at least, methods (assessments, etc.) of robbing outsiders of their long held shares, so that when compelled to show up the ore the public will have very few shares in the mines. Evidently the rings see the handwriting on the wall and are setting their sails accordingly. The decision of Judge Hebhard of the Circuit Court in this city in the suit of M. W. Fox against the directors of the Hale & Norcross Mining Co. has done no little in awakening persons directly to the wrongs which are being perpetrated. This feeling is not confined to this Coast, as is shown by the following excerpt from a leading financial paper at New York city: The New York correspondent of a Philadelphia newspaper writes: "The traders here are placing considerable reliance upon the convention at Helena, Mont. Lawrence V. De Foreest, who is the delegate from New York, is under instructions to lay before the convention certain plans which it is thought will tend to create activity in the market. Trading has been so light of late that the brokers and speculators have been almost discouraged, hut Mr. De Foreest thinks that better times are near at hand. At the meeting of the Board of Directors of the Consolidated Exchange, at which he was chosen delegate, a resolution was adopted that he advocate rules for the prevention of dishonesty on the part of owners and officers of mines. Said Mr. De Foreest: 'I am confident that if we can put a stop to the systematic deception which is being practiced upon the public, the market will he rescued from the lethargic condition which has so long prevailed. There has been so much dishonesty that it is no wonder that the great majority of the people are unwilling to have anything to do with mining shares. There will be some pretty plain talk at the Helena convention, and if some abuses are not remedied it will not he my fault.' The Exchange managers are very confident that Mr. De Foreest will be very outspoken at Helena."

The street is full of rumors pro and con nn the mining situation, with the general opinion among the better informed that the secret work which has been carried on with more or less energy the past three years has placed it beyond the question of a doubt that the west or red lode is richer in gold-hearing ore than was claimed by many. It is doubtless this knowledge which causes chronic hulls, who operate in shares on the condition of the mines and not the situation of the share market, to willingly pay assessments. Late and seemingly reliable advices from the Comstock mines report that in Mexican the work is of a very interesting character, as it is in Ophir. In the joint Union-Sierra Nevada west drift every indication points to the early tapping of the west lode. In Hale & Norcross active prospecting work is under way on or about the 1800-foot level to tap the downward continuation of the rich ore found above to the west. On the 1950-foot level in Con. Virginia a body of high-grade ore is being developed. In the Gold Hill group of mines it looks as if the work which is now being publicly given out, ought to show up some rich ore at an early day. The work that is being pushed in the Alta group, and also that in the Occidental mine, deserves close watching—it is very important. In the outside mines the news begins to grow more interesting; this is doubtless due largely to the fact that the public holds very few of the shares.

Complimentary Samples.

Persons receiving this paper marked, are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal and making its valne more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, $3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber please show the paper to others.

Eastern Metal Markets.

NEW YORK, July 20.—The following are the closing prices the past week:

	Silver in London.	Silver in New York.	Copper.	Lead.	Tin.
Thursday	39¾	86¾	11 25	4 10	20 70
Friday	39¾	86¾	11 25	4 10	21 00
Saturday	39¾	86¾	11 25	4 10	21 80
Monday	39¾	86⅞	11 25	4 10	20 80
Tuesday	39¾	86¾	11 35	4 05	21 65
Wednesday	39¾	86¼	11 35	4 05	21 65

Tin is weak at the decline. Lead is slow and heavy. Quicksilver is lower. Pig iron is unsettled and lower. Copper is barely steady.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR THE WEEK ENDINO JULY 12, 1892.

478,903.—FRUIT GATHERER—S. E. Bsll, Winters, Cal.

478,910.—TRAP FOR CABLE CONDUITS—Bishop & Bell, S. F.

478,911.—CABLE GRIP LIFTER—Bishop & Bell, S. F.

478,915. — BRICK MACHINE—W. Burkman, S. F.

478,922.— AMALGAMATOR—Connors & Eddy, Grass Valley, Cal.

478,932.—LINK LIFTER—John Finney, Portland, Or.

478,854.—GRINDINO WHEEL ATTACHMENT—J. H. Goetsche, S. F.

478.593.— WINDOW FRAME — W. T. Gregg, Lakeport, Cal.

478,872.—VAOINAL SYRINOE—J. D. Kirkwood, Pullman, Wash.

478,875.— ROPE-DRIVINO APPARATUS — Macdonald, Williams & Hitzeroth, S. F.

478,886.—SAW SWAOE—A. L. Navone, Calistoga, Cal.

478,968.—ELECTRIO MOTOR—H. F. Ong, Newbnrg, Or.

478,766.—RAILWAY RAIL—J. T. Smith, S. F.

478,773.— CABLE RAILWAY GRIP—C. Vogel, S. F.

21,703.—DESION FOR MEDAL—Quinby & Bates, Fresno, Cal.

The following brief list hy telegraph, for July 19, will appear more complete on receipt of mail advices:

San Francisco—Edgar Badlam, air-supplying device for gas machines; Lafayette E. and A. E. Bowser, stepladder; Joseph Bertrand and George Fleischel, lock; Joseph C. Ingram, copying device; Samuel E. Murray, rope-guiding sheave; Paul Seiler, alarm-signal apparatus; William A. Woods, water gauge.

California—Charles Johnson and O. Olson, San Jose, cultivator; Theodore W. Lenzen and L. Heckenroth, San Jose, blacksmith's forge; Malcolm MacLeod, Los Angeles, agricultural implements; Lavolser Moreland, Ogilby, amalgamator and ore concentrator; George A. Stephenson, Los Angeles, suspension truss hridge; Edward Thomas, Los Angeles, can stand.

Washington—Marvin G. Calcut, Seattle, elevator; Ernest R. Denny, Spokane, csse for exhibiting needles; Charles H. Dow, Ellensburg, dump car; James R. Lutgen, Wenlock, boiler; Charles Morgan, Latah, can opener.

Nevada—Samuel Emrich, Reno, railway signal.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible (by mail for telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

LIFTINO MEOHANISM FOR CABLE-GRIPS. — Ira Bishop and Arthur F. Bell, S. F. No. 478,911. Dated July 12, 1892. In the operation of cable roads it is often necessary to remove the grip from the tuhe or tunnel, which removal is effected through openings or traps in its top and located at suitable intervals throughout the length of the road. This invention provides a means for lifting the grip out of the tnhe and lowering it again when required. The grips are quite heavy and cannot be handled readily by one man under ordinary circumstances. This patented mechanism provides a simple and effective means for handling the grip, hoth in raising and lowering.

BRICK-MAOHINE — Walfrid Burkman, S. F. No. 478,915. Dated Jnly 12, 1892. This is one of that class of machines for compressing plastic material into shape, in which opposing plungers operate npon the material which is delivered to the mold by a reciprocating feed-

CALIFORNIA
State Mining Exhibition
AT
THE STATE FAIR OF 1892,
TO BE HELD AT
SACRAMENTO, SEPTEMBER 5th to 17th,
PRELIMINARY TO THE GREAT COLUMBIAN EXPOSITION AT CHICAGO NEXT YEAR.

THE INTENTION OF THIS EXHIBIT is to show mining, as far as practicable, in all its various branches.

A space comprising nearly 30,000 square feet will be devoted to the exhibition of all kinds of Mining Machinery, appliances, and miners' supplies.

A COMPLETE FIVE STAMP MILL will be in actual operation, Also a LARGE ELECTRICAL PLANT showing the appliance of electricity as a motive power.

THIS DEPARTMENT OF THE STATE FAIR will he a distinctive mining display, the first ever witnessed in the history of the State, and is intended to promote interest in this most valuable industry.

All patentees and manufacturers of mining machinery are invited to show their appliances, either in model or actual size.

TRANSPORTATION FREE.

FOR FURTHER INFORMATION apply to W. G. SCOTT, Sup't of Exhibit, Office, 22 Montgomery Street, San Francisco, Cal.
Or to G. M. MOTT, Chairman Mining Exhibit, Sacramento.

THIS EXHIBIT IS MADE UNDER THE AUSPICES OF THE STATE AGRICULTURAL SOCIETY, and will receive every assistance possible from said Society to promote its success.

FREDERICK COX, President. EDWIN F. SMITH, Secretary.

box. The invention consists essentially in plungers the movements of which are so timed that the material will be compressed partially from one side, then more forcibly from the opposite side to a plane beyond its center, and finally again, and fully compressed from the first side. The object is to provide a macbine of this class especially for making bricks, in which the pressnre shall be applied to the material in the most effective manner to obtain an equal and general compression throughout the mass, thereby making a snperior brick.

FRUIT GATHERAR.—Samnel F. Ball, Winters, Yolo Co. No. 478,903. Dated July 12, 1892. The fruit gatherer is one of that class in which is employed a receiver adapted to be fitted around the tree-trunk and catch the fruit which is shaken down. The object is to provide a gatherer of this class adapted to be easily transported from tree to tree, to be adjusted in various positions to snit different trees and the lay ot the gronnd, and to be readily and quickly set in place under the tree.

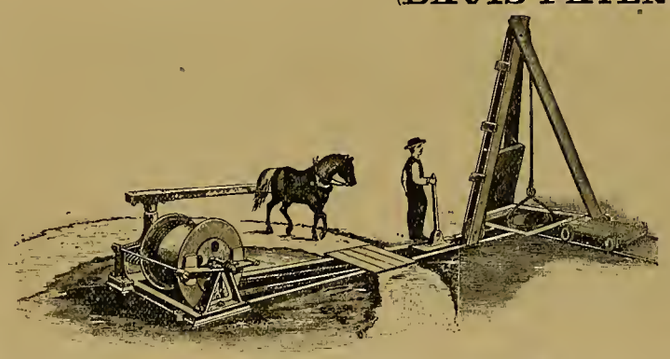
AUTOMATIC TRAP FOR CABLE CONDUITS.—Ira Bishop and Arthur F. Bell, S. F. No. 478,910. Dated July 12, 1892. It is usual in cable railways to provide openings in the top of the tube or conduit at suitable intervals, through which the grip can be removed and replaced. The necessity for nsing these openings has not heretofore been very great, because the reasons for removing the grip have been few, such as to readjust or repair it. Consequently, the doors or covers of the openings have always been manipulated by hand; but in some roads the grip has to be removed oftener and for other reasons, as, for example, where there are sections of the road over which the car travels by gravity and there is no need to keep the grip in the tube, or, in fact, where there is no tube at all. In such cases, therefore, the grip has to be removed and replaced—it may be several times each trip. It then becomes of importance to provide means for easily uncovering said openings, and it is the object of this invention to provide such means. This object is attained by the provision of means for automatically accomplishing the result, which result is due to the arrival of the car itself at the point where it is necessary to uncover the tube or tunnel. There are suitable connections actuated by the car to operate the doors or covers to expose and close the openings.

ENVELOPE OPENER.—Wm. D. Rogers, Alameda, and Jay D. Van Buren, S. F. No. 478,889. Dated July 12, 1892. This device for opening envelopes consists of a triangular or trapezoidal card placed in the envelope and having a small cord attached to its upper acnte angle projecting through the side of the envelope so that it may be pulled. The edge of the card then acts like a paper knife to cut the end of the envelope smoothly and the card itself serves to carry printed or advertising matter of any description.

SAW SWAGING DEVICE.—A. L. Navone, Calistoga. No. 478,886. Dated July 12, 1892. This is one of that class of swaging machines in which, by lever mechanism, the tooth is operated upon between a swage cam and an opposing anvil. The invention provides a simple, powerful and readily adjustable saw swager, in the operation of which the teeth will he sharpened as well as swaged.

MINING AND SCIENTIFIC PRESS. The Leading Mining Journal in America. Established 1860. Lateet Discoveries in Science and Improvements in Mining and Mechanic Arts illustrated or described. A Standard Illustrated Weekly published at $3 a year by DEWEY PUBLISHING CO., 220 Market St., San Francisco, Cal.

JOSHUA HENDY MACHINE WORKS,
NO. 51 FREMONT STREET, SAN FRANCISCO, CAL.
BUILDERS OF
"Sensible" Horse-Power Hoisting Whims.
(DAVIS PATENT.)



PRICES REDUCED.

The "Sensible" Hoist is the cheapest and beyond doubt the best in the market. It is built entirely of iron and steel, mounted on a heavy iron base plate, and is therefore very durable and not affected by exposure to climatic influences.

The bevel gear on the drum shaft is loose, and, in hoisting, drives the drum through a friction clutch. This avoids the frequent accidents occurring with other Whims, occasioned by the breaking of the gear teeth when throwing them out of gear. In lowering, the drum is pressed by a powerful screw lever against brake woods at the opposite end Perfect means of adjustment are provided for the friction clutch and brake blocks.

As the drum is entirely independent from the driving gears the operations of hoisting, dumping bucket and lowering can be performed with the horse in constant motion, a feature not possessed by any other horse hoist in the market, and one that greatly increases the capacity of the machine by avoiding the lose of time due to stopping and starting the horse.

It is very light and compact and very easily taken to pieces for transportation by mules. The cost of erection is very small, two men in half a day being able to put it in place ready for work.

Weight of hoist, 1200 lbs. Total shipping weight, including sweep, levers and sheaves, 1400 lbs.

Circulars giving Capacities and Prices furnished on application.

NOTICE OF ASSESSMENT.

CALIFORNIA VERDE ANTIQUE MARBLE COMPANY Location of principal place of business, San Francisco, California; location of works, Placer County, California.

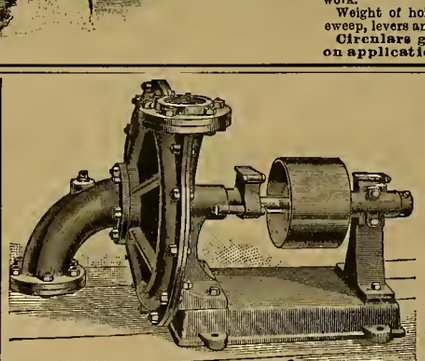
Notice is hereby given that at a meeting of the Board of Directors, held on the 12th day of July, 1892, an assessment (No. 2) of One Cent per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the Company, 3 8 Pine street, San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the 22d day of August, 1892, will be delinquent and advertised for sale at public auction, and unless payment is made before, will be sold on MONDAY, the 12th day of September, 1892, to pay the delinquent assessment together with costs of advertising and expenses of sale.

By order of the Board of Directors.
W. J. GURNETT, Secretary
Office. 3:8 Pine Street, San Francisco, California.

DEWEY
ENGRAVING COMPANY
Make the best of Photo-Engraving Relief Printing Plates, Fine Zincographe, Wood Engravings, Society and Business Seals, Negatives, Blue Prints, Photo-Lithographic Transfers, Magic Lantern Slides and other Special Photographing, and nearly all kinds of Engravings. Our Photo-facsimile or
HALF-TONE ENGRAVINGS
By our New Secret Processes, are unsurpassed by any others. Prices Uniformly Reasonable. Send for Samples and Estimates. 220 Market St., San Francisco.

Postmasters are requested to be sure and notify us when this paper is not taken from their office. If not stopped promptly (through oversight or other mishaps) do us the favor to write again.



IMPROVED CENTRIFUGAL PUMP.

SAN JACINTO ESTATE, LIMITED,
Office of General Manager,
P. O. Address, South Riverside, San Bernardino Co., Cal.
CAJALCO, Dec. 18, 1891.

MESSRS. ADAMS & CARTER, 132 Market Street, San Francisco, Cal.—GENTLEMEN: After a continuous trial of different concentrators comprising the Frue Vanner, the "Holland," "Paradox," "Triumph" and the "Woodbury" concentrators), extending over several months, we find that we prefer the Frue Vanner, as it is easier of adjustment, runs smoother, has less wear and tear, and—having a positive travel—gives less trouble than the other more complicated and ever changing machines now in use here. The Frue Vanner not only saves a cleaner concentrate, but has less loss in the tailings, and is in several ways preferable to the other concentrators here.

I am, my Dear Sirs, Yours faithfully,
S. HARRIS, Manager.

Price of 4-foot wide Plain Belt Frue Vanner..... $550, f. o. b.

James Clayton.

We present herewith a recent portrait of James Clayton, proprietor of the Clayton Air Compressor Works, Brooklyn, N. Y., whose name is widely known throughout the engineering profession on account of the celebrated machines, to the perfection of which he has devoted almost a lifetime. Mr. Clayton comes of an old English family, and was born in Homer, Eng., in the year 1822. He came to thie country in 1849, and proceeding to California, via Panama, located eventually at Grass Valley, Nevada county. There he acquired the Scadden Flat or Clayton Diggings, as afterward known, which he operated several years and finally sold, going East and settling in the city of Brooklyn, where he began the manufacture of the Clayton Fly Wheel steam pump, of which he was the inventor and patentee. These pumps met with a wide sale, until the advent of the direct acting pump, when Mr. Clayton turned his attention to the study of pneumatic machinery, realizing that this branch of mechanics had been too long neglected and that the air compressors then on the market were most primitive.

The first Clayton air compressor was built in 1873, and was used in building the tunnels in New York City for the sunken tracks of the Harlem Railroad, and achieved great success. Since that time, Mr. Clayton has been carefully and steadily making improvements on his compressors, and continually raising the standard of efficiency, until to-day the machines bearing his name are synonyms for excellence in pneumatic machinery, large numbers of them being at work on this coast. Mr. Clayton, now in his seventieth year, is as hale and hearty as a man ten years his junior, and notwithstanding the lapse of time since he left here, his portrait will be recognized by some of his old-time friends. Mr. Clayton has recently departed for Europe to spend a well-earned vacation, visiting his brother, Mr. Thomas G. Clayton, superintendent of the Midland Railway, and traveling on the continent.

JAMES CLAYTON, DESIGNER OF AIR COMPRESSORS.

GOVERNOR MARKHAM has been presented with a very handsome gold match-box by the Executive Committee of the Miners' Association. On the back of the match-box is the inscription: "Presented to Governor Markham by the Miners' Association of California. J. H. Neff, president. S. K. Thornton, vice-president. W. C. Ralston, secretary. Taken from Gould & Doolittle mine, May 28, 1892." Accompanying the presentation was a set of resolutions thanking the Governor for his efforts in the interest of the miners.

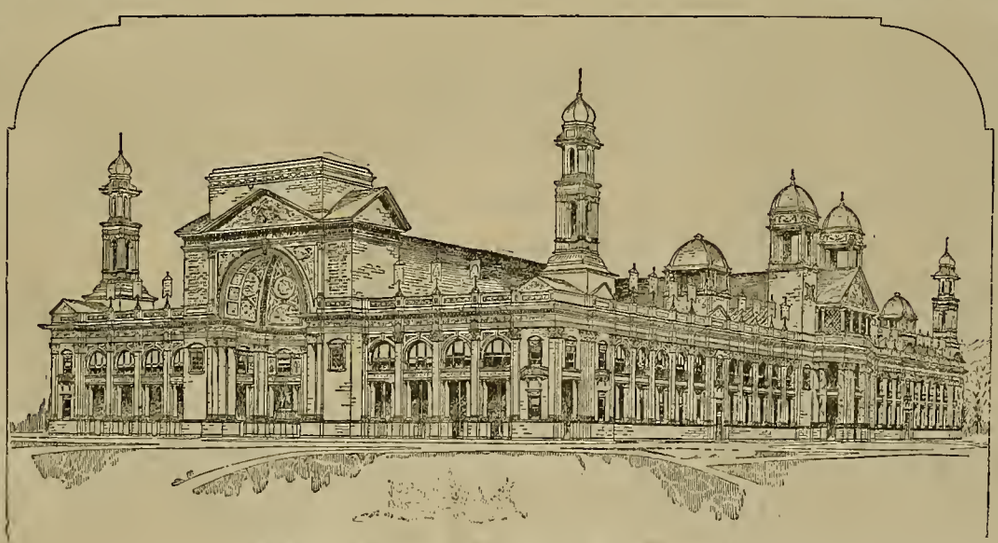
JOHN F. DAVIS of Calaveras Co. defeated Grove L. Johnson of Sacramento for the Republican Congressional nomination in the Second District. Mr. Davis is an energetic young man who is very friendly to the mining industry, and would do all he could to help it if elected.

THE East Side Miners' Association has been organized in Shasta county to promote the mining interests on the east side of the Sacramento river. Meetings will be held on the last Saturday of every month at Old Diggins. The miners of that district with those of Buckeye and Churntown compose the organization. The revenue from dues will be used mainly to advertise the mining interests of the East Side. Mr. H. D. Rippeto, Supt. of the Walker mine, is president and S. S. Stickley of Newtown is secretary and treasurer. This organization should be able to accomplish a good deal for the region referred to.

The Electrical Department of the World's Fair.

The primary object of the electrical department of the World's Fair is the demonstration in actual operation of the commercial and economic application of electricity. It is desired, moreover, to make exhaustive tests of electrical apparatus in all possible directions, with a view to establish the actual efficiency of the same in comparison with other and older methods of accomplishment. In addition to these practical features, it is contemplated to present object lessons of interest and instruction, showing the development of the science from its formative or initiatory state to the present time. The accomplishment of this object will take the form of a historical exhibit embodying models, drawings and crude machinery made and used by pioneers in the science. Every possible field of electrical work will be liberally considered, and all systems of all countries will be placed as favorably as possible, to the end that the best results may accrue to the electrical people and the public at large.

The electrical building, of which an engraving is shown on this page, is designed to contain the entire electrical exhibit of the fair. It is 700 feet long and 345 feet wide, its length being from north to south. The general plan is a longitudinal nave 115 feet wide and 114 feet high, crossed by a transept of the same width and height. Longitudinal galleries will extend along either side of the building, 115 feet wide, at a height of about 30 feet above the main floor. These galleries will be connected by narrow galleries at either end supported by trusses.



THE ELECTRICAL BUILDING FOR THE WORLDS' FAIR.

THE discovery of gold in California was made by James W. Marshall, who found a little nugget in the tail-race of Sutter's mill at Coloma. The original nugget has been for many years in the Safe Deposit vaults in this city, but every one will now have a chance to see it, since it will be taken to the California State Mining exhibition at Sacramento next September.

THE Ely Mill and Mining Company at White Pine, Nev., has just completed cyanide works at its mill. It has put in four tanks of 30 tons capacity each. A tramway with a car attached is rigged up with water power to carry the tailings from the dumps to the tanks. High up above these tanks is the cyanide tank, which is connected with the other tanks by a pipe. This is so arranged that it can be used on the battery pulp when working ore as well as on tailings.

AT the annual meeting of the stockholders of the Lady Washington Mining Co., the following officers were elected: Monroe Thompson, pres.; R. N. Graves, vice pres.; and J. E. Jacobus, S. G. Whitney and W. B. English, directors. L. Oshorn was reelected secretary, and his financial statement showed a credit of about $6000.

An Individual Alarm Signal Apparatus.

Paul Seiler, the well known electrician of this city, has just patented through the MINING AND SCIENTIFIC PRESS Patent Agency a device which he calls an "individual alarm signal apparatus," the object of which is to obtain a special connection between two offices for telsgraphic, telephonic or other purposes. It is quite an ingenious invention and one which will be found very convenient, especially to agents at small stations. In railroad telegraphing, where it is often required to call the agent at night, the ordinary call from the instrument at the office would be annoying and would necessitate the operator being on the spot at all times, while at many isolated stations it is not necessary to call the operator except on special occasions. By the employment of this device the operator may live at any distance from the office, and when he is wanted at the instrument a special call will operate a signal or alarm conveniently located. The invention is also serviceable for calling policemen to their station, to light a lamp, to switch on an electric light or ring a bell for policemen to come to nearest police-box for orders, while in the telephone service it may be used to call up any desired station without alarming any other, and, as the operator in the central office is always on duty, a simple call from any of the other stations will attract the attention of the central office without giving a sound at any other station except the central. This is especially useful on telephone lines that connect towns where there are many stations on the same line.

The device consists in the employment of a polarized relay, the armature of which is adapted to stand in three different positions; a disk containing a number of pins, the movement of this disk being effected by clockwork and governed by a magnet; another magnet, the armature of which acts both as a pawl and short-circuiting device, and a third magnet with an armature; and a releasing device for automatic mechanism and the establishing of a contact to operate any alarm or signal which may be connected therewith. As it is highly important that signals or alarms should only be sent by the chief operator or train dispatcher to any of the offices, the apparatus is arranged so that it can only be operated from those stations having control of the battery and a suitable current-reversing switch.

Comstock Mine Products and Mill Returns.

On the 14th of March the Hale & Norcross mine passed into the hands of parties who, it was understood and believed, would inaugurate a series of reforms which would be for the benefit of the stockholders who had been so unconscionably fleeced by those previously in control.

Under the new management, and in pursuance with instructions received from the stockholders at the annual election, the reduction of the ore of the company was taken from the notorious Nevada mill and was continued at the Brunswick mill. This mill also has an "annex." The returns are now in, and we publish with this the details of the crushing of ore at the Brunswick mill under the management of the "reform" party:

HALE AND NORCROSS SILVER MINING COMPANY.

Date.	Tons Worked.	Average Value Car Samples.	Value as per Car Sample Assay.	Average Battery Assay.	Value as per Average Battery Assay.	Bullion to Company, with Silver at $1 29.29.	Discount and Charges on Bullion.	Net Returns to Company in Bankable Funds.	Per Cent of Battery Assay Saved.	Per Cent of Car Sample Assay Saved, Bullion.	Yield per Ton in Bullion.	Net Yield in Money.
BRUNSWICK MILL.												
March, 1892	400	$19 09	$36,271 00	$14 93	$ 5,996 00	$ 4,418 55	$1,073 93	$ 3,344 62	73 69	.....	$11 04	.....
April, 1892	1,900	22 58	42,902 00	15 64	29,716 00	20,802 11	4,941 09	15,861 02	70.00	57 35	10 95	$8 35
May, 1892	1,900	18 82	34,173 54	15 40	29,431 00	19,095 67	4,641 35	14,454 31	64 88	46 84	10 05	7 60
June, 1892	1,815			17 16	31,159 30	19,810 53	4,390 71	15,419 82	63 58	57.97	10 91	8 49
Totals	5,615		$113,346 54		$90,306 30	$59,708 31	$13,973 16	$45,735 15				
Averages—April, May and June	1620	$20 16		$16 09					66.13	54 05	$10 63	$8 14
OCCIDENTAL MILL.												
April, 1892	110			$15 24	$ 1,676 40	$ 1,417 18	$395 04	$1 022 14	84 5		$12 88	

By reference to this table it will be seen that during the months of April, May and June the Company milled 5615 1620-2000 tons of ore, valued at the mint at $113,346.54, which returned them in bankable funds $45,735.15, a difference of $67,611.39.

It is in place to investigate where this very large difference occurs. D. B. Lyman, Superintendent of the Consolidated California and Virginia, testified in the trial of Fox vs. Hale and Norcross Mining Company that there was a difference of 10 to 12 per cent between the car sample assays and the mill assays, and that the mill should always return not less than 65 per cent of the car sample assays.

John W. Mackay, in the same case, testified that the old contracts on the Comstock were to the effect that mills should purchase the ore by wagon assay at 65 per cent of that assay. He also testified that ore worth $14.00 per ton, car sample assay, at the Con. Virginia would pay all expenses and a small profit.

As these parties are mining men of long experience, their testimony can be safely taken as a basis for the analysis of the returns of the reform management of the Hale and Norcross.

Sixty-five per cent of $113,346.54 is $73,675.25. The company got in bullion $59,708.31, showing a loss of $13,966.94. Inasmuch as under the alleged customs of the Comstock country the mill got the tailings, this little plum went to the millmen. There is no profit to them to work the ore to a high per cent, for the less the company gets the more the mill gets. The custom claimed is simply a premium on dishonesty, and the result is seen in the fact that the millmen of Nevada are millionaires, while the shareholders in the mines that furnish the ore are paupers.

The account stands as follows: 5615-1620 tons of ore, assay value at mine, $20.16; value gross, $113,346.54; received for the same in bankable funds, $45,735.15; paid for milling 5615-1620 tons at $7, $39,310.67; net returns from $113,346.54 worth of ore delivered to the Brunswick mill, $6,424.48. This is 5.66 per cent of the value of the ore, or, in other words, ore which was worth $20.16 per ton at the mine, netted the company $1 14 per ton.

To recapitulate: Out of a ton of ore assaying at the mine $20.16, the mine gets $1.14 gold; the mill gets in gold coin, for crushing, $7, and the profits of the annex, which amount to bullion of the value of $2.48 per ton, or in all about $9 per ton in gold. With these figures before us, the question is easily answered whether the mines are run for the benefit of the stockholders or the mills. We have omitted in the above to call attention to the fact that during the month of April, when the Brunswick mill returned only 70 per cent of the battery assay, the Occidental mill returned 84 per cent. The figures in the table are all made up from the official records of the company.

When the Hale & Norcross mine passed to the bands of the present management, we are told that they were advised that responsible parties stood ready to reduce the ore of the company and would give them bonds to return them 70 per cent of the battery assay and charge them nothing for the milling. Under this arrangement, the new management would have received for the output of the months of April, May and June the sum of $63.214.10 in bullion, and allowing the same percentage for discount as by the table to make bankable funds, would net $48,403, against $6,424 48 received, or a loss of $41,978.52. Such management of trust properties as this should be promptly punished, and those directors who are responsible be compelled to pay the amount lost through their bad management. It is a source of congratulation to the stockholders that, as far as is publicly known, the mine is not entrusting any more ore to the thrifty millmen, and that movements are afoot to purchase a mill which should be put into different hands from those now employed.

The White Hills District.

In the White Hills, 50 miles north of Kingman, Arizona, some gold and silver mines have been discovered, which are turning out so well that they are attracting the attention of miners in California, Nevada, Colorado and New Mexico. Prospectors are numerous and bard at work. The camp is in Mohave county, in the Sacramento valley, about 50 miles from Hackberry, the most traveled route, however, being through Kingman. It was discovered by Judge Henry Schafer, who some nine years ago found some peculiarly rich float rock while making a trip from Eldorado canyon to Gold Basin. Ever since then he has searched occasionally for the ledge. He tells the story of how he got the original claims as follows:

"On one trip last May I had an Indian with me to pack water, and I induced him to show me where his father got the black oxide of iron which the tribe used as paint. The old man had a monopoly of this paint, keeping the locality a strict family secret and selling the stuff as required to members of his tribe. He made a good profit from his secret, as the black paint makes an attractive contrast with the red and yellow pigments which these Indians use on their bodies. He showed me this deposit, and it now forms the east end of the locations which I afterward made. It was from this incident that I named the locality Indian Secret Mining District. Although the ledges at this point are rich, they are not the source of the float rock, but I will locate it in time. The story told about the $200 being given to the Indian to guide me to this place is not correct, although, of course, he has been well rewarded. I had made a standing offer to all Indians of that amount for information regarding any rich mineral deposits, this sum of money, with them, being equivalent to a fortune. However, when I 'horned' some of this black oxide, I found traces of gold, and after making a cut and finding two ledges coming in at this point, of good width, I set to work to secure the ground as thoroughly as possible without giving the discovery any publicity."

Judge Schafer was in San Francisco this week, and has sold 13 of the claims to San Francisco and Stockton men for a price said to be $200,000. Six of the properties—the Horn Silver, Grand Army, Garfield, Treasure, Norma and Occident—are said to have about 1000 tons of ore in sight. Some 30 tons have been shipped and yielded from $250 to $500 per ton at the mill at Kingman. Water is very scarce at the camp and sells at $1.50 per barrel. As an inducement for some one to start a laundry there, E. W. Spears offers to furnish a lot and a tent and sell water at $1.25 per barrel. The miners will not be apt to wear boiled shirts in that camp for some time to come. Several hundred men are already on the ground and the usual saloons, houses, tents, gambling houses, etc., are to be found. Attempts are being made to find water by means of wells, and they will also bore for it. From all accounts, the ores of the camp appear to be exceptionally rich. There are no mines yet, and the deepest prospect shaft is only 30 feet, so the question of permanency is yet to be decided.

Coast Industrial Notes.

JACKSON DENNIS of Sutter Creek, Amador Co., is running pipe for water power for a new electric lighting plant on a small scale.

WORK is to be resumed on the new Bear valley dam at once. The dam was to be begun last season and built up a distance of 15 feet.

WORK has been commenced on the iron bridge across East street, near Howard, connecting the coal bunkers on Mission pier 2 with Rosenfeld's Sons' coalyard.

THE Southern Pacific has a special steamboat to travel up and down the Sacramento river gathering fruit for shipment East. The boat collects large quantities to be made up in carload lots.

THE big raft which was towed down from Noyo by the steamer Noyn consists of nearly 2,000 piles. It was 70 feet wide and nearly 1,000 feet in length. The raft was taken to Mission bay and broken up last week.

A LOT of machinery and supplies have been sent to the Bright Star mine, on Plute mountain, by Parke & Lacy of San Francisco and the St. Louis owners of the property, and it is stated that work will be resumed in the shaft just as soon as possible.

THE new steamer Peru, the largest merchant steamer yet built by the Union Iron Works of this city, is nearly ready for her first voyage to sea. She has been towed down to the Mail dock, where she has taken on coal. The first trip will be to China.

THE tug-boat Relief, which has been overhauled at the Union Iron Works, has been materially improved. In a trial trip over the bay course this week her engineer gave her a 13½ knot rate. She could give the big tug Fearless a good hard rub in a race.

THE Yellow Jacket, Crown Point and Belcher mines have shut down, throwing about 250 men out of employment. The reason given is that the stage of water in the Carson river is too low to operate the stamp mills. The Overman will be shut down from the same cause about August 1st.

PARTIES looking for a favorable location for a starch factory have found the conditions favorable at Petaluma, Sonoma county. It will afford a fair and assured market for large or small potatoes and give new impulse to that crop. The parties interested intend to have the manufactory in running order for the crop of this fall.

BY the frachise granted the Oakland Hawyard's and San Leandro electric road Monday night, the cars will leave Twelfth avenue, East Oakland, and reach Thirteenth street in Oakland proper by way of Twelfth, Sixteenth and Third avenues and Twelfth and Oak streets. The extension will not be completed until October 1st.

THE Fulton Iron Works are considering a proposition to to go to Oakland, a tract of land on the water-front having been offered them at what they consider favorable terms. The citizens are now considering a proposition to raise a bonus of $50,000, and, in the event of their success, the new plant of the Fulton will be built across the bay.

THE California olive oil growers in addition to making a display of their product at the World's Fair have decided to make an exhibition of pure California olive oils at the Manufacturers, Dealers and Consumers' Food Exposition at Madison Square Garden in New York in October next, and at the Italian-American Exposition now being held at Genoa, and which runs until January, 1893.

A WARRANT for $1,104,000 has been prepared at the Treasury Department in payment of the San Francisco public building site, and will be signed by Secretary Foster when he receives formal notification from the Attorney-General that the title is vested in the United States. The Government will spend a large amount on the building, much to the gratification of the mechanics of this city.

UNDER the new schedule recently adopted by the Cigar Makers' Union in settling the strike was one regarding "fancy-shaped" cigars. This was the only portion of the terms of agreement which was not satisfactory to the employers, and the latter asked that it be modified. The Cigar Makers Union has instructed its Executive Committee to make the necessary changes in the matter.

THE water from the Colorado river is flowing into Salton lake, Colorado desert, San Diego Co., but it has attained only a depth of 23 inches in the deepest part of the lake. For the past week the water has been at a stand, possibly lowered a little. The varying winds make it impossible to determine any fall. The salt works are in full operation, and there is good reason to believe there will be no suspension of work.

THE Central Pacific will pay its second semi-annual dividend of one per cent on August 1st. The dividend of two per cent per annum is payable twice a year, on February 1st and on August 1st. A short spur is being built from Bailey's, near Lower Soda Springs, east toward the lower McCloud river. About three miles of grading out of the intended twenty-eight are finished. The road will open up a timber country.

THE Oakland Consolidated Street Railway Co. and the Piedmont Cable Co. are having a lively time over a franchise to Piedmont, which has been applied for by the former corporation. At a meeting of the Supervisors, a long petition was presented from property owners asking that the franchise be granted. The Piedmont people have presented a petition signed by other property owners asking that the application be denied. The Supervisors now have the subject under consideration.

OAKLAND is having quite a boom in electric railroad matters. In addition to the franchise for an extension of the Haywards road into the city, the City Council on Monday night decided to recommend that the following ordinances pass to print: To J. L. Davie et al. for a franchise for an electric road along Harrison street to Fourteenth, to Franklin, to Twentieth, to Webster, to Broadway and to the city limits; to Wells Whitmore et al. for a franchise for an electric road along Harrison street to Fourteenth, to Webster, to Broadway and thence to the city limits; to George W. McNear a franchise for an electric road on Peralta street; to Theodore Meetz et al. the right to use electricity on his street-car line to Alameda; to the East Oakland Railway Company a franchise for an electric road over certain streets in East Oakland.

BEHREND JOOST says that in about two or three weeks the San Francisco Electric Railroad will be in operation from the corner of Guerrero and 18th streets along the latter street to the old Mountain House on the hillside below the Twin Peaks. The rails are laid, and seven tons of wire will be shortly put up. The two generators to distribute the electricity are up and working smoothly, and Mr. Joost declares that all the machinery is in first-class condition, and that the road will be running within the time predicted.

JUDGE J. S. STABLER, an expert in fruit matters, says that the growers, dryers and canners of fruit in this State this year will probably make more money than in any preceding one. Last year the crop here of all deciduous fruits was phenomenally large, which, however, had to contend with the largest crop, including apples, east of the Missouri river that had been harvested during the past ten years. This year California will produce fully as many peaches as last, nearly as many apricots and nectarines, and about half as many French prunes, while the pear crop promises to be even larger, and prices this year will rule nearly twice as high as last. Ever since the organization of the California Fruit Union, facilities for shipping and marketing green fruits have been improving; refrigerator cars have become eminently successful; new markets have been opened, and the auction plan for selling fruit immediately upon its arrival in Eastern cities has worked well. Fruit growers flatter themselves that they are insured two prosperous years, as a very poor prophet could foretell that the Columbian Exposition in 1893 will be the means of greatly enhancing the consumption in that line. It is noticeable that the leading canneries are receiving orders from the East and Europe well up to their packing capacity.

California State Mining Exposition.

The State Fair for 1892 will present a feature of unusual interest, which will attract the attention of not only the miners of California, but the general public as well. It is proposed to have an exhibition specially devoted to mining, where will be shown, on as realistic a scale as circumstances will permit, the various methods for handling and working gold-bearing quartz and gravel. California manufacturers of mining machinery, and all who are engaged in the mining industry, are solicited to cooperate and unite in making this, the first event of the kind ever attempted in the history of the State, a success. It is intended that this shall form the nucleus of the California Mining Exhibit in the approaching Columbian Exposition at Chicago, and therefore will be of double importance. Some of the principal objects displayed will be rock breakers and pulverizers, various mills for reduction of quartz, amalgamating and concentrating machinery, hoisting and pumping apparatus, electrical appliances as now employed in latest improved mine-working, hydraulic machinery for direct and transmitted application of power, a general exhibit of all kinds of mining tools and supplies, and all the recent inventions in the way of automatic and labor-saving devices, either by model or actual size. Besides which a number of unique and original ideas are contemplated, which if carried out will heighten the general interest.

The exhibition is under the auspices of the State Agricultural Society, but the immediate supervision and arrangement is under a special committee, of which Mr. George M. Mott of Sacramento is chairman, and Mr. W. G. Scott of 22 Montgomery St., San Francisco, is superintendent, from either of whom all particulars can be ascertained.

A special department, covering nearly 30,000 square feet, has been set apart for the exclusive use of this mining display. The State Fair dates are from September 5th to 17th inclusive. This portion of the annual event will prove most interesting and attractive, as the interest in mining is of no small magnitude, and many of our present population have but little idea of the vastness of this industry in our State. The idea of this exhibition is to bring this grand resource more generally to the attention of the public.

THE CAMINETTI BILL.—The hydraulic mining bill, which passed the House, has been considered by the Senate Committee on Mines and Mining. Senator Felton desired to offer one or two amendments, and the Senate Committee thought the measure of too much importance to be hastily considered during the closing days of the session, so that the prospects of passing it this session are gone. The matter will be deferred until Congress again convenes.

THE bodies of Breedlove and Fish, who were prospecting in Lower California, have been found. They had evidently perished from lack of water. Young Breedlove, who was with the party, has not yet been found, but a search is being made for him.

THE Executive Committee of the Southwest Miners' Association has decided to hold its annual meeting at El Paso on December 5th, 6th, 7th and 8th.

THE business portion of the mining town of Bodie, Mono county, was burned on Tuesday, but none of the mining works were injured.

NEARLY all the Cœur d'Alene mines are being worked again by nonunion men. The troops are being withdrawn.

THE annual meeting of the Risdon Iron Works of this city takes place on Monday next.

The National Mining Congress.

Resolutions Adopted at Helena, Montana.

Full reports are now at hand of the proceedings of the National Mining Congress at Helena. Delegates were present from seventeen States, and the main topic of discussion was the silver issue. The Congress was called to order by Governor Samuel T. Hauser, and, as chairman of the Executive Committee, he presented to the delegates Hon. Champion S. Chase, of Nebraska, who had been selected as temporary chairman. This gentleman, after a brief speech, introduced Governor Joseph K. Toole, who, in an address, welcomed the delegates on behalf of the people of the State of Montana. Hon. Francis G. Newlands of Nevada responded to Gov. Toole's address of welcome. The Committe on Permanent Organization recommended the selection of Frank G. Newlands of Nevada as permanent chairman of the Congress, and he was elected. The Vice-Presidents were as follows: Arizona—A. G. Hubbard, Phœnix. California—John Daggett, Black Bear. Colorado—M. H. Slater, Denver. Idaho—Hon. Leytton Price. Illinois—S. H. Bateman. Indiana—Frank Taylor, Indianapolis. Kansas—J. R. Mead. Michigan—H. H. Pingree, Detroit. Minnesota—Capt. Frank Barrett, St. Paul. Missouri—V. M. Hines, Houston. Montana—Geo. W. Irvin, II., Butte. Nebraska—Champion S. Chase, Omaha. Nevada—James R. Shaw, Dayton. Ohio—J. W. Watt, Boonville. Oregon—J. R. Romig, La Grande. Pennsylvania—R. J. Foster. Rhode Island—M. H Keefe. Utah—J. Q. Pachart. Washington—J. F. Walgemot. Wyoming—George C. Canis.

THE SILVER RESOLUTIONS.

The report of the committee on resolutions was as follows:

The National Mining Congress now in session at Helena, Montana, comprised of delegates from 19 States and 2 Territories, having in mind the interests of the cotton planters of the South, and the wheat grower of the West, of labor, of property in all its forms, as well as the interests of the miners of the mountain States and Territories, denounce the Act of 1873, by which silver was demonetized, as a great national calamity, and they hold it to be the imperative duty of the representatives of the people now in Congress assembled, to pass without delay the bill for the remonetization of silver that has already passed the Senate.

We also declare that the responsibility for the bullion in the silver dollars now coined being of less intrinsic value than the bullion of the gold dollars, rests solely with those who remonetized silver and forced the people to accept the laws of 1878 and 1890, by which free coinage for silver has been denied and the purchase of bullion by the Government in the lowest markets of the world substituted in its stead. And we further declare our unalterable conviction to be based upon sound economic principles and the actual experience of the world between 1850 and 1860, when the relative increase in the production of gold in the United States and the rest of the world far exceeded the relative increase of silver over gold during the last decade, that the remonetization of silver by the United States at the existiog ratio will speedily restore the intrinsic value of the silver dollar to that of the gold dollar.

While we demand that the intrinsic value of the gold and silver dollar shall be equal, we protest against the test of value as to silver being made while silver money is debased and the Government is engaged under existing laws in depressing the value of the bullion by purchasing it in the lowest markets; but we shall cheerfully welcome the test and accept any change that experience shall make necessary after the full use of silver has been restored for a reasonable time through the Act now before Congress, or any similar law.

We declare free bimetallic coinage for gold and silver at the existing ratio to be the most important public question now unsettled in the United States; that there is is a lack of sound metal money upon which to do the business of the country, and upon which to base a full and fair volume of Governmental paper money, and that there are powerful and preponderating influences in the two old parties seeking ultimately to bring this country to a single gold standard, in the meantime deceiving the people with declarations in party platforms about bimetalism which are deceptive and intended in no manner to bind Presidents elected upon them to approve a free coinage law.

We urge that in every section of the country, north as well as south, the true friends of free bimetallic coinage shall make the unquestioning friendship of every candidate for any office bearing any relation whatever to legislation upon that subject as one of the chief tests of worthiness to receive their suffrages. That it is only by clearly discerning the right and acting independently and unflinchingly to undo the great wrong of silver demonetization, that the conspiracy to force the United States to the single gold standard of money can be thwarted.

[E. V. Smalley, of Minnesota, stepped to the front of the rostrum, as soon as the applause had subsided following the reading of the majority resolutions, and presented a minority report as follows:

Resolved, That we believe that the prosperity and welfare of this country and of the entire business world require the full and free use of both gold and silver as metallic money and as the basis of paper currency. The enormous increase in the commercial transactions of the world during the past ten years has made it dangerous for any nation to restrict itself to the use of one of the precious metals as a measure of values and as a foundation for its paper circulating medium. We therefore demand of our Government such wise and prompt legislative and executive action as will lead to the restoration of silver to its old place in the circulating medium and secure and maintain a parity and intrinsic value for the gold and silver coinage of the country, so that the gold dollar and the silver dollar shall be accepted as of equal purchasing power by all the nations of the earth.

Then came a long and heated discussion over the minority report, but it was finally struck out.]

The other resolutions adopted were as follows:

WHEREAS, The theory of the Constitution is that electors for President shall be men of the highest dignity and integrity, fit to be entrusted with the gravest concerns of the nation, and that they shall, when elected, be free to cast their ballots for such persons for President as will best insure the safety, honor and prosperity of the country, and

Whereas, It has been the endeavor of the opponents of bimetallic coinage to secure the selection of candidates for the Presidency by the Republican and Democratic parties who, if elected, will oppose the will of the people by the executive veto whenever Congress shall express it in a free coinage bill, and

Whereas, To vote for electors pledged in advance to select either one or the other of them for President without conditions will be an indorsement in advance of the purpose to defeat the popular will, and

Whereas, In the silver States there is but one sentiment in all the three national parties in regard to the full remonetization of silver. Therefore be it

Resolved, That wisdom and patriotism both require that the people of the silver States and the State conventions of all parties therein shall so shape their action as to secure the balance of power, if that be possible, in the Electoral College, to the end that the electors elected by the people of such States may so act independently in the Electoral College as to defeat the election of any man as President who will not agree that the will of the people, as expressed in any future act of Congress in relation to silver, shall stand without executive interference or veto.

That in order to meet the contingency of a possible election of a President by the present House of Representatives, the constituents of the members of the present House be appealed to to demand of all members of the present House who are candidates for reelection the promise that they will support no man for President who will not permit the will of the people as expressed in the future act of Congress upon the silver question to stand without executive veto.

PAN-AMERICAN CONGRESS.

Resolved, That our commercial relations with South and Central America and Mexico should be cultivated and be made more intimate; that they are the natural markets for our surplus manufactures and farm products, and that it is of mutual interest and importance that the resolution passed by the pan-American Congress, in favor of an agreement between all American nations that a uniform silver coin be adopted which shall be legal tender for all commercial transactions between all the American Governments, should be carried into effect.

MINING LAWS.

This Congress declares that the present system of national, State and local laws governing the acquisition and ownership of mining claims of gold, silver and other precious metals is unsatisfactory and productive of litigation that renders title insecure and ownership largely profitless. Therefore, it calls upon Congress to provide for a commission composed of practical miners to be aided by such legal and scientific advice as may be necessary to prepare a code of laws that will be uniform in their operation, saving all existing rights intact, and simple and clear in their operation to the end that title may be readily and cheaply acquired, rights distinctly defined and the possibility of litigation, so disastrous to the industry, reduced to a minimum.

DEPARTMENTS OF MINING.

Resolved, That the industry of mining for gold, silver, copper, lead, coal, iron, stone and all other metals has assumed such magnitude and importance that it should be placed on a plane with that of agriculture, and we urge that Congress shall by law create a bureau of mines and mining, and that its head shall be made a member of the President's cabinet.

MINERAL LANDS IN RAILROAD GRANTS.

WHEREAS, Immense areas of the mineral lands of the West, in which thousands of discovered mining properties bearing the precious metals, are within the limits of the grants of the Pacific railroads; and

Whereas, These railroad companies claim, and there is great and immediate danger of the title being confirmed in these companies to all these mineral lands on the odd numbered sections, which were not known to be valuable mineral lands at the time of the grant, although they were reserved therefrom; and

Whereas, It seems that our only sure means of relief is in congressional action. Now, therefore be it

Resolved, That this mining congress call upon the representatives of the people in Congress assembled to promptly pass such an Act as will avert this threatened danger and save this vast heritage to the people, to whom it rightfully belongs.

FIRE DAMP EXPLOSIONS.

Resolved, That the national Congress be formally and urgently requested to enact a law and make a suitable appropriation to enable the President of the United States to appoint a commission consisting of a sufficient number of mining engineers, chemists and practical mine officials, whose duties shall be to make searching scientific inquiries into the causes that lead up to the disastrous explosions of gas, dust, explosives, etc., in the mines of America.

NATIONAL PARK.

WHEREAS, There is a bill segregating and throwing open to the public a portion of the Yellowstone National Park, in order to open a practicable route to an important mining district, which bill has been passed by the Senate of the United States and has been favorably reported to the House of Representatives by its committee;

Resolved, That we respectfully urge upon the House of Representatives that this measure be taken from the calendar and passed.

Resolved, That we object to the granting of exclusive rights of way to individuals or corporations over Indian, military or public reservations, and we favor general laws granting rights of way for irrigation canals, railways and routes of public travel and conveyance.

COLUMBIAN EXPOSITION.

WHEREAS, For the first time in the history of industrial expositions, a separate and distinct department has been created by the World's Columbian exposition and a great building constructed for the adequate exhibit of universal mining and metallurgy; and

Whereas, Reports so far made public indicate that the department of mines, mining and metallurgy will in every way reflect the extensive scope of mining operations, the genius engaged and the wealth employed therein in this and other countries; therefore be it

Resolved, That the National Mining Congress congratulates the World's Columbian Exposition upon its wisdom and progressiveness in establishing the department, and congratulates the mining world upon the grand opportunity afforded for giving mining the industrial rank to which it is entitled; and be it further

Resolved, That we pledge the department of mines, mining and metallurgy of the World's Columbian Exposition our united and individual cooperation.

Resolved, That it is the sense of this congress that the World's Fair should be open to the public on Sundays.

J. R. King of Montana offered the following supplemental resolution, which was carried:

Be it Resolved, That the Executive Committee of the Mining Congress take some action looking to the holding of a conference of all the gold and silver-producing States and nations of the world, to be held at the same time and place as the international monetary conference now called, to the end that they may be prepared to use all honorable means for the remonetization of silver.

A. J. Seligman presented a resolution (which was adopted) protesting against the passage of the bill removing the duty on lead. It was in the form of a memorial to the United States Senate.

To the President of the Senate of the United States and the Senators of the United States in Session Assembled: The Second National Mining Congress of the United States in session assembled at Helena, Montana, and representing 19 States and several Territories, hereby respectfully petition your honorable body to defeat the bill known as H. R. 561, now before your honorable body, being an amendment to paragraph 199, schedule C, of the Act of October 1, 1890, and entitled "An Act to reduce the revenue and equalize duties on imports and for other purposes," and denominated the "Free Lead Ore Bill." We urge upon your honorable body the necessity of the defeat of the measure, as we feel that the passage would inevitably result in the closing down of numbers of our silver mines of which lead is the principal part, and now being operated on a very narrow margin of profit, and the consequent throwing out of employment of thousands of hard-working miners whose very existence is dependent on the continuance of operations in these properties.

The Congress, on adjournment, decided to meet at Salt Lake City, Utah, Dec. 2, 1892.

The Revised Caminetti Bill.

The Amended Hydraulic Mining Measure.

The following is the full text of the mining bill which passed the House but has been temporarily halted in the Senate:

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That a commission is hereby created, to be known as the California Debris Commission, consisting of three members. The President of the United States shall, by and with the advice and consent of the Senate, appoint the commission from officers of the Corps of Engineers, United States Army. Vacancies occurring therein shall be filled in like manner. It shall have the authority, and exercise the powers hereinafter set forth, under the supervision of the Chief of Engineers and direction of the Secretary of War.

SEC. 2. That said commission shall organize within thirty days after its appointment by the selection of such officers as may be required in the performance of its duties, the same to be selected from the members thereof. The members of said commission shall receive no greater compensation than is now allowed by law to each, respectively, as an officer of said Corps of Engineers. It shall also adopt such rules and regulations, not inconsistent with law, to govern its deliberations and prescribe the method of procedure under the provisions of this act.

SEC. 3. That the jurisdiction of said commission, in so far as the same affects mining carried on by the hydraulic process, shall extend to all such mining in the territory drained by the Sacramento and San Joaquin river systems. Hydraulic mining, as defined in section eight hereof, directly or indirectly injuring the navigability of said river systems, carried on in said territory other than as permitted under the provisions of this act, is hereby prohibited and declared unlawful.

SEC. 4. That it shall be the duty of said commission to mature and adopt such plan or plans, from examination and surveys already made, and from such additional examinations and surveys as it may deem necessary, as will improve the navigability of all the rivers comprising said systems, deepen their channels, and protect their banks. Such plan or plans shall be matured with a view of making the same effective as against the encroachment of and damage from debris resulting from mining operations, natural erosion or other causes, with a view of restoring, as near as practicable and the necessities of commerce and navigation demand, the navigability of said rivers to the condition existing in eighteen hundred and sixty, and permitting mining by the hydraulic process, as the term is understood in said State, to be carried on without injury to the navigability of said rivers or the lands adjacent thereto.

SEC. 5. That it shall further examine, survey and determine the utility and practicability, for the purposes hereinafter indicated, of storage cites in the canyons and tributaries of said rivers and in the respective branches of said tributaries, or in the plains, basins, sloughs and tule and swamp lands adjacent to or along the course of said rivers, for the storage of debris or water or as settling reservoirs, with the object of using the same by either or all of these methods in aid of the improvement and protection of said navigable rivers by preventing deposits therein of debris resulting from mining operations, natural erosion, or other causes, or for affording relief thereto in flood time and providing sufficient water to maintain scouring force therein in the summer season; and in connection therewith to investigate such hydraulic and other mines as are now or may have been worked by methods intended to restrain the debris and material moved in operating such mines by impounding dams, settling reservoirs, or otherwise, and in general to make such study of and researches in the hydraulic mining industry as science, experience and engineering skill may suggest as practical and useful in devising a method or methods whereby such mining may be carried on as aforesaid.

SEC. 6. That the said commission shall from time to time note the conditions of the navigable channels of said river systems, by cross-section surveys or otherwise, and observe the effect thereon of such hydraulic mining operations as may be permitted by its orders.

SEC. 7. That said commission shall submit to the Chief of engineers, for the information of the Secretary of War, on or before the 15th day of November of each year, a report of its labors and transactions, with plans for the construction, completion and preservation of the public works outlined in this act, together with estimates of the cost thereof, stating what amounts can be profitably expended thereon each year. The Secretary of War shall thereupon submit same to Congress on or before the meeting thereof.

SEC. 8. That for the purposes of this act "hydraulic mining" and "mining by the hydraulic process" are hereby declared to have the meaning and application given to said terms in said State.

SEC. 9. That the owner or owners, or in the case of a corporation its manager or agent appointed for that purpose, owning mining ground in the territory in the State of California mentioned in section three hereof, which it is desired to work by the hydraulic process, may file with said commission a verified petition, setting forth such facts as will comply with the rules prescribed by said commission.

SEC. 10. That said petition shall be accompanied by an instrument duly executed and acknowledged, as required by the law of the said State, whereby the owner or owners of such mine or mines surrenders to the United States the right and privilege to regulate by law, as provided in this act, or any law that may hereafter be enacted, or by such rules and regulations as may be prescribed by virtue thereof, the manner and method in which the debris resulting from the workings of said mine or mines shall be restrained, and what amount shall be produced therefrom, it being understood that the surrender aforesaid shall not be construed as in any way affecting the right of such owner or owners to operate said mine or mines by any other process or method now in use in said State.

SEC. 11. That the owners of several mining claims situated so as to require a common dumping ground or dam or other restraining works for the debris issuing therefrom in one or more sites may file a joint petition setting forth such facts in addition to the requirements of section nine; and where the owner of a hydraulic mine or owners of several such mines have and use common dumping sites for impounding debris or as settling reservoirs, which sites are located below the mine of an applicant not entitled to use same, such fact shall also be stated in his petition. Thereupon the same proceedings shall be had as provided for herein.

SEC. 12. A notice specifying briefly the contents of said petition and fixing a time previous to which all proofs are to be submitted shall be published by said commission in some newspaper or newspapers of general circulation in the communities interested in the matter set forth therein. If published in a daily paper, such publication shall continue for at least five days; if in a weekly paper, in at least two issues of the same. Pending publication thereof said commission, or a committee thereof, shall examine the mine and premises described in such petition. On or before the time so fixed all parties interested, either as petitioners or contestants, may file affidavits, plans and maps in support of their respective claims. Further hearings, upon notice to all parties of record, may be granted by the commission when necessary.

SEC. 13. That in case a majority of the members of said commission, within thirty days after the time so fixed, concur in a decision in favor of the petitioner, the said commission shall thereupon make an order directing the methods and specifying in detail the manner in which operations shall proceed in such mine or mines; what restraining or impounding works, if facilities therefor can be found, shall be built and maintained; how and of what material; where to be located; and in general set forth such further requirements and safeguards as will protect the public interest and prevent injury to the said navigable rivers, with such further conditions and limitations as will observe all the provisions of this act in relation to the working thereof and the payment of taxes on the gross proceeds of the same: *Provided*, That all expense incurred in complying with said order shall be borne by the owner or owners of such mine or mines.

SEC. 14. That such petitioner or petitioners must within a reasonable time present plans and specifications of all works required to be built in pursuance of said order for examination, correction and approval by said commission; and thereupon work may immediately commence thereon under the supervision of said commission or representative thereof attached thereto from said Corps of Engineers, who shall inspect same from time to time. Upon completion thereof, if found in every respect to meet the requirements of the said order and said approved plans and specifications, permission shall thereupon be granted to the owner of such mine or mines to commence mining operations, subject to the conditions of said order and the provisions of this act.

SEC. 15. That no permission granted to a mine owner or owners under this act shall take effect, so far as regards the working of a mine, until all impounding dams or other restraining works, if any are prescribed by the order granting such permission, have been completed and until the impounding dams or other restraining works or settling reservoirs provided by said commission have reached such a stage as, in the opinion of said commission, it is safe to use the same: *Provided, however*, That if said commission shall be of the opinion that the restraining and other works constructed at the mine or mines shall be sufficient to protect the navigable rivers of said system and the work of said commission, then such mine or mines may be permitted to commence operations.

SEC. 16. That in case the joint petition referred to in section eleven hereof is favorably acted upon, the commission shall fix the respective amounts to be paid by each owner of such mines toward providing and building necessary impounding dams or other restraining works. In the event of a petition being filed after the entry of such order, or in case the impounding dam or dams or other restraining works have already been constructed and favorably considered, the commission shall fix such amount as may be reasonable for the privilege of dumping therein, which amount shall be divided between the original owners of such impounding dams or other restraining works in proportion to the amount respectively paid by each party owning same. The expense of maintaining and protecting such joint dam or works shall be divided among mine owners using same in such proportion as the commission shall determine. In cases where it is practicable, restraining and impounding works are to be provided, constructed and maintained by mine owners near or below the mine or mines before reaching the main tributaries of said navigable waters.

SEC. 17. That at no time shall any more debris be permitted to be washed away from any hydraulic mine or mines situated on the tributaries of said rivers and the respective branches of each, worked under the provisions of this act, than can be properly cared for at or below said mine or mines, as per order of said commission, or by the restraining works erected in accordance with the directions of this act by said commission.

SEC. 18. That the said commission may at any time, when the condition of the navigable rivers or when the capacities of all impounding and settling facilities erected by mine owners or such as may be provided by Government authority require same, modify the order granting the privilege to mine by the hydraulic mining process so as to reduce amount thereof to meet the capacities of the facilities then in use, or if actually required in order to protect the navigable rivers from damage, may revoke same until the further notice of the commission.

SEC. 19. That an intentional violation on the part of a mine owner or owners, company or corporation, or the agents or employes of either, of the conditions of the order granted pursuant to section thirteen, or such modifications thereof as may have been made by said commission, shall work a forfeiture of the privileges thereby conferred, and upon notice being served by the order of said commission upon such owner or owners, company or corporation, or agent in charge, work shall immediately cease. Said commission shall take necessary steps to enforce its orders in case of the failure, neglect or refusal of such owner or owners, company or corporation, or agents thereof, to comply therewith, or in the event of any person or persons, company or corporation working by said process in said territory contrary to law.

SEC. 20. That said commission, or a committee therefrom, or officer of said corps assigned to duty under its orders, shall, whenever deemed necessary, visit said territory and all mines operating under the provisions of this act. A report of such examination shall be placed on file.

SEC. 23. That the said commission is hereby granted the right to use any of the public lands of the United States, or any rock, stone, timber, trees, brush or material thereon or therein, for any of the purposes of this act; and the Secretary of the Interior is hereby authorized and requested, after notice has been filed with the Commissioner of the General Land Office by said commission, setting forth what public lands are required by it under the authority of this section, that such land or lands shall be withdrawn from sale and entry under the laws of the United States.

SEC. 24. That any person or persons who willfully or maliciously injure, damage or destroy, or attempt to injure, damage or destroy, any dam or other work erected under the provisions of this act for restraining, impounding or settling purposes, or for use in connection therewith, shall be guilty of a misdemeanor, and upon conviction thereof shall be fined not to exceed the sum of five thousand dollars or be imprisoned not to exceed five years, or by both such fine and imprisonment, in the discretion of the court.

SEC. 25. That upon the construction by the said commission of dams or other works for the detention of debris from hydraulic mines and the issuing of the order provided for by this act to any individual, company or corporation to work any mine or mines by hydraulic process, the individual, company or corporation operating thereunder working any mine or mines by hydraulic process, the debris from which flows into or is in whole or in part restrained by such dams or other works erected by said commission, shall pay a tax of three per centum on the gross proceeds of his, their or its mine so worked, which tax of three per centum shall be ascertained and paid in accordance with regulations to be adopted by the Secretary of the Treasury. All sums of money paid into the Treasury under this section shall be set apart and credited to a fund to be known as the debris fund, and shall be expended by said commission under the supervision of the Chief of Engineers and direction of the Secretary of War, in addition to the appropriations made by law in the construction and maintaining of such restraining works and settling reservoirs as may be proper or necessary: *Provided*, That said commission is hereby authorized to receive and pay into the Treasury from the owner or owners of mines worked by the hydraulic process, to whom permission may have been granted so as to work under the provisions hereof, such money advances as may be offered to aid in the construction of such impounding dams or other restraining works, or

settling reservoirs, or sites therefor, as may be deemed necessary by said commission to protect the navigable channels of said river systems, on condition that all moneys so advanced shall be refunded as the said tax is paid into the said debris fund: *And provided further*, That in no event shall the Government of the United States be held liable to refund same except as directed by this section.

SEC. 26. That the said commission, in order to secure harmony in work to be constructed for reclamation and drainage purposes on said river systems, with present plans of river conservation, or with such plans as may hereafter be adopted as provided by this act, having in view their protection from the encroachment of mining debris or other material, and to promote efficiency and economy, is empowered to consult thereon from time to time with a commission of engineers authorized to join such conference by the laws of the State of California. The result of such conferences shall be reported to the Chief of Engineers for transmission to Congress. The consent of the United States, in so far as it is necessary to confer same on account of its reserved control over said navigable rivers, is hereby granted to the State of California, or any municipal or local organization authorized by the laws of said State, to construct such works at its expense: *Provided*, That whenever the navigable waters of said systems are, or may be, affected thereby, the plans therefor shall be recommended by the commission created by this act and approved by the Chief of Engineers, United States Army.

SEC. 27. That said commission, in order that such material as is now, or may hereafter be, lodged in the tributaries of the Sacramento and San Joaquin river systems resulting from mining operations, natural erosion or other causes, may be prevented from injuring the said navigable rivers or such of the tributaries of either as may be navigable, is hereby directed and empowered, when appropriations are made therefor by law, or sufficient money is deposited for that purpose in said debris fund, to build at such points above the head of navigation in said rivers and on the main tributaries thereof, or branches of such tributaries, or at any place adjacent to the same, or at any point calculated, in the judgment of said commission, to effect said object (the same to be of such material as will insure safety and permanency), such restraining or impounding dams and settling reservoirs, with such canals, locks or other works adapted and required to complete same. The recommendations contained in Executive Document Numbered Two Hundred and Sixty-seven, Fifty-first Congress, second session, and Executive Document Numbered Ninety-eight, Forty-seventh Congress, first session, as far as they refer to impounding dams, or other restraining works, are hereby adopted, and the same are directed to be made the basis of operations. The sum of dollars is hereby appropriated, from moneys in the Treasury not otherwise appropriated, to be immediately available, to aid in maturing plans and in the building and construction of such works and the acquirement of sites therefor where necessary so to do: *Provided*, That not more than 15,000 dollars be expended to defray the expenses of said commission.

The Mines of Butte County.

The Bangor Blue Lead.—Gravel and Quartz Claims.

FORBESTOWN, July 23, 1892.

TO THE EDITOR:—A few weeks ago a prominent mining man remarked to the writer: "Six months since I knew of at least 25 mills in Butte county and the immediate mining vicinity which their owners were but too anxious to dispose of at any price. To-day I know of scarcely one for sale. Some have changed hands, but in most cases those who have mills, or mining properties in general, have decided to hold on to them." And this disposition to renewed interest in mining is generally observable throughout the county.

A month ago, when I visited this part of the State, several projects which were being talked of, or newly starting, have now assumed practical shape. It seems as if the capital which had lain idle awaiting the resumption of hydraulicking had become discouraged or disgusted, as far as Butte county is concerned, and sought a new investment. This has led to the erection of mills, the development of many old abandoned or half-worked claims, or of entirely new ones, and encouraged to further activity those mines already working. A desire to see legitimate mining once more succeed is generally prevalent, and those who are now investing seem to be doing so with that aim in view.

The "Bangor Blue Lead" is the district attracting by far the greatest attention at present. Three mines are in operation, or will very shortly be, and two others will soon be opened. The town has assumed an appearance of activity that it has not known in years.

The "lead" has been worked in a more or less desultory manner for the past 25 years, though it was known to be a profitable field. The character of the gold-bearing material is, as the name implies, a cement gravel, belonging to an ancient river channel. This channel is plainly traceable a distance of six miles or more westward from Bangor to the old mining camp of Kentucky Ranch.

The first claim to be opened and get in operation was the Catskill, owned by 11 Marysville capitalists and farmers. They have tapped the channel on the south rim with a 140-foot shaft. From this they have run a main gangway in about 175 feet, and two side drifts of 50 feet each. At present the company claims to be in a very rich streak, with prospects bettering steadily. They have run in this pay dirt 90 feet across the channel without reaching the other side. The last cleanup amounted to $1500 for a 10-days' run which, under the present unsatisfactory plant, is a remarkable showing.

One arrastre and a threshing engine are doing the work, but it is the intention shortly to erect hoisting works, put in stationary engines, four arrastres and sink another shaft about 100 feet west of the present building. Twenty-six men are regularly employed.

Mr. Campbell, an experienced mining man, is superintendent, and the success of the mine is largely due to his efforts.

W. W. Will of Oroville has the property known as the old Bishop mine. For a year or so he has been prospecting, and, evidently satisfied with that, has put up hoisting works, an 11-foot arrastre, engines, steam pump, etc.

THE BLUE AND GOLD.

The Blue and Gold mine of Hay & Clark is, however, the one on which attention is particularly centered, and of which great things are expected. Though young men, they have gone to work in a business-like manner. They purchased, some two months ago, the complete plant of the old Golden Eagle Mining Company of Mineral Slide. This has all been removed to Bangor, and they are now busily at work putting the 20 stamps in position, and, in another month, expect to be running a hundred tons a day through their mill. Their experiment will be watched with keen interest, for it is to settle the question of superiority of stamps over arrastres on the blue gravel of Bangor. The other claims are firm in their faith in the sole adaptability of the arrastre and in the inevitable failure of the stamps. Messrs. Hay & Clark studied the situation thoroughly before their final decision, and investigated carefully all the methods in use.

The mine is known as the Potter claim and lies east of and adjoining the Bishop mine. There are two shafts, one 78 feet, the other 130 feet, and connected by a tunnel, which gives splendid ventilation. From the western and deeper shaft runs a shaft 200 feet farther into the hill. The prospect bids very fair. These gentlemen have also a claim on the Kentucky ranch end of the lead, in conjunction with Capt. Smith of Oakland. Here they have run a cut 120 feet, and a tunnel 70 feet across the channel. If this property gives promise, they will put a mill up to be run by water power.

Two Marysville companies have been formed to work other mines on the lead. One has begun cleaning out the shaft on the Turner claim east of the Blue and Gold mine. The other has what is known as the Johnson property, lying between the Catskill and Bishop mines. They have but recently formed, and have not given their plans to the public.

On the road from Bangor to Forbestown, one passes two Yuba county mines worthy of mention. The five-stamp mill of R. M. Johnson is three miles beyond Hansonville. This is at a small mine, with a 75-foot shaft, on a fair-paying ledge of quartz. It has been running steadily all spring. Alvinza Hayward is said to be negotiating for a bond of this property.

At Brownsville the only claim in operation is the Clark mine, J. C. Campbell superintendent. A ten-stamp mill was erected last fall, and has run steadily all this season. Power is generated by a 44-inch Pelton wheel under a 60-foot head, and is transmitted by a wire cable, 200 yards to the mill, giving complete satisfaction. The ore is taken from a ledge varying from two to eight feet in width, with general direction north and south, and dipping to the east. The tunnel is in 900 feet. It is intended to sink a lower shaft to the 280 foot level and tap the ledge at that depth. The ore runs heavily in sulphurets averaging $260 to the ton, with only about 30 per cent of the gold as free. This, consequently, necessitates treatment of the sulphurets, and it is intended shortly to build reduction works in connection with the mill. Mr. Campbell is making a number of interesting experiments with the cyanide process.

At Forbestown, besides a number of small claims, two large mines are in operation, giving employment to about 70 men. The Shakespeare mine was taken charge of by Alvinza Hayward about a year ago under bond from Messrs. C. F. Belding, Chas. Nickerson and H. E. Vail. Mr. Geo. Price, a young man and an experienced miner, is superintendent. Under Mr. Price, an incline has been sunk down the ledge to a depth of 260 feet, with a level at 240 feet, from which run north and south drifts. The north drift strikes the pay chute, and it is intended to extend the south one to form an adit and give a drainage. Last fall a ten-stamp mill was erected about 150 yards below the hoisting works. It has not been in operation, however, except for a prospect run of 500 tons of ore from the 240-foot level. The mill is run by a Knight wheel, and as soon as new hoisting works are built, it will be started up. The ore will be conveyed from the mine to the mill by a wire ropeway. It was the first intention to run down 1000 feet before beginning crushing, but work will probably be commenced before then.

A brick kiln is being built, preparatory to the erection of chlorination works.

The Gold Bank mine, the property of W. W. Stow, of San Francisco, has been running 20 stamps steadily for the past five years. During that time the vein has been developed by an incline which has reached a depth of 365 feet, and by three levels. At 65 feet a drift extends west 800 feet and east 300 feet, the general direction of the ledge being northeast and southwest. Level No. 2 at 100 feet has an east drift in 150 feet, in which they are now working. The west drift extends 300 feet. Level No. 3 is at 365 feet, the present bottom of the incline. Drifts have been run here east and west, 70 and 150 feet respectively.

Mr. H. P. Stow, the superintendent, is reserved in his statements regarding the paying qualities of the mine. I understand that an especially rich strike has been made in the past few days. That the mine is doing well may be judged from the fact that the mill is being enlarged to receive 20 more stamps. Mr. Stow said there was enough ore in sight to keep the 40 stamps going for another five years. New hoisting works are also in course of erection. An extensive chlorination plant is run in conjunction with the mill.

The 10-stamp mill of Mr. Chas. Nickerson on the Golden Queen mine has been shut down for several months, but for what reason has not been made public.

It was not until recently that attention was turned to quartz mining in this section, though many ledges were known to exist that carried more or less gold. The closing down, however, of hydraulicking forced attention toward this branch of mining; but milling has proven too expensive a process to most of those who have quartz locations, though they were previously hydraulicking to some advantage. This is one section where the enforced idleness of monitors has worked not only serious injury to their owners, but decided injustice. There were no large destructive claims and many small, profitable ones, while the character of the tailings and the nature of the country were such that little sediment reached the rivers, or was ever carried into the valley. The farther one goes into the mountains the more serious appears the effect of the prevention of hydraulicking. The justice, to a certain extent, of the farmers' demands is recognized by the miners, and hopes of an amicable settlement are still entertained, though they are admittedly growing fainter.

RIVER MINING.

At Colonel McLaughlin's Golden Feather mine, the whole of the Feather river has been turned into the canal. The foot dam will be put in immediately, and as soon as that is completed the river channel will be pumped out and the actual work of mining the gravel in its bed begun. The final success of this scheme will be watched with considerable interest, as immense sums of money have been expended in building the dams and the great canal or flume which drains the river for over a mile.

In Morris ravine, three miles above Oroville, a number of small claims are being worked to good profit. J. C. Potter, Joe Henley and John Wagner have gravel mines of considerable promise. In washing the tailings lately, Mr. Wagner cleaned up six ounces of coarse gold, including two nuggets of two ounces each, in a single afternoon.

ON JORDAN HILL,

Near Deadwood, 25 miles above Oroville, are two promising mines. The Rainbow mine is the property of Capt. Griffiths of San Francisco and is under the superintendence of I. J. Houghton, lately connected with the Brown Bear mine. A five-stamp mill is about completed and a good body of quartz has been exposed. During the past few months, besides putting in the mill, Mr. Houghton has been busily engaged digging a ditch, three miles in length, and in straightening and timbering the shaft, which is down about 100 feet.

Adjoining the Rainbow is the Paxton mine. Mr. Paxton is at present clearing out an old tunnel, which taps the ledge 640 feet in and runs along the vein 300 feet. Owing to poor ventilation, he has found it necessary to sink a shaft down on the ledge and connect with the tunnel. Machinery for a ten-stamp mill is now on the spot and will shortly be put in position. The ledge is generally traceable and where it has been developed shows a prospect of from $5 to $10 per ton. The same ditch that runs to the Rainbow mine will furnish water to develop the power for Mr. Paxton's Pelton wheel.

MAGALIA RIDGE.

One passes beyond the Jordan to Paradise, which, in Butte county, is on Poverty ridge, over against Dogtown and in the Helltown mining district. Here, on what is generally known as the Magalia ridge, are several mines in operation, the principal among which is the Mineral Slide Consolidated. This is owned by Col. McLaughlin and Mr. Nickerson of Oroville and S. V. Moody, the latter also being superintendent, and under whom the mine has made its richest developments. The gravel in places has run very high.

During the heavy rains of this spring, work was greatly impeded by the continual slides and caves and the settling of the mountain. Within the past month, though, about 50 men have been put at work and five tunnels are now opened. The longest, at the south end, is in 1200 feet and drains the entire ridge. In order to obviate the danger of caves, which hitherto have been a source of great hindrance as well as a menace to the lives of the miners, a bedrock tunnel is being driven, from which the mine in future will be worked by upraise. This is now in over 200 feet.

Across Little Butte creek from this mine is the Eureka, which has been a very rich paying mine, but at present is in the hands of lien holders who are doing the work in a desultory manner. A settlement is likely, however, soon to take place by which the mine will again be put in proper shape.

South of the Eureka is the claim of the Wylie Bros. For three years they have been driving a tunnel under the lava capping, hoping to tap the great "Mammoth channel," which, by arguments unique and highly plausible, they claim must lie somewhere along the ridge into which they are working. They are now in 1400 feet, and are pushing farther ahead confidently, despite the numerous incredulous shakes of the head of many who look upon them as foolhardy visionaries.

Bader Bros. have leased their claim below Magalia, or Dogtown as it is more generally known, to a Chico gentleman, who is preparing to clean out the old tunnel and begin sluicing.

East of Paradise about four miles, and in the same district as the foregoing mines, is the Lewis or Durgin mine. A tunnel has been driven, and splendid prospects are known to have been found. Mr. Lewis expressed himself as perfectly satisfied with what he has. Above this is the Mossback mine of Messrs. Knox, Lowe, Pierson & Banning, who have run two tunnels into the ridge, hoping to strike the pay channel. At present they are running through a hard quartzite formation, but, judging by the showing of adjacent mines, they hope soon to strike pay gravel.

The famous Perschbacker mine above Magalia is still idle. This has proven fabulously rich as far as it has been possible to work it, but no means have yet been found to cope satisfactorily with the vast quantities of water that pour into the mine continually. Various schemes are talked of, such as running a tunnel from Big Butte creek, a distance of five miles, to drain the whole ridge. The impracticability of this scheme is patent on the face. Another is to sink a shaft at the lower end of the claim and through the lava capping, and thus offer an opening to the channel. But this, while it seems the only way, is scarcely practicable, owing to the uncertainty of the course of the channel, which is very narrow and tortuous where it has been developed; and the sinking of a shaft would be but guesswork. Such guessing is highly expensive, too.

I am told there are many mines working above Dogtown and about Minshew, Lovelock and Powelton. Prospectors are out in every direction, and every miner one meets has a claim he is working or waiting to find means to develop.

The one drawback to the hopefulness of the miner of today seems to be the low rate of wages prevailing. Three dollars a day is considered good pay, and two and a half is the general average, while in places wages are as low as two dollars a day. An improvement is hoped for as the mines are further developed and show results which would warrant an advance.

TOWNSEND.

MECHANICAL PROGRESS.

Nicks in Metal.

The statement is sometimes made that, owing to the homogeneity of steel, a bar of this metal with a surface crack or nick in one of its edges is liable to fail hy the gradual spreading of the nick, and thus break under a very much smaller load than a sound har. With iron, it is contended this does not occur, as this metal has a fibrous structure. Even the late Sir William Siemens supported this theory, and likened a har of steel to one of indiarubher, which, as everyone knows, is greatly weakened hy a nick in one of its edges. Sir Benjamin Baker has, however, shown that this theory, at least so far as statical stress is concerned, is opposed to the facts, as he purposely made nicks in specimens of the mild steel used at the Forth hridge, hut found that the tensile strength of the whole was thus reduced by only about one ton per square inch of section. This settled the matter so far as statical stresses are concerned, and we now find in a recent numher of *Engineering News* an account of an experiment carried out hy the Union Bridge Company, in which a full-sized steel counter har, with a screw-turned huckle connection, was tested under a heavy statical stress, and at the same time a weight weighing 1040 pounds was allowed to drop on it from various heights. The har was first hroken by ordinary statical strain, and showed an ultimate breaking stress of 66,800 pounds per square inch, with an elongation of 29.17 per cent on 12 inches. The reduction of area at fracture was 52.4 per cent. The longer of the hroken parts was then placed in the machine and put under the following loads, while a weight, as already mentioned, was dropped on it from various heights at a distance of five feet from the sleeve nut of the turn buckle as shown below: .

Stress in lbs. ₱ sq. in.	50,000	55,000	60,000	63,000	65,000
	ft. in.	ft. in.	ft. in.	ft. in.	ft. in.
Height of fall	2 1	2 6	3 0	4 0	5 0

The weight was then shifted so as to fall directly on the sleeve nut, and the test proceeded as follows:

Stress on specimen in lbs. ₱ sq. in.	65,350	65,350	63,800
	ft.	ft.	ft.
Height of fall	3	6	6

It will be seen that under this severe trial the har actually carried more than when originally tested statically, showing that the nicking of the bar hy screwing had not appreciahly weakened its power of resisting shocks.

Orderly Shops and Good Tools.

There are few mechanics who realize the importance of keeping their tools in perfect order, says an exchange. Nevertheless, the experience of every one having to work with a set of tools ought to prove that he should love his tools and regard them with pride. We scarcely recollect a single instance of a really good workman who did not possess this affection for, and pride in, the implements which enahled him to turn out his work well.

If hammers are rusty and with faces covered with careless nicks, and fitted with ill-shaped and broken handles; if sharp-edged tools are badly ground and covered with rust; if cold chisels are made very much like old shanks taken at random from the scrap pile, and litter, dirt, tools and fragments are clustered together in a close conglomeration, it will convey about the same idea to the ohserver that a heggar in tattered habilments would in the parlor of a prince. Every one would feel a great desire to either eject the intruder from the apartment or at once leave the place himself. There are instances where this affection for, and pride in implements have gone extremely far and become almost a monomania—so much so that the journeyman could scarcely bear to see you examining his chisels, files, etc., and seemed to have a fear, while you were looking at them, of some outward effect like that which the Indians attrihute to an evil eye, hut which merely arose from a species of selfish affection for these children of his handicraft.

Every tool should have a place and he kept there when not in use. The amount of time saved in a year hy having everything in order is astonishing. It often happens that when a joh is to he done in a hurry, there is more time wasted looking for tools than would he required to do the joh. This does not pay, and, hesides, the customer goes away in an unpleasant condition of mind, and will not be apt to take another joh to that shop if he can help it; hut he will be almost glad of the opportunity of visiting the shop where work is done promptly and pleasantly. The people soon find out the best shop to deal at, and the best shop gets the cream of the trade, while the old fogies growl and grumble while the dust is settling on them, which they are too lazy to shake off.

I have known men starting in business in towns where there did not seem a ghost of a chance for them to succeed, yet in a short time they were doing a prosperous husiness. They would never have done so if they had not done their work well and paid proper attention to their husiness; or, in other words, they did everything in an orderly manner.

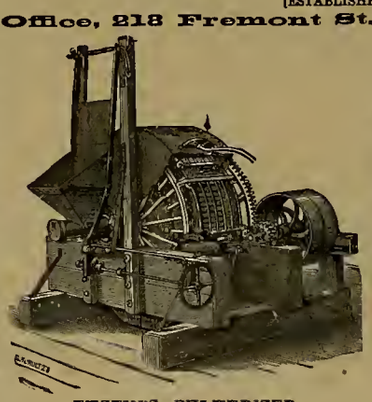
In some shops, cuttings of lumber are all mixed together in one pile, and much time is lost in looking for pieces of certain size. The result is that a whole hoard or piece is cut into, just because they did not have time to look up pieces, when if the pieces had heen handy they could have been used. In these days, when competition is sharp, it is very important to consider these things. There are many shops in this country that do not pay just because everything is done in such a disorderly manner.

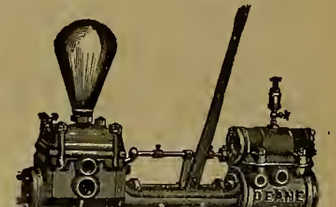
CHROME STEEL TURRETS.—The chrome steel turret invented a short time ago hy a French navy officer is said to he a great improvement over previous conning towers. In its design, the inventor has endeavored to avoid the weak spots that render others of a similar character practically worthless. Instead of merely revolving or disappearing by the aid of machinery, an operation which exposes the apertures to the enemy's fire, the new cupola swings, pendulum fashion, upon a horizontal axis for ten degrees. This is accomplished by means of a counterpoise, weighing 24 tons, which is easily kept under the control of one man. Friction is reduced hy a rolling motion. A cylinder under the revolving part fits into another cylinder, of which the surface is partly concave. When it is required to fire the guns, the cupola is brought round to the desired point, and after the discharge it swings hack by itself, thus putting the apertures out of sight of the enemy. The whole operation of swinging only occupies five seconds, and during two seconds only are the apertures exposed to fire. The mechanism of the cupola is said to be very ingenious, hut the details are, of course, kept a close secret. The French firm manufacturing this turret first supplied a number to the Belgian Government, which has used them in the fortification of the Meuse. It is now executing an order for 29 on account of the Roumanian Government, for the defense of Bucharest, and it is stated that the French Government contemplates ordering 30.—Manufacturers' Gazette.

OLD RAILROAD IRON FOR BRIDGES. Something of a new departure in the utilization of old railroad iron is noted in the construction of a highway bridge across the Pequabuck river at Terryville, Ct. It is a truss bridge, having a span of 19 feet and a width of 38 feet, and rests upon stone abutments, on each of which an iron rail rests and forms the sills, upon which the "strings," which are also old iron rails, are laid, there being of these 15 in this bridge, placed at equal distances. Another rod or spindle across the center, under and at right angles with the stringers, is supported by iron rods depending from the trusses, which also support the bridge. Each of the trusses is formed by two rails, the ends of which are fitted into solid iron castings made of especial shape to receive them, and meeting at the center of the bridge are also held together hy similar castings, through which the iron rod extends, and hraces extending on either side to the end of the spindle give strength as well as rigidity to the structure, comparing favorahly as to these qualities with hridges of considerably greater cost. Heavy planks covered with a concrete pavement form the floor.

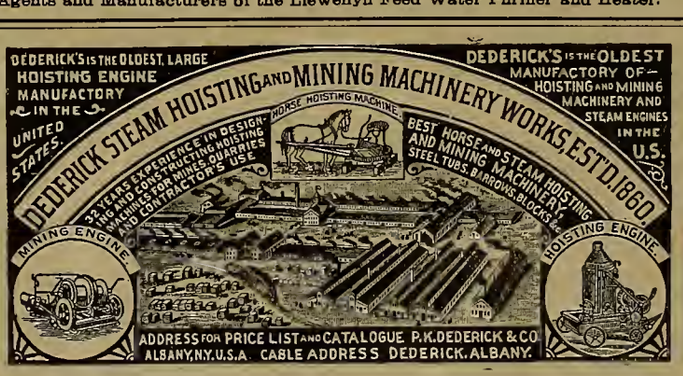
ONE of the latest products of American skill and ingenuity is the new form of machine for cleaning and polishing shoes. It consists of a strong platform, with a supporter for the person's body, while in the center of the frame are two openings into which the shoes are received. After the feet are in place shields are applied, surrounding the upper part of the shoe, and preventing the hlacking from getting on this portion of of the footgear. The brushes, which consist of four arranged vertically for the side of the foot and two working horizontally for the heel and toe, are then set in motion hy steam power. First the shoes are polished, then the hlacking, taken from movable hoxes hy an automatic device, is applied, and afterward the polishing is finished. According to the St. Louis *Republic*, the inventor looks forward to a great future for his labor-saving device, notwithstanding that the trade is at present largely in the hands of foreigners, who are not given to a consideration of mechanical devices.

PACIFIC ROLLING MILL CO.,
.....MANUFACTURERS OF.....
Cast Steel Castings and Steel Forgings
UP TO 20,000 LBS. WEIGHT.
True to pattern and superior in strength, toughness and durability to Cast or Wrought Iron in any position or for any service.
GEARINGS, SHOES, DIES, CAMS, TAPPETS, PISTON-HEADS, RAILROAD and MACHINERY CASTINGS of Every Description.
— ALSO —
HOMOGENEOUS STEEL, SOFT and DUCTILE, SUPERIOR TO IRON FOR LOCOMOTIVE AND MARINE FORGINGS.
ALSO Steel Rods, from ¼ to 8 inch diameter and Flats from 1 to 8 inch. Angles, Tees, Channels and other shape Steel Wagon, Buggy, and Truck Tires, Plow Steel; Machinery and Special Shape Steel to size and lengths STEEL RAILS from 12 to 45 pounds per yard. ALSO, Railroad and Merchant Iron, Rolled Beams, Angle, Channel, and T Iron, Bridge and Machine Bolts, Lag Screws, Nuts, Washers, Ship and Boat Spikes; Steamboat Shafts, Cranks, Pistons, Connecting Rods, etc. Car and Locomotive Axles and Frames, and Iron Forgings of all kinds, Iron and Steel Bridge and Roof Work a Specialty.
HIGHEST PRICE PAID FOR SCRAP IRON AND STEEL.
☞ Orders will have prompt attention. Send for Catalogues. Address
PACIFIC ROLLING MILL CO., 202 Market St., San Francisco.

FULTON IRON WORKS,
HINCKLEY, SPIERS & HAYES, Proprietors.
[ESTABLISHED IN 1855.]
Office, 218 Fremont St., San Francisco.


TUSTIN'S PULVERIZER.
—MANUFACTURERS OF—
MARINE ENGINES AND BOILERS.—Propeller Engines, either High Pressure or Compound, Stern or Side-wheel Engines.
MINING MACHINERY.—Hoisting Engines and Works, Cages, Ore Buckets, Ore Cars, Pumping Engines and Pumps, Water Buckets, Pump Columns, Air Compressors, Air Receivers, Air Pipes.
MILL MACHINERY.—Batteries for Dry or Wet Crushing, Amalgamating Pans, Settlers, Furnaces, Retorts, Concentrators, Ore Feeders, Rock Breakers, Furnaces for Reducing Ores, Water Jackets, etc.
MISCELLANEOUS MACHINERY.—Flour Mill Machinery, Saw Mill Engines and Boilers, Dredging Machinery, Powder Mill Machinery, Water Wheels.
Tustin's Pulverizer
WORKS ORE WET OR DRY.
ENGINES AND BOILERS
OF ALL KINDS,
Either for use on Steamboats or for use on Land.
Water Pipe, Pump or Air Columns, Fish Tanks for Salmon Canneries
OF EVERY DESCRIPTION.
Boiler Repairs Promptly attended to and at very moderate rates.
AGENTS FOR THE PACIFIC COAST FOR THE
Deane Steam Pump.


DEANE STEAM PUMP.
SPECIALTIES:
Corliss Engines and Tustin Ore Pulverizers.
Agents and Manufacturers of the Llewellyn Feed Water Purifier and Heater.



DEDERICK'S IS THE OLDEST, LARGE HOISTING ENGINE MANUFACTORY IN THE UNITED STATES.
DEDERICK'S IS THE OLDEST MANUFACTORY OF HOISTING AND MINING MACHINERY AND STEAM ENGINES IN THE U.S.
DEDERICK STEAM HOISTING AND MINING MACHINERY WORKS, EST'D 1860.
HORSE HOISTING MACHINE.
BEST HORSE AND STEAM HOISTING AND MINING MACHINERY, STEEL TUBS, BARROWS, BLOCKS, ETC.
40 YEARS EXPERIENCE IN DESIGNING AND CONSTRUCTING HOISTING MACHINES FOR MINES, QUARRIES AND CONTRACTORS' USE.
MINING ENGINE.
HOISTING ENGINE.

Adamantine Shoes and Dies
—AND—
CHROME CAST STEEL
Cams, Tappets, Bosses, Roll Shells and Crusher Plates.

STAMP SHOES.

STAMP DIES.

THESE CASTINGS ARE EXTENSIVELY USED IN ALL THE MINING STATES and Territories of North and South America. Guaranteed to prove better and cheaper than any others. Orders solicited subject to above conditions. When ordering send sketch with exact dimensions. Send for Illustrated Circular.
Manufactured by CHROME STEEL WORKS, Brooklyn, N. Y.
H. D. MORRIS, Agent, 220 Fremont St., San Francisco.
Special attention given to the purchase of Mine and Mill Supplies.
Stamp Cam.

DEWEY ENGRAVING COMPANY,
Engravings made from photographs, drawings and original designs, for newspaper, book, card and job printing. Engraved prints enlarged or reduced, cheaply and quickly. Also copies of manuscript, legal documents, wills, contracts, signatures, portraits, buildings, machinery and printed documents reproduced with accuracy. Photographs, stereoscopic views, etc., duplicated, enlarged or reduced. Slides for magic lanterns made from photographs lithographs, and steel or wood engravings, etc. Satisfaction guaranteed. Agents wanted in all cities and in all towns. Address, for further information, DEWEY ENGRAVING CO., 220 Market St., San Francisco.

Langbein's New and Splendid Book on the Electro-Deposition of Metals.

RECENTLY PUBLISHED.

A COMPLETE TREATISE ON THE

Electro-Deposition of Metals

Comprising Electro-Plating and Galvanoplastic Operations, the Deposition of Metals by the Contact and Immersion Processes, the Coloring of Metals, the Methods of Grinding and Polishing, as well as Descriptions of the Electric Elements, Dynamo-Electric Machines, Thermopiles, and of the Materials and Processes used in every Department of the Art. Translated from the German of Dr. George Langbein, with additions by William T. Brannt, editor of the "Techno-Chemical Receipt Book." Illustrated by 125 engravings. In one volume, 8vo, 404 pages. Price.. .. ..$4.00

☞ *Free of postage to any address in the world.*

Abstract of Contents.

I. GENERAL HISTORICAL PART. CHAPTER I, HISTORICAL REVIEW OF ELECTRO-METALLURGY. II. THEORETICAL PART. CHAPTER II. MAGNETISM AND ELECTRICITY. 1. Magnetism. II. Electricity; Electro-Magnetism; Induction; Chemical Actions of the Electrical Current—Electrolysis. III. SOURCES OF CURRENT. CHAPTER III. GALVANIC ELEMENTS; THERMO-PILES; MAGNETO AND DYNAMO ELECTRIC MACHINES. IV. PRACTICAL PART. CHAPTER IV. ARRANGEMENT OF ELECTRO-PLATING ESTABLISHMENTS IN GENERAL; ELECTRO-PLATING ARRANGEMENTS IN PARTICULAR. V. TREATMENT OF THE METALLIC ARTICLES. (a) Mechanical Treatment; (b) Chemical Treatment. VI. PROCESSES OF ELECTRO-DEPOSITION; REDUCTION OF METALS WITHOUT A BATTERY (Electro-Deposition by Contact). VII. DEPOSITION OF NICKEL AND COBALT. I. Nickeling. 2. Cobalting. VIII. DEPOSITION OF COPPER, BRASS AND BRONZE. 1. Coppering; 2. Brassing (Cuivrepoll Deposit); 3. Broozing. IX. DEPOSITION OF SILVER. X. DEPOSITION OF GOLD. XI. DEPOSITION OF PLATINUM AND PALLADIUM. 1. Deposition of Platinum; 2. Deposition of Palladium. XII. DEPOSITION OF TIN, ZINC, LEAD AND IRON. I. Deposition of Tin. 2. Deposition of Zinc; 3. Deposition of Lead; 4. Deposition of Iron (Steeling). XIII DEPOSITION OF ANTIMONY, ARSENIC AND ALUMINUM. 1. Deposition of Antimony; 2. Deposition of Arsenic; 3. Deposition of Aluminum. XIV. GALVANOPLASTY (Reproduction). 1 Galvanoplastic Deposition in the Cell Apparatus; 2. Galvanoplastic Deposition by the Battery and Dynamo Machine. XV. COLORING, PLATINIZING, OXIDIZING, ETC., OF METALS, LACQUERING. XVI. APPARATUS AND INSTRUMENTS. XVII. HYGIENIC RULES FOR THE WORKSHOP. XVIII. CHEMICAL PRODUCTS USED IN THE ELECTRO-PLATING ART. XIX USEFUL TABLES INDEX.

☞ *A circular of 6 pages quarto, giving the full Table of Contents of this important Book, with specimens of the illustrations, will be sent free of postage to any one in any part of the world who will furnish his address*

☞ *Our New and Enlarged Catalogue of Practical and Scientific Books, 88 pages, 8vo, and our other Catalogues, the whole covering every branch of Science applied to the Arts, sent free and free of postage to any one in any part of the world who will furnish us with his address.*

Dewey & Co.'s Scientific Press Patent Agency.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most *reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free.

SCIENTIFIC PROGRESS.

The Leblanc and Ammonia Soda Process.

For more than a century the Leblanc process for making soda ash and salt cake held undisputed sway. In this process, as is well known, sulphate of soda, black ash or salt cake, as the product is called, is made from salt by the action of sulphuric acid upon it. This sulphate is changed into soda ash or carbonate of soda by the action of powdered carbon, usually in the form of charcoal and heat. A few years ago the ammonia soda process was invented. No sulphate or black ash is made; the salt is converted into carbonate by the action of ammonia.

For a while the ammonia process made rapid strides, and it seemed as though it would entirely supplant the older and more expensive Lablanc process. The competition was so fierce that the Leblanc soda ash was for many months sold below cost, while the ammonia soda makers were not losing money. The Leblanc people only saved themselves from bankruptcy by the sale of salt cake, and certain by-products that were not made by the ammonia process.

In the last three years, however, in Great Britain, at least, the Leblanc process has more than held its own, as will be seen from the following table showing the salt decomposed in Great Britain in 1889 to 1891 by each of these two processes:

Salt decomposed in the Leblanc and ammonia soda processes in Great Britain 1889–1891, in tons of 2240 lbs.:

	1891.	1890.	1889.
Leblanc process	567,863	602,769	584 203
Ammonia process	278,528	252,260	219,279
Total	846,391	855,029	803,482

One reason why the Leblanc process has held its own is the demand for sulphate or black ash by the glassmaker. It has been found that as good, if not better results, have been obtained by using salt cake and carbon in the glass pot instead of the soda ash. The same reaction takes place in the pot between the carbon and salt cake as in the furnace of the sodamaker, and these reactions in the pot seem to improve and aid the process of glass-making.—American Manufacturer.

Paper Manufacture.

The United States Consul-General at Seoul, in his last report, says that paper manufacture is one of the leading industries of Corea. This paper is highly esteemed, and always forms part of royal presents, and of the tribute paid to China. Besides its use for writing and for books, it is employed in a great diversity of ways. It serves as string and in the manufacture of lanterns, fans, umbrellas, shoe soles, hats, boxes, and coats. It is also used for covering floors, walls, and ceilings, and, stretched on frames, supplies windows and doors. It is highly prized in China and Japan, and is especially sought after for the manufacture of umbrellas. It is made from the bush of the mulberry order (*Broussonetia papyrifera*), which is indigenous, growing in many parts of the kingdom, but thriving best in the moist, warm climate of the south. It is chiefly grown from cuttings for this especial purpose, and the wild and cultivated plants are said to be of equal value. The bark, which alone is used, is generally gathered in the spring, and it is boiled for a long time in water, in which a quantity of wood ashes has been mixed, until it becomes a pulp, the mass having been beaten during the whole time of the boiling. Fine bamboo screens are then placed in shallow wooden vats, and a ladleful of the pulp is evenly spread over the screen by a dexterous circular motion of the hand. This operation is repeated once or twice, or as often as may be necessary—the more frequent the operation, the finer the paper—and the screen allowed to drain into the vats, until a proper consistency is reached, the drippings being thus saved. They are placed on a hot *kang* floor to dry. After the drying has proceeded far enough, the paper is laid on a hot floor, and ironed by hand. The long lines in the paper show strands of the bamboo screens, and their nearness, distinctness or absence indicate the fineness or otherwise of the paper. They are almost imperceptible in some grades of paper, while in others they are distinct and far apart. Paper is made by the Paper Guild, a numerous and prosperous association. The province of Chulla is the chief seat of manufacture.—Science.

OZOKERITE.—An important memoir on the petroleum and ozokerite of Galicia, by Mr. Boverton Redwood, appears in the *Jour. Soc. Chemical Industry* (Vol. XI, No. 2). Petroleum occurs in the "Carpathian sandstones," the upper member of which is Eocene, the lower being Neocomian; in the upper Eocene or Oligocene; and in the Miocene beds. Ozokerite is found in small quantities in the older strata, but the main deposits are in the Miocene of Boryslaw. This material is extracted by shafts; while the petroleum is pumped from bore-holes. The strata are much folded, and are sometimes slightly inverted. The more productive areas for petroleum are frequently along anticlinal folds. Mr. Redwood's memoir is rendered much more valuable by the addition of a general map of Europe, on which all the principal petroleum fields are marked.

Fuse Wire.

The fuse wire department of the Sperry Electric Mining Machine Company, Chicago, is discovering many interesting facts in testing its product. Any person familiar with the fuse wire market cannot have failed to notice the very material difference in the length of fuses recommended by different makers. For instance, 100-ampere links may be found on the market varying from one to eight inches in length, and there is a corresponding disparity in other sizes. Doubtless the shortest fuse which will act perfectly under all circumstances is the one to be recommended, but just what relation the length bears to the fusing point is a feature in fuses that the Sperry Company has been investigating. To show the actual variation in fusing point for different lengths the following examples are given: Wire rated as 5-ampere safe carrylng capacity in 1¾-inch length, fuses at 10 amperes, while in ½-inch length at 19 amperes, 10 amperes in 2¼ length fuses at 18 amperes, in ¾-inch length at 29½ amperes, 50 amperes in 3-inch length fuses at 72½, in 1-inch length at 110 amperes, 200 amperes in 4¾-inch length fuses at 224 amperes, in 1-inch length at 316 amperes. It will be seen from the above that in the small sizes a large percentage of allowance is made between safe carrying and fusing points, as the danger element is small and the unnecessary blowing of a fuse troublesome. As the capacity increases the percentage is lowered, until at 500 amepres but 10 per cent of allowance is made. It must be understood, however, that the results in case of the short fuses are dependent in a large measure on the terminals, and this element of uncertainty is inevitable whenever such fuses are used, since it is impossible for the manufacturer to anticipate what sized terminals will be used by the station superintendent.—Western Electrician.

THE DIAMETER OE FULGURITES.—When a bolt of lightning strikes a bed of sand, says an exchange, it plunges downward for a distance, less or greater, transforming simultaneously into glass the silica in the material through which it passes. Thus, by its great heat, it forms at once a glass tube of precisely its own size. Now and then such a tube is found and dug up. Fulgurites have been followed into the sand by excavations for nearly 30 feet. They vary in interior diameter from the size of a quill to three inches or more, according to the bore of the flash. But fulgurites are not alone produced in sand; they are found also in solid rocks, though very naturally of slight depth and frequently existing merely as a thin glassy coating on the surface. Such fulgurites occur in astonishing abundance on the summit of Little Ararat, in Armenia. The rock is soft, and so porous that blocks a foot long can be obtained, perforated in all directions by little tubes filled with bottle-green glass formed from the fused rock.

PLATE GLASS EXAMINATION.—The United States Consul at Antwerp, in a description of plate glass manufacture in Belgium, states that, after polishing, the plates are taken to the chamber for examination, a room hung entirely in black and which receives a ray of light from the east by an opening at the height of from 1.5 to 2 meters, according to the size of the plates to be examined. The plate is placed vertically upon a table covered in black, so as to receive a ray of light at an angle of 45°. By such an installation every imperfection, such as scratches, air bulbs, etc., which may exist is immediately discovered, while in full light they would not be seen. The plates especially designed for mirrors and to be silvered receive a second examination in a dark room, which receives the light only through an opening of 25 to 50 centimeters and at a height of about 2½ meters. The plate is on a black table and receives the light from the east at an angle of 45°, and is moved by hand so as to receive the light upon its entire surface.

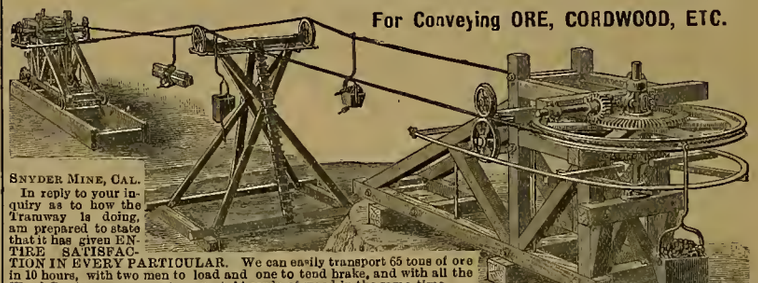
VULCAN WIRE ROPEWAY,
For Conveying ORE, CORDWOOD, ETC.



SNYDER MINE, CAL.
In reply to your inquiry as to how the Tramway is doing, am prepared to state that it has given ENTIRE SATISFACTION IN EVERY PARTICULAR. We can easily transport 65 tons of ore in 10 hours, with two men to load and one to tend brake, and with all the Wood Carriers on, we can transport 14 cords of wood in the same time.
When I look back upon the time when I was paying at the rate of $2.50 per ton for hauling ore, whereas it is now done at the rate of 12½c. per ton, making a **saving of $150 per day**, and also, where it formerly cost me $5.00 per cord for wood delivered at mill, it now costs me but $3 per cord, making a saving of $2.50 per cord—I must say that I feel pretty well over my Tramway investment for it is a PERFECT SUCCESS.

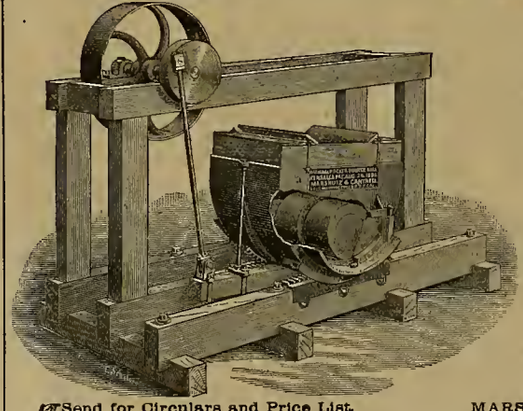
CAPACITY, 12 Tons in 24 Hours. 3 H. P.
MARSHUTZ & CANTRELL, Sole Manufacturers.



The Patentee and Manufacturers cordially invite miners to critically examine and pass judgment upon this improved system of milling and amalgamating ores in the following particulars:
1. The cost is less than one-half of stamps of same capacity.
2. The freight to mine is less than one-half of stamps.
3. The cost of erecting is less than one-fourth of stamps.
4. The power to drive it is less than one-half of stamps.
5. The wear is less than one-quarter of stamps.
6. There is no wear except on shoes and dies.
7. In point of amalgamation it is superior to any other machine in use.
8. In its simplicity of construction.
We challenge competition with Stamps, Ball Pulverizers or and other ore crushing machines now before the public.
Send for Circulars and Price List. MARSHUTZ & CANTRELL.

FRUE ORE CONCENTRATOR

OVER 3200 IN ACTUAL USE.

Manufactured under Patents of April 27, 1880; September 18, 1883; July 24, 1888; and March 31, 1891.

GLADSTONE MINING COMPANY, C. J. Clark, M. E. Gen'l. Supt. FRENCH GULCH, Cal veras Co., Cal., Dec. 12, 1891.

MESSRS. ADAMS & CARTER, San Francisco, Cal.—DEAR SIRS: During my experience in mining and milling, I have used twenty-four of your four-foot Frue Vanners on different kinds of ore, both gold and silver. I have made competitive tests against them with other widely puffed-up concentrators and have always found the FRUE in first place. When I built this mill (20 stamps), I determined to put in six-foot Frues in order to save space and machinery. I am now running four of your six-foot machines and they have been going for TWELVE MONTHS. They are taking the pulp from 20 stamps, crushing a minimum of fifty tons per day, and do better work than the four-foot tables. They require no more attention than a four-foot table and handle at least twice the quantity of ore. I have run them up to 80 tons per day and could not see that they were crowded. They stop and start as easily as the smaller tables and have the advantage of double capacity with the same bearings and wearing parts, requiring no more oil, and no more wear and tear than the smaller tables. My repair account for the past six months has been too small to mention. In order to give an idea of the work they are doing here I will state that the ore has varied monthly from $5 to $20 per ton and the tailings from nothing to 60 cts. per ton. I will conclude by saying that I cannot endorse the six foot Frue Vanner too highly, and it is the only table that I would have in my mill.

C. J. CLARK, Gen'l Supt.

Price of 4-foot wide Plain Belt Frue Vanner..... $550, f. o. b.
" " " Improved Belt Frue Vanner..... 800, f. o. b.
" 6-foot " Plain Belt Frue Vanner..... 800, f. o. b.

ADAMS & CARTER, Agents FRUE VANNING MACHINE CO.,
No. 182 Market Street. - - - San Francisco, Cal.

"TRIUMPH" ORE CONCENTRATOR WITH IMPROVED RIFFLED BELT.

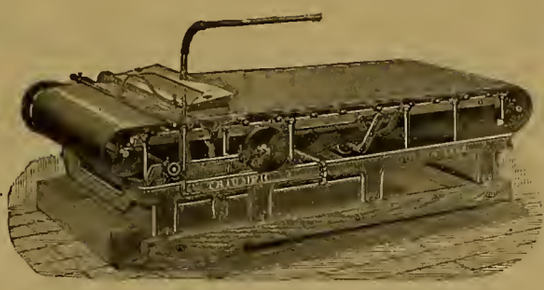
The competitive trials which have been held between the Triumph" Ore Concentrators, the "Frue" Vanners and other forms of concentrating devices, do not warrant the assertion that the "Frue" Vanner is the best ore concentrator in the market. The fact that the "Frues" have improved (corrugated) belts does not militate against the superiority of the "Triumphs;" for, when desired, they (the "Triumphs") can be mounted with a superior belt known as the "Blasdel" Riffled.

—o—

Price "Triumph" Concentrators, with Improved (Patented) Belt - - - $650 f. o. b.
Price "Triumph" Concentrators, with Plain Belt - - - - - - - $550 f. o. b.

—o—

We are prepared to guarantee the superiority of the "Triumph" over the "Frue" or any other form of Concentrator, for coin if need be. Circulars and testimonial letters furnished on application.



JOSHUA HENDY MACHINE WORKS,
39 to 51 Fremont Street, San Francisco, Cal.

(PATENTED.)

Both the "Trinmph" Concentrator and "Blasdol" (riffled) Belt are protected by incontestable letters patent, granted by the Government of the United States.

Location of Works, Grass Valley, Nevada Co., Cal.

GRASS VALLEY, NEVADA CO., CAL., Nov. 10, 1885.

Joshua Hendy Machine Works, 39 to 51 Fremont St., S. F., Cal.:

GENTLEMEN—I am pleased to state, in reference to the "Triumph" Ore Concentrators, that four (4) of them were placed in the mill of the Original Empire Mill and Mining Company in April, 1884, and a thorough test made of their practical operation; and their efficiency having been demonstrated, four (4) more were subsequently introduced as the complement of the Twenty (20) Stamp Mill, and the eight (8) have been and are now running with entirely satisfactory results.

At the Ten (10) Stamp Mill of the North Star Mining Company, under my supervision, four (4) are also in successful operation, and from my observation of their practical workings, I am convinced that this form of Concentratore is the equal, if not superior to any other style of Vanners or concentrating devices. DAVID McKAY, Jr.,

Signed] Sup't North Star and Original Empire Mining Co.

N. B. When the stamping capacity of the two above named mills was increased, more "Triumph" Concentrators were purchased, and twenty-eight (28) are now in constant successful operation.

PLACER AMALGAMATORS

Combined with Steam Shovel or Dredge.

BUCYRUS SYSTEM.

NEW METHOD OF PLACER MINING.

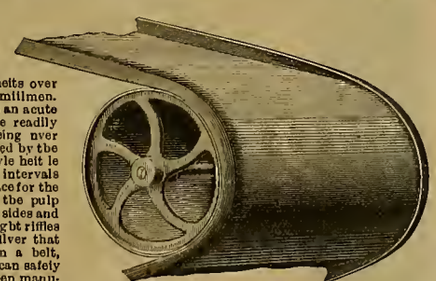
Saves all the Gold. Uses very little Water. Treats large quantities at Low Cost.

—BUILT SOLELY BY THE—

BUCYRUS STEAM SHOVEL AND DREDGE COMPANY,
BUCYRUS, OHIO, U. S. A.

THE BLASDEL CONCENTRATING BELT COMPANY.

We have now made arrangements to have our new Improved Concentrating Belt manufactured in San Francisco. We keep always on hand Belts suitable for the Triumph and Frue machines, but can make any length or width desired. The advantages of these belts over *any others* will be readily seen by practical millmen.



First, the flanges or edges of our belt stand at an acute angle inclining toward the center, and therefore readily conform to the change of direction while passing over the end rollers; thus the vexation and loss caused by the frequent breaking of the flanges of the old style belt is practically done away with. Again, our belts, at intervals of two to four feet, have a very slight riffled surface for the space of three inches, which tends to equalize the pulp on the belt, and prevents it from banking on the sides and forming channels through the center. These slight riffles also save very fine sulphurets and the quicksilver that would otherwise escape with the tailings from a belt, the surface of which is entirely smooth. We can safely say that it is a better belt than has ever been manufactured for use on this coast. It will last much longer and will handle fully one-third more pulp than any smooth belt, and will save a higher percentage of sulphurets

H. G. BLASDEL, Jr., Manager, 419 California St., San Francisco.

ELECTRICITY.

The Frankfort-Lauffen Experiments.

It is now just ten years ago that Marcel Deprez demonstrated, in a practical way, the possibility of transmitting energy electrically with a degree of efficiency over long distances heretofore unattainable by other methods; and though the total amount of power received at Munich from Miesbach, 37 miles off, was barely half a horse power, the experiment served to show that the method, as a rule, was feasible. The last ten years have more than confirmed the estimate of the results then obtained, but it remained to show how far the progress made in the modern applications of high potentials could be applied to this same problem of long-distance transmission. There were not a few who shook their heads at the thought of using 30,000 volts on a line over 100 miles in length, and subject to many adverse conditions under which overhead lines labor. Again, the probable loss in the line itself, due to its electrostatic capacity, was a matter of conjecture by no means favorable to a successful issue. Again, while few doubted the possibility of constructing transformers capable of standing a pressure of 30,000 volts, the fact remained to be demonstrated. But the success of the experiments is confirmed by the official report of the testing committee, part of which is now given to the public. Taking a few representative figures among the tests, we find that with 78 h. p. applied to the dynamo by the turbine, 53.5 h. p. or 68.5 per cent was delivered by the second transformer at the distant end, 109 miles off; with 150 h. p. at Lauffen, an efficiency of 75.3 per cent was reached, and with 197.4 h. p., 73.9 per cent. These experiments were carried on in all sorts of weather, and though the potential employed is not given in the tables thus far published, it is safe to say that it was probably not below 15,000 volts. Considering the fact that the transmission included two transformations in converters, together with the loss in the dynamo and in the line, the result obtained is excellent proof of the high order of construction embodied in the apparatus employed and reflects credit on both parties to the undertaking—the Allgemeine Elektricitats-Gesellschaft, of Berlin, and the Oerlikon Maschinenfabrik, of Oerlikon, Switzerland. Electrical Engineer.

Electrical Rapid Transit.

There is something stupendous about the idea of constructing before May, 1893, an electrical express line 250 miles long between Chicago and St. Louis, and equipping it with all the necessary apparatus for the transportation of passengers. *Electric Power* says that the difficulties in the way are mainly electrical in their nature, as the construction of the roadbed is merely the question of employing men enough to do the work. The railroad engineers have already done their part of it by surveying an absolutely straight road from one city to the other. But the electric portion of the system will require, besides the absolute time employed in the manufacture of the electrical apparatus, a good deal of engineering work in order to determine the best forms and proportions. The author of the system, Dr. Wellington Adams, has no doubt, however, that the whole equipment will be ready in time for the opening of the World's Fair next year.

In a lecture delivered before the New York Electric Club, Dr. Adams gave the mechanical details with cooiderable fullness. Moreover, the general features of the electrical system were set forth as of the multiphase type, the generator being like the one that was used at the Frankfort-Lauffen power installation. It is to be regretted that the details of the motor were not added, but we presume they were withheld for good reasons.

In the course of the discussion which followed Dr. Adams' lecture, Professor George Forbes of London called attention for the first time, so far as we have observed, to the advantages of a perfectly straight line for electrical high-speed service on account of the freedom which it guarantees from the effects of the gyroscopic action of the wheels and motors. The effect of this action in tending to throw electric engines off the track while rounding curves is certainly worthy of being noted. Since it acts in the same direction as the centrifugal force Professor Forbes suggested as a means of counteracting the gyroscopic action that two motors, attached one above the other to the same solid framework, should be employed and both of them geared together revolving at the same rate. In that case the gyroscopic action of the two, so far as it relates to the framework itself, would be opposed. There are other ways of offsetting the effects of gyroscopic action, and now that attention has been called to it we shall have suggestions from other inventors.

Oil vs. Air as Insulation.

At the recent meeting of the American Institute of Electrical Engineers, Dr. James B. Williams of New York (formerly of San Francisco) read a very interesting paper on "Oil versus Air as Insulation," in which he reported a number of experiments going to upset entirely the idea as to the higher insulating qualities of oil—so far as they went. The paper was not presented in print, and its discussion was therefore adjourned until the fall, when Dr. Williams will repeat his experiments before the institute not only with air and oils but with a number of the leading insulations now known to commerce.

The facts set forth in this paper were obtained wholly from experiments and tests made by the doctor in New York City and by himself and his brother, R. W. Welty, in California while they were making the investigation of insulating material and its uses, which is now being described in a serial in this journal. These experiments and tests were made with special apparatus designed and made by Dr. Williams for testing insulating material by means of charges of high potential; and the results obtained are worthy of careful consideration on account of the perfection of this apparatus. The results show that, when used to insulate conductors carrying high-tension *constant* currents: 1. Air even with a humidity of 80 per cent is far superior to oil. 2. That air is superior to pure paraffine. 3. That steam will conduct such currents, but is superior to oil. 4. A film of oil on glass and porcelain will not prevent surface leakage. 5. Oil, if placed on paraffined hard rubber, at once ruins the surface insulation of that material. Other subjects treated of were: 1. The expansion of oil in pipes or tubes. 2. The use of fibrous material in combination with oil. 3. Absorption of moisture by oil.

Reference was also made to some new forms of insulated conductors invented and patented by the doctor, in which dry air in combination with other insulating material is used to form the dielectrics thereof.

ELECTRIC LOCOMOTIVES.—The 1200-h. p. electric locomotives, which the Thomson-Houston Co. is building to operate trains on the Baltimore Belt Line tunnel, will have four pairs of driving wheels and will weigh 80 tons. The *Electrical World* states that there will be a separate 300-h. p. motor for each axle, the armature being keyed directly to the axle. The current will be taken from a third rail of iron or from a large copper tube, by some form of sliding contact. The conductor will be thoroughly insulated, and will be supplied with feeders at frequent intervals. The potential used will be 500 volts. Two of the locomotives are expected to be in steady use, the third being held in reserve. The electricity will be generated at a central power station, where four compound Corliss engines of about 750-h. p. each will drive direct the coupled dynamos. The train movement in the tunnel will be about 400 trains daily. Besides hauliog this, it is intended to employ the electric locomotives as pushers for heavy freight trains on a 1½ per cent grade, just beyond the tunnel. The results of the experiment will be watched with great interest. The load on the central station of an ordinary electric railway is variable enough; but the variations in this case will be such as in a common installation is sufficient to cause a wreck. The governing arrangements will need to be remarkably perfect to cope with the sudden throwing on or off of a load of 2400-h. p., or the total load on the central station.—Engineering News.

ELECTRIC SAND. — "Electric sand" is the name of a new substance for which some extraordinary claims are made. Word has been received from the Wright Universal Electric Company of New York, by the *Western Electrician*, that after many years of investigation and experiment, it is now enabled to present to the trade a new product. "Electric sand" is described as a simple compound resembling sand, but which is as solnble in water as sugar. When the Wright battery is charged with the sand and water, the generation of the current is instantaneous. It is stated by the company that the chemical action on the zinc and carbon plates is not attended with the formation of crystals, thus obviating the cessation of action of the battery by reason of insulation due to crystallization. The current generated by electric sand, this company claims, is absolutely and perfectly harmless in any of its appliances.

Educational.

GAS WORK A SPECIALTY.

A. S. GRANT. S. B. CONNOR.
CONNOR & GRANT,
Millwrights and Engineers
303 California St., San Francisco.
Designers, Constructors, and Contractors for the Erection and Equipment of GOLD AND SILVER MILLS, HOISTING AND PUMPING WORKS, TRAMWAYS, and everything pertaining to the Mining and Reduction of Ores.

BOOKS ON ASSAYING.
By C. H. AARON.
Part I.—Gold and Silver Ores.
SECOND EDITION—PRICE $1.
This work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist nor the practical miner can mistake his meaning.
The work, like Mr. Aaron's former publications ("Testing and Working Silver Ores," "Leaching Gold and Silver Ores") that have been "successfully popular" is written in a condensed form, which renders his information more readily available than that of more wordy and less conscientious writers. The want of such a work has long been felt. It will be very desirable in the hands of many.
Table of Contents:
Preface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assays; Examples of Dressing; The Melting in Crucibles; Scorification; Cupellation; Weighing the Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests for Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.
The volume embraces 130 12mo. pages, with illustrations, well bound in cloth; 1889. Price, $1, postpaid. Sold by DEWEY PUBLISHING CO., Publishers, No. 220 Market Street, San Francisco.

Parts II and III.
Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Etc.
SECOND EDITION — JUST OUT.
Price $1.75.
This book is entitled "Assaying—Parts II and III," and is separate from Part I, and treats of Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Zinc, Nickel, Cobalt, etc.
Table of Contents:
Gold and Silver Bullion; Apparatus; Melting Bullion; Assaying Bullion; Humid Assay of Silver; Gay Lussac's Method; Volhart's Method; Manipulation; Lead Ores; Copper Ores; Tin Ores; Mercury Ores; Zinc Ores; Nickel and Cobalt; Chromium; Bismuth; Arsenic; Antimony; Sulphur; Salt; Note.
One of the methods given for the Assay of Copper is new, original and exact, as is also one of the processes for Zinc.
The book contains 161 pages with illustrations, and is strongly bound in cloth. Much of the original text is replaced by new matter.
Price, postpaid, $1.75. Sold by DEWEY PUBLISHING CO., Publishers No. 220 Market St., San Francisco.

The Best Mining District
On the Pacific Coast!
GRASS VALLEY, CAL.
THE BEST NEWSPAPER published in the district is
THE TIDINGS,
Daily and Weekly edition. Gives all the Mining News. Dealers in Mining Machinery and Mining Supplies will find THE TIDINGS the best medium for directly reaching the owners or managers of mines. Investors in mines will find it to their advantage to subscribe.
Many mines are in successful operation, and new enterprises are being instituted and many others are in contemplation.
DAILY, $6.00 a year; WEEKLY, $2.50, *in advance.*

USEFUL INFORMATION.

LIMITS OF TREE-VEGETATION. — The latest researches of the Finnish expedition to the Kola peninsula will modify, as we learn from *Nature*, the position of the line which now represents on our maps the northern limits of tree-vegetation in that part of Northern Europe. The northern limit of coniferous forests follows a sinuous line which crosses the peninsula from the northwest to the southeast. But it now appears that birch penetrates much farther north than the coniferous trees, and that birch forests or groves may be considered as constituting a separate outer zone which fringes the former. The northern limits of birch groves are represented by a very broken line, as they penetrate most of the valleys almost down to the seashore; so that the tundras not only occupy but a narrow space along the seacoast, but they are also broken by the extensions of birch forests down the valleys. As to the tundras which have been shown of late in the interior of the peninsula, and have been marked on Drude's map in Berghaus' atlas, the Finnish explorers remark that the treeless spaces on the Ponoi are not tundras but extensive marshes, the vegetation of which belongs to the forest region. The Arctic or tundra vegetation is thus limited to a narrow and irregular zone along the coast, and to a few elevated points in the interior of the peninsula, like the Khibin tundras, or the Luyavrurt (1120 metres high). The conifer forests, whose northern limit offers much fewer sinuosities than the northern limit of birch-growths, consist of fir and Scotch fir; sometimes the former and sometimes the latter extending up to the northern border of the coniferous zone.

WHY COAL COKES.—By some German chemists tests have been made to ascertain the physical cause of the coking or fusing of bituminous coal into the form of coke, under distilling heat, the conclusion being that such a phenomenon is connected with the chemical composition of the coal, with especial relation to the richness of the coal in what is called disposable hydrogen, or that proportion of it which is in excess of the quantity required to form water with the oxygen present. It has recently been asserted, however, that such a standard for the coking quality in coal does not correspond with observed results, nor does the richness of a sample of coke in carbon determine its coking capabilities, the fact being that two specimens of coal of practically identical carbon composition will often be found to behave very differently in the retort of coke ovens. It is argued, therefore, that if the property of coking does not reside either in the surplus hydrogen or the fixed carbon, it is certainly not to be found in the content of the coal in oxygen, which gives no indication whatever of the physical behavior of the coal under heat. Some coking coals coke without much swelling, while others swell to a considerable extent during the process. In either case the coal must undergo a state of fusion, in which it becomes a think, semifluid mass, through which the gas escapes.

REFINING COPPER.—The air of mystery that has for a long time surrounded the processes for the electrolytic refining of coppers is, we are glad to note, being removed, and in a manner which leaves no room for doubt that in the near future this industry will occupy a leading position in the electric arts. Prof. Badt points out in his Institute paper that the principles are well established, and with proper attention to details success in this field is assured. With the immense mineral resources of the United States, which have already made it the largest copper-producing country in the world, it is not difficult to foresee the time when we shall supply foreign markets with electrolytically refined copper. That this can be done profitably is evidenced by recent shipments of such copper abroad, so that the producer is not entirely dependent upon home markets.—Electrical Engineer.

CARE OF THE FURNACE.—A suggestion to housekeepers who use furnaces is to have the tin heating pipes disconnected in the spring, thoroughly cleaned and stood upright in the cellar until fall. The soot and dust which accumulates in these pipes will, if left, rot away the inner lining and cause them to wear out much quicker than if properly cared for. The furnace should be carefully cleaned out and the tools used about it, poker, shovel, ash scraper, etc., looked up and put inside. If they are lying about the cellar they run the risk of being buried under the coal, usually put in during the summer, besides offering too great temptations to the boy of the house.

METALLURGY.

Qualitative Detection of Nickel and Cobalt.

The qualitative detection of nickel in presence of cobalt is often a difficulty with the beginner in the study of analysis. When the conditions are correctly understood, Liebig's cyanide separation—the essential details of which were fully worked out by Gauhe (*Zeit. fur Anal. Chem.*, 1866, p. 75) in 1866—is, in the writer's experience, the simplest and most rapidly executed. Although clearly stated by Fresenius in his "*Quantitative Analysis*," so far as I am aware there is not one of all the multitude of text-books on qualitative analysis in our language which recommends this method that does not introduce some unnecessary condition into the procedure, and in most cases the student's difficulties arise not from his own incapacity, but from the faulty description given by his text-book.

Although the subject is not original, it may therefore be useful to call attention to the simplest and most satisfactory method of working. Gauhe showed conclusively that the conversion of potassium cobaltous cyanide into the cobalticyanide by boiling with hydrocyanic acid (at best a dangerous experiment), is always incomplete; but that by means of a suitable oxidizing agent, in alkaline solution, the cobalt may be directly converted into the soluble cobalticyanide, the nickel being simultaneously precipitated as hydrated nickelic oxide. The method of detecting nickel in presence of cobalt is then as follows: Separate the mixed sulphides from the ammonium sulphide precipitate by means of cold dilute hydrochloric acid, and test a small portion in a borax bead. The presence or absence of anything more than a trace of cobalt is directly indicated by the coloration produced. Dissolve the sulphides in hot hydrochloric acid with the aid of potassium chlorate, boil off the excess of chlorine, and remove the excess of acid either by neutralization or evaporation to dryness. To the neutral solution add an excess of freshly prepared solution of potassium cyanide in cold water, beyond what is necessary to redissolve the precipitated cyanides. Boiling is unnecessary. Make the solution decidedly alkaline with sodium hydrate, add about twice the volume of bromine water, heat gently, allow to stand a few minutes, and filter off the precipitated nickelic oxide. The nickel may be confirmed by the borax-bead reaction after washing the precipitate.

The action of the oxidizing agent can be represented by equations, thus:

$$2KCN.Co(CN)_2 + 2KCN + Br = K_3Co(CN)_6 + KBr.$$

$$2KCN.Ni(CN_2 + 3NaOH + Br = Ni(OH)_3 + NaBr + 2KCN + 2NaCN.$$

There is no liberation of hydrocyanic acid at any stage of the process, so the operations may be safely conducted in the open laboratory. Commercial cobalt salts almost invariably give a precipitate of nickelic oxide. The cyanide method has the advantage over the precipitation of the cobalt as potassium cobaltinitrite, in that the separation is most frequently carried out with the object of detecting nickel, which metal is immediately separated as a precipitate readily available for examination.

If the analysis is to include a search for traces of cobalt, the alkaline filtrate from the nickel precipitate is, in the draught cupboard, acidified with excess of sulphuric acid, and evaporated until the excess of acid is nearly expelled. The residue is taken up with water, made alkaline with ammonium, the cobalt, if present, precipitated by ammonium sulphide, and confirmed by the borax bead. Or, a portion of the neutral solution containing the nickel may be treated with acetic acid and potassium nitrite, and the traces of cobalt directly precipitated by allowing to stand for a few hours.—Fred J. Hambly in Chemical News.

MANGANIFEROUS ORES FROM CARTHAGENA.—The exportation of dry iron ores and manganiferous ores from Carthagena, Spain, during 1891 was very small as compared with 1890, the total quantity exported amounting to 421,200 tons. This is a decrease of 402,900 tons as compared with 1890. A considerable portion of the iron ore mines were at intervals stopped from working for several months, from want of ore purchasers and from lack of space at the wharfs and depot, which were all overstocked, thus throwing numerous laborers out of work and causing the price of ore to come down. On the other hand, iron mining all through the district, it may be said, is steadily on the increase, some new mines having been opened during the year. The price of iron ore free on board steamer at Carthagena ranged during the last year from $1.30 to $1.70 per ton of 2240 pounds for 50 per cent of metallic iron contained in the ore, with a sliding scale of from 6 to 8 cents per unit in excess of that percentage. Manganiferous iron ore was sold, according to class and conditions of sale, at from $2 to $4 per ton, free on board at Carthagena. It was shipped as follows: To England, 198,273 tons; to the United States, 165,227 tons; to Holland, 40,400 tons; to France, 17,300 tons. The ore shipped to the United States may be classified as follows: Dry iron ore, 113,386 tons; manganiferous iron ore, 51,841 tons, with a full value, free on board, of $320,096.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

WORK SUSPENDED.—*Record*, July 21: W. G. Wharf, superintendent of the Goodwin mine, came down from the mine last week. He says it is impossible to tell when operations can be resumed. The sister at the East in whose favor Goodwin's will was made, has brought suit to set aside the bond which the present partie secured upon the property. Until the matter is settled in the courts no further work is likely to be done.

THE BELMONT MINE.—At the Belmont, the work of sinking the Boss shaft is proceeding under favorable headway. At the present depth of 180 feet, the bottom of the shaft (which is east of the main ore body) is in formation of a very encouraging nature.

MEN PUT TO WORK.—Six men were put to work yesterday at the Coyote gravel mine above Oleta. Two miners were sent up from this place.

CAREONDALE'S PROSPECTS.—Sacramento *News*, July 21: There is now good reason to believe that some of the plans for establishing a fire-brick and pottery manufactory at Carbondale will be carried out as projected, since the property has fallen into the hands of an English syndicate with plenty of capitel. It has been shown that all the necessary material is on the ground, and that all that is needed is the wealth with which to develop the natural resources of the place to make it one of the busiest places in the vicinity.

SUTTER CREEK.—Cor. Amador *Ledger*, July 23: Mining is moving along in its usual encouraging way. Getting the water out of the Hector is going on very satisfactorily. Mr. Taylor, the foreman, states that they are now nearing the 700 level, where they intend to call a temporary halt for the purpose of opening up two or three levels between the 200 and 600 foot levels, where they feel confident there is an abundance of good pay ore. By the 1st September they expect to have the mill once more in motion, which is expected to put an end to drawing on the treesury. Efforts will then be directed toward getting to the bottom and reaching out for a permanent paying mine. At the Belmont, good progress is being made with the sinking of the Boss shaft, and Mr. Tibbits, the superintendent, reports the formation in the bottom of the shaft of a very encouraging nature, and we hope soon to be able to report better news from that level. The work of crosscutting both east and west in the South Eureka is still progressing, with nothing new to report.

Butte.

MINING AT BANGOR.—Oroville *Register*, July 20: W. W. Will of the Bishop mine told us on Saturday last that mining would begin this week. Fifteen men would be put on the day shift at present, but in a short time this force would be doubled and a night shift would be put to work. Hay & Clark are putting up a 20-stamp mill and will be ready to begin crushing cement in about three weeks. At the Bisbop mine a rock breaker is used and then the gravel run through arrastres. It is thought 40 tons each 24 hours can be worked. Everything promises well in the various blue lead mines about Bangor, and the new companies that have been organized are pushing work lively.

Calaveras.

OUR MINING INTERESTS.—Calaveras *Citizen*, July 23: Almost daily flattering reports are received of the striking of new mines in and around this vicinity. The mines about El Dorado and Jesus Maria are looking up and at present considerable capital is being invested. The old McPherson mine, situated near El Dorado, is being put in working order and woodchopping for this mine has already begun. This is, without a doubt, a valuable piece of property. There are a great many fine lodes laying idle around us, merely for the want of capital to develop them. Should our mines be thoroughly opened once, we are satisfied they would be permanent and make lively places of our little towns. Gold tells, and wherever that article is found in paying quantities, money is plentiful, wages good and the people prosperous and happy. More encouragement should be given our prospectors and help the good cause along.

THE SHENANDOAH.—Considerable activity is being manifested at present in mining operations in the vicinity of Jesus Maria. At the "Shenandoah" or "Hoosier" mine we are informed that some flattering developments have been made lately, and that owing to the "pile" secured at a recent wash-up, the company has concluded to add 10 more stamps to the plant which they now have in operation, making a total of 20. Quite a force of new hands is being put on and we understand a number of the young miners of this city have secured positions there already.

MAYFLOWER.—Calaveras *Citizen*, July 23: The report is current upon our streets that the Mayflower mine, situated about a mile northwest of Sheep Ranch, has been sold recently to San Francisco parties. The price paid and the names of the purchasers have not been learned, although it is said Mr. Chas. Ross has been instrumental in the consummation of the sale. If this is true, the mining outlook here is again assuming favorable condition. The Mayflower mine has already been considerably developed and a large body of ore is now upon the dumps and, it is said, assays splendidly. There is no mill upon this mine and rumor says that the new company has received a backset in procuring a suitable mill site. It is to be hoped no one will be so obstinate as to throw a single obstacle in the way of encouragement to any mining enterprise here. The welfare of our town depends much upon more resources, and the sooner they are found and fostered the sooner will our prosperity increase. There is quite a revival in quartz mining at Sheep Ranch. Several mines have recently been bonded and it looks as though this section was occupying the attention of capitalists. Many a dollar in gold has been taken from the various mines around here, and it is evident that they are worthy of still further investigation.

Humboldt.

WHITE ROCK.—Cor. Blue Lake *Advocate*, July 23: Most every one in camp is busy. While the mines here may not pay very large dividends, yet they will compare favorably with any of the camps in this portion of the State, the amount of capital invested considered. Miller & Stone of the Sherwood mine have just completed a run of 75 tons of ore which we understand was satisfactory. Nicholson & Lees of the same mine have on their dump about 60 tons of ore, to which they are adding every day. It is a fine quality of rock, and will probably bring them in good returns. Fulmore & Miller (same mine) are not taking out any ore at present, but are drifting for air. The Sherwood is having the lower tunnel driven into the mountain as speedily as possible. It is in now over 200 feet. This tunnel will open the mine on a lower level than any yet run in on the ledge. They expect to have to go to quite a distance yet before pay ore is struck. Miller & Stone are driving their tunnel ahead in the expectation of striking a new chute beyond the break. D. M. Stoody is taking ore from the Brizard mine which the writer is informed is fairly good. James A. Gulick is working the Uncle Sam mine. Manuel Brown is doing the assessment work on the Grover Cleveland. G. W. Healy is working on the Mohawk mine. Messrs. Brooke & Tinsley are pushing work on the Mary Blaine. Clements & Ladd of the Mountain Boomer are still sluicing the old dumps, which we are led to believe are paying very well. Owing to the scarcity of water, they will shut down in a few days, but will commence operations underground. Some work is being done on the Tough Nut mine. Mr. Colgrove informs me that he will start the Excelsior on Monday. He has just finished a run of about 50 tons of rock through the mill. There is some talk of the Ridgeway starting up in the dim future, but no stated time is set. The Hardtack and the Hunter are idle. Mr. Mills, we believe, will begin the assessment work on the New York Helen in a short time. G. C. Sarvis of Eureka is working his mine at present. The placer miners on Pony creek are still working, but as water is getting short they will likely prepare for the coming winter. Mr. Yocum has just returned from a visit to Willow creek. He reports that the mine owners there expect to sell their property in the near future.

Kern.

RICH GOLD QUARTZ.—*Californian*, July 21: The Hitchcock brothers, who successfully mined on the Greenborn for some years, recently made an arrangement with A. J. Maltby near White river, by which they agreed to reopen one of his mines worked years ago, for a half interest in the property. There is now a working shaft 100 feet deep and a tunnel 150 long, and a fine ledge of ore has been uncovered. The last crushing of 38 tons, just made at the Tailbolt stamp mill, yielded $2600 in gold, and there is more in sight equally good.

OIL AND ASPHALT NOTES.—An oil tank car, the first of a number to be used by the Jewett & Blodget Oil Co. for transporting petroleum in bulk, has just been received. Two cars of maltha have been shipped this week, and two cars of asphalt for Eastern cities are now loading. The works at Sunset are taxed to their utmost capacity turning out asphalt to fill orders which its proven excellence has brought. Fresno now uses petroleum as fuel in its water, gas and electric light works, and two other power establishments are considering the desirability of its use. Fresno also manufactures gas for lighting from petroleum exclusively by the Lowe process, the same as used in Pasadena, and is discarding all coal in its works for any purpose. The retaining walls of the bridge over the Kespe river near Filmore are built of bowlders, with Kern county asphalt as mortar or cement. The Southern Pacific Company is alive to the advantages of California asphalt in railroad work, and is constantly experimenting in its uses.

Nevada.

THE LAFAYETTE MINE.—Grass Valley *Telegraph*, July 19: The report in the *Telegraph* of yesterday concerning the cleanup from the results of the crushing of the six loads of ore from the Lafayette mine was erronious. There were just six loads crushed, and they were crushed at the Rodgers mill in Boston ravine. The yield was $151.50 per load, not counting the "beadings." The mine is looking well throughout, and there is plenty more of such paying ore right now in sight.

DAISY HILL MINE.—Grass Valley *Tidings*, July 20: The Daisy Hill mine has been bonded from Frank Morse by George Mainhart and others, and a company has been organized in San Francisco to develop the property. The company is now about to commence operations, we understand. Geo. H. Gamble, a well-known San Francisco mining man is here on business connected with the enterprise.

SAUVEE MINE.—Negotiations looking to the development of the Sauvee mine, adjoining the W. Y. O. D., have been in progress for some time. To-day an agreement was entered into by which the property will be exploited by Eastern capital. Work will be commenced within a fortnight, it is understood.

MORE SPECIMENS.—The prediction made by the *Tidings* last week that the Peabody mine would undoubtedly yield a rich lot of specimens in a few days, was verified to-day, when a big boxful of rich ore was brought to town. The box is two feet long by a foot in width and depth, and the ore will yield, it is estimated, $10 per pound, or perhaps a dollar an ounce. The specimens came from the stope between the 300-foot and 400 foot levels, at a point where the rich shoot was expected to be found, judging from developments above.

IMPORTANT STRIKE.—Grass Valley *Tidings*, July 20: A strike that promises to add another dividend-paying mine to Grass Valley's credit has been made in the Central North Star property, owned by the Weissbein Bros., Capt. James Bennallack and San Francisco parties. At a depth of 230 feet, a ledge formation three feet in width has been cut, of which there are 14 inches of solid ribbon quartz, the remainder broken up and mixed, but giving every indication of uniting further on. The strike was made in a drift. The quartz shows free gold, carries a good quality of sulphurets, also galena and iron, and in every respect looks like a profitable milling proposition. The country rock is all that could be desired and is heavily mineralized. The Central North Star adjoins the celebrated North Star on the east, and the property is virgin ground. Many miners have not believed that this ground carried a payshoot, but Mr. Bennallack, who was superintendent of the North Star in the early days, and is now superintendent of the Central North Star, has always had a good opinion of it, an opinion now verified, for he has certainly discovered a pay-shoot, and, with his coowners, is a subject for congratulation. Incidentally, the North Star Company will no doubt benefit largely by the discovery, as the newly found pay-shoot undoubtedly exists in that company's ground also. Of course, no time will be lost now in demonstrating this.

Plumas.

A RICH MINE.—Oroville *Mercury*, July 20: The Thistle Shaft mine, situated on the divide between La Porte and Gibsonville, shipped about $10,000 after a two week's run. Underground they are not working a very large force, and the above fact is good evidence of the wonderful richness of the mine. They have a large territory to work, and have demonstrated that they possess one of the richest mines in the State.

San Bernardino.

IDEX.—San Bernardino *Gazette*, July 20: Knowing that Jack Anderson, Pete Klinefelter, George Frost, E. B. Stanton of Riverside and C. M. Marriner of Los Angeles, all owners of the celebrated Ibex mine, situated near the Needles, in this county, had returned from a tour of inspection of the mine yesterday, a reporter called on Mr. Anderson and gleaned the following: There have been 18 men at work on the mine since the present company purchased it on the 15th of December last, and during this time they have built a large boarding house, office and blacksmith shop, and have been steadily developing the mine. They have also built a good road from the mine to the Atlantic & Pacific railroad, which is three and a half miles distant. For the past 30 days they have been shipping their ore from all parts of the mine to the Victor mill, and it has averaged $41.80 per ton. This run was made as a test, and it is perfectly satisfactory to the owners. Mr. Anderson says that there is a mountain of good ore in sight. They left 12 men at work at the mine, who will thoroughly develop the property from now until next November, when the company intend to erect a 20, and probably a 60-stamp mill on the line of the railroad and about three miles from the mine.

Shasta.

NOTES.—Shasta *Courier*, July 20: The ten stamps on the Mammoth are running constantly on good ore. J. N. Vaunoy shipped his carload of iron ore from Stillwater last Friday. We hear that a large body of $50 ore was recently opened in the Calumet. More good lead prospects are reported from the Round Mountain country. Geo. McDaniels found a good prospect since he went up there. Dr. F. P. Mitchell and Mr. Wm. Andrews, of Whiskytown, left last week on a prospecting trip through the northeastern part of Trinity county. Last week Jack Strode sold his mine, situated near Whiskytown, to a company of Colorado men, who made the first payment on the mine last Friday. S. Weil, from Squaw creek, says the Riley & Bliss mine is opening out fine. Their ten-stamp mill is running on high-grade ore from a new body of ore he and Conroy found since they took hold of the mine. John Lowden, of the Golden Eagle Hotel, sent a sample of lead ore to the Stege Smelting Works recently, and it proved to be fine ore. It runs 37 per cent lead, carries 30 ounces of silver, and contains no antimony. It also contains 27 per cent of zinc. The discoverers say there is a six-foot vein where the sample was taken. It is located near Round Mountain, but the exact location is kept secret.

RICH STRIKE.—Redding *Free Press*, July 25: Vandeveer & Bullard, who for two years or more have been operating on Flat creek, and who have taken out considerable money, have struck it richer than ever. About 300 feet from the surface, in their tunnel 400 feet long, they blasted out this week a carload of the richest kind of quartz, filled with seams in which large quantities of gold were deposited. One lump of quartz as large as a man's head was a sight seldom seen, glittering gold all over it. The depth from which this rock was taken indicates a mine. The owners have been operating an arrastre, by which process they have lost considerable gold, and they are now considering the advisability of shipping the ore. The gold is very fine and full of air cells, causing much of it to float away on the water. S. Weil, of Squaw Creek, says the mine is looking first-class. From another source we learn that the present owners have been offered $60,000 for their bargain. We learn that Harrison, Lyons & Meeks have made a conditional sale of the Quartz Hill mine for $36,000, a payment of $3000 to be made in six weeks, the balance in stated payments of different amounts. The purchasers are San Francisco parties, who expect to be able to work the ore at a cost of 20 cents per ton. There is a whole mountain or blow-out of quartz, the poorest of which will assay from $4 to $6 per ton.

SOUTH FORK.—Cor. Anderson Valley *News*, July 25: The Crystal mine, on Andrews creek, is running full blast under the supervision of Robert Thistlewaite, of S. F. The company has put in a gasoline engine for hoisting purposes. The water has been raised from the shaft, and they will commence to sink deeper as they finish timbering, which will be in a day or two. The Martin boys have the Black Prince mine leased, and are running two shifts. They have a good prospect of taking out lots of good ore. W. D. Bull has commenced work on his mine. He has put in a horse power hoist for raising water and rock. His mine looks well. J. P. Wright is taking out good ore. He has several miners employed. W. O. Cooper and Henry Davidson are taking out good ore from the South Extension of the Dayton. They shipped some ore lately that gave very satisfactory returns. E. L. Ballou is taking out ore to ship. He sorts out the richer and will work the lower grade in his arrastre. The Shirland Bros. are hard at work on their mine, taking out some good ore. The reduction works are still at a standstill, and it looks at present as if it would not start for some time.

Tulare.

A MOUNTAIN OF COPPER.—Visalia *Times*, July 21: M. P. Lesher came down from the headwaters of the Kaweah, Monday. A *Times* reporter met him Tuesday evening and heard his story of the rich copper mine the gentleman says he has found some 62 miles east of Visalia, and 12 miles due north of Mineral King. Mr. Lesher located the mine last year, and has his claim properly recorded. He calls it the North Star copper mine. He has had several men helping him dig the tunnel this summer. The size of the vein of lead matter is 18 by 15 feet and the vein evidently extends through the whole of the large mountain in which it is located. Mr. Lesher, who claims to know something about copper mines, says that it is the richest mine of pure copper he ever saw. While digging on the tunnel this summer, he made a curious discovery. In chiseling on one of the walls of the tunnel, he thought for some time that the sounds that followed the blows seemed to indicate a hollow close at hand. Striking the drill a hard blow one time, it went through into an open space. When an opening large enough was made, it disclosed a large cave 30 by 15 feet and about 16 feet high. Mr. Lesher says the mine is on the headwaters of the Kaweah, and he has seen large snowbanks there in September. Near at hand are several lakes, and one of these has a great depth to it.

Siskiyou.

"STRUCK ILE."—*Telegram*, July 26: Clarence Prather, who has been for some time past engaged in sinking an artesian well at his farm near Montagne, can well be said to have "struck ile," as a superior quality of petroleum flows out with the water. It is supposed that at a lower depth, and by the use of special machinery, the oil and water can be separated. The new machinery has already been ordered, and will arrive in a short time, when the well will be sunk several hundred feet deeper than at present. It is one of the finest oil prospects that has yet been found on the coast, and Mr. Prather has received a flattering offer for its purchase from the Standard Oil Co., but he prefers to retain the property and work it himself. The well is now down about 500 feet.

Trinity.

NEW RIVER.—Cor. Trinity *Journal*, July 23: The mines are doing well. Leas & Nicholson have out a good lot of rich ore from the Sherwood mine; but as water has failed, so Miller's mill has been shut down. It is their intention when they get about 100 tons, to have it packed to the Ridgeway mill to be crushed. Ladd & Clements have been washing the dump on the Boomer mine, and in so doing have uncovered a good ledge. I learn that they took out yesterday two tons that will go $60 to the ton.

NEVADA.

Washoe District.

CON. CAL. AND VA. MINE.—Virginia *Chronicle*, July 23: 1500 level—From the south drift at point of connection with the old stopes we continue to extract some ore and fillings of average milling value. From the upraise which was carried up from the end of the crosscut run west 36 feet in from the main south drift, 155 feet south from the shaft station, we have continued to work upward and to extract ore of fair quality. 1600 level—We have continued prospecting upward from the old sill floor of the old stopes, from which some ore of fair quality is being extracted. 1650 level—Continued to extract some ore from the drift run east from the winze No. 3 (down 73 feet) in working upward from that point. Also some ore from the old stopes at the north end of the California ground. In working upward from the drift run north from the bottom of the winze sunk 28 feet in this last locality through the old timbers, have continued to extract a few tons of milling ore. There have been extracted from all parts of the mine during the week 1001 1100-2000 tons of ore which was shipped to the Morgan mill, the average value of which, per car samples, was $29.30 per ton. The average assay value of all the ore worked at that mill during the week, 980 tons, was $25.22 per ton, per battery samples. Bullion shipped to Carson Mint, assay value $14,343.53. Bullion on hand in our assay office, assay value about $15,200.

OPHIR.—1465 level—From the south drift, 101 feet below the sill floor of the 1465 level, at a point 84 feet in from its mouth, the west crosscut has been advanced 20 feet; total length 46 feet, continuing in quartz formation which carries assay values varying from $6 to $12 per ton.

MEXICAN.—On the 1465 level the drift running north from the crosscut run east from the bottom of the winze sunk 101 feet below the sill floor of this level near the south boundary of the mine, at a point 40 feet east from the winze, has been advanced 18 feet; total length 171 feet; in porphyry and clay.

UNION CON.—900 level—The joint Union Con. and Sierra Nevada west drift has been extended during the week 27 feet; total length west from the joint shaft 2227 feet; the face is in porphyry and small streaks of quartz of low assay value.

UTAH.—340 level—From the end of the north drift (at a point 432 feet in) from the west crosscut from the shaft station, a west crosscut has been started and advanced 45 feet in a porphyry and clay formation.

SIERRA NEVADA.—The east crosscut No. 1 from the north drift, 100 feet in, Kenosha tunnel, has been advenced 33 feet, making its total distance 175 feet; face in soft porphyry. The joint Sierra Nevada and Union west drift, 900 level, was extended 27 feet, making a total distance west of shaft of 2227 feet; face in porphyry and small seams of quartz yielding low assays.

ANNES.—North drift from east crosscut No. 4, 420 level, was advanced 6 feet and the work in the face stopped for the present; total length of the drift 456 feet. From the end of this drift an east crosscut has been advanced 10 feet; formation quartz and clay.

GOULD & CURRY.—200 level—Northwest drift, started 435 feet west of shaft, has been extended 12 feet through hard porphyry; total length 424 feet. Also did some repairing on the 400 level during the past week. On the Sutro tunnel level we have resumed work in the joint north drift with the Savage Company, and have cleaned and repaired the same a distance of 50 feet. We are timbering the last 15 feet of the joint upraise where it connects with the joint winze from the Savage 1500 level.

BEST & BELCHER.—900 level—Have done some repairing to west crosscut No. 1 and advanced same a distance of 9 feet through hard porphyry; total length 395 feet. Also did considerable repairing to the north drift, 1000 level.

HALE & NORCROSS.—Have been retimbering the three compartments of the main shaft between the 400 and 500 levels. Main incline—Are making some necessary repairs to main incline, and are now putting in new guides between the 1700 and 1800 levels. 1800 level—During the week have completed the working station and chute on this level, and started a north drift and a south drift from the station.

CHOLLAR.—Are repairing north drifts on the 650 and 750 levels. The east crosscut near the north line, 900 level, is in 78 feet; face in soft porphyry.

POTOSI—Are running a drift from upraise, 1100 level, at a point 48 feet below 1100 level to connect with the Potosi winze. The north drift from bottom of south winze, 1200 level, is out 55 feet; face shows 4 feet of fair-grade quartz. Have connected the upraise from the 1300 level with north winze from 1200 level. Are timbering ground at connection. The joint northwest drift from the 1800 station, Ward shaft, has a total length of 637 feet; face in hard porphyry. Extracted and sent to the mill in the past week 509 300-2000 tons of ore from the 930, 1000, 1100, 1150 and 1200 levels. Milled during the week 509 tons. On hand at mill 107, 1600-2000 tons; average battery assay $25.08; average car sample assays $29.77. Shipped to Carson Mint 365 pounds of crude bullion.

BULLION.—The east crosscut, 560 feet south of north line, 1500 level, is out 60 feet; face in hard porphyry. The joint northwest drift from the 1800 station, Ward shaft, is advanced a total length of 638 feet; face in hard porphyry.

ALPHA.—The joint Exchequer and Alpha south drift from north line of Exchequer, 1800 level of Ward shaft, has a total length of 287 feet; face in clay and porphyry.

EXCHEQUER.—The joint Exchequer and Alpha south drift from north line of the Exchequer, 1800 level of Ward shaft, has a total length of 257 feet; face in clay and porphyry.

WARD COMBINATION SHAFT.—The joint Alpha and Exchequer south line drift from the north line of Exchequer, 1800 level of Ward shaft, has a total length of 287 feet; face in clay and porphyry. The joint Bullion and Potosi northwest drift, from the 1800 level, has a total length of 630 feet; face in hard porphyry.

CON. NEW YORK.—The winze in No. 4 west crosscut, 650 level, is down on the slope 4 feet; the bottom shows half a foot of fair-grade ore. The west crosscut, 850 level, is in 43 feet; face in low-grade quartz.

Ely District.

THE CYANIDE PROCESS AT WOAK.—White Pine *News*, July 20: The Ely Mill and Mining Co. have just completed a cyanide works at their mill here. They have put in four tanks of 30-ton capacity each. A tramway with a car attached is rigged up with water power to carry the tailings from the dumps to the tanks. High up above these tanks is the cyanide tank, which is connected with the other tanks by a pipe. This is so arranged that it can be used on the battery pulp when working ore as well as on tailings. The plant is a very simple piece of mechanism, and if it proves equal on a large scale to what it has done on small tests, the Ely M. & M. Co. have a good thing on their tailing pile alone. They have constructed a neat and substantial structure over the plant, and a week or so will satisfactorily determine whether the process is all that is claimed for it. To James McOmie, a member of the company, the *News* man is indebted for the courtesy of showing him through the works and explaining its mode of operation.

Tuscarora District.

NAVAJO.—*Times-Review*, July 23: The slopes above the 350-foot level continue about the same as last report.

BELLE ISLE.—North drift, 250-foot level, extended 7 feet. South drift, same level, extended to a fault. An upraise has been started on the ore in the drift. West intermediate crosscut above the 350-foot level extended 11 feet, cutting seams of low-grade ore.

NORTH BELLE ISLE.—No. 2 upraise, south of 500-foot level, extended 12 feet, showing a little ore coming in the top. An intermediate crosscut from this raise has been extended eight feet into the footwall. The stopes are yielding better.

COMMONWEALTH.—Second level: South drift from No. 5 chute advanced 13 feet. Have 40 feet more to connect with west drift of Nevada Queen. Have started raise on third level, 60 feet north of the line.

NEVADA QUEEN.—There have been worked at the Union mill 72.2 tons of first-class, pulp assay $262 per ton, and 598 cars second-class ore sent to concentrating plant—266.7 tons were concentrated; assay from battery, $24.62 per ton. Received from Union Mill Company $35,000 on account of sale of ore and concentrates.

ARIZONA.

WHITE HILLS.—*Examiner*, July 25: Mr. Schaefer, the discoverer of this new Arizona camp, in an interview, says: "The first location I reserved for myself, and my partner, Jno. P. Bernett, and some members of my family are coowners in the principal mines. There have been many other locations made since, and some of them are turning out well. The Schaefer Treasure is the first location made by me, and on the top of the ridge, four distinct veins—the Othello, Grand Army, Desdemona and another—are included in one location. South of these lie the Garfield, African, Occident, Horn Silver, Orient and the Norma. On the north are the Mayflower, Huldah and the Chief of the Hills. The latter, the easterly half of the location, 750x600 feet, I have just sold to parties from Virginia City, Nev., for $18,000. In speaking of the ores, which are free-milling chloride, the assays run high. I sent a piece of the first rock taken from the Norma, about 20 feet from the surface, to the *Examiner*. Some of the dirt which fell off of it was assayed at the Kingman Sampling Works, and it ran $744.20 in silver. The piece itself is here to be tested, and it will go in the neighborhood of $1324 in silver to the ton. The only assays which I will refer to just now have been made in this city at the instance of local experts. They will be safer to quote than any coming directly from myself. They run as follows, according to the certificates sent to me since my arrival: Grand Army—Gold, $41.34; silver, $118.94; total, $160.28. Garfield—Gold, $24.70; silver, $320.37; average of vein, $345.07. Norma—Gold, $6.20; silver, $2500.10; average of vein, $2506.20. Horn Silver—Lowest assay, $59.07 in silver; $6 20 in gold; average, $65.27. The lowest average so far obtained at the Kingman Sampling Works was 333 ounces in silver and 1¾ ounces in gold. We have sunk on several of the claims to a depth of from 10 to 30 feet, and find the veins holding out well with depth. Of course this is the main point, and development alone will prove the continuity of the deposit. There is no timber at the mines, but a plentiful supply of soft wood, cedar and pine, can be obtained within 18 miles. Water is scarce at the camp, of course, but we have got some at a depth of two feet, and expect to get a good supply from a well now down a distance of nine feet. On the dividing range, between Hualapai and Sacramento valleys, there are some good springs, and the elevation of 800 feet above the mines will give a good fall at the camp. On the east side of this range there are six or seven wells already sunk. A Los Angeles company is now figuring on boring a well right below my house at the camp."

MONTANA.

GOLD.—Phillipsburg *Mail*, July 23: If the reports of gold discoveries made in the section of country surrounding Phillipsburg, during the past week or so, prove to be half as good as many claim them to be, and their owners show up ledges to any reasonable extent, the greatest silver-producing district in the United States will soon earn the reputation of being a wonderful gold producer. Four rich gold discoveries have been reported to the *Mail* during the past few days—all in different sections of the country surrounding Phillipsburg—and in two of the cases we have seen specimens of the ore, one of which, in particular, would do the heart of a Wall-street goldbug good. The continual depression in the price of silver has greatly stimulated the sturdy prospector in his determination to find a gold mine, and that we have them right at our doors and adjacent to Montana's greatest silver-producing sections, is proven be-

yond dispute. The *Mail* believes that Phillipsburg will, in a short time, become the business center of hy far the greatest and most active gold as well as silver, mining section in the world. Go east, west, north, south, or at any intermediate point of the compass, and you will find rich prospects—hoth gold and silver. There appears to he one vast chain of a mineral helt snrronnding us, which in time, as a few of the discoveries are developed, will open its riches to the world. Of course, all these recent discoveries do not prove the existence of paying mines, but they do show, conclusively, that the precious metal is here and only awaits the hand of industry and capital to develop it, and gives encouragement to those who have spent years in their search for the glittering treasure to continne the hunt.

MARKET REPORTS.

Local Markets.

SAN FRANCISCO, July 28, 1892.

General trade continues about the same as reported last week. While isolated complaints are heard from iron workers, as a rule they are fairly well content with present business, notwithstanding the very small margin, owing to strong competitiou, of profit on contract work. With such large money reserves in the banks in this State, large railroad building and other important improvements under way, it looks very much as if we are on the eve of more prosperous times, particularly if we take into consideration the signs of a coming speculation in farm produce and farming land. The first speculative movement commenced in the products of the orchard, and with large profits in fruit, naturally, land adapted to fruit culture is appreciating in value. All information received from the East indicates that the long period of inaction that has prevailed there has been broken. Railroad and other leading American securities are in good demand at improving prices in the speculative centers. This increased activity is supplemented hy a steadily increasing call for funds, which is creating a firmer tone with capitalists and hankers in their demands for full interest on all money placed on approved security. The improved feeling at the East has strong support in the Government's statement of the foreign commerce of the country for the fiscal year ending with June 30th, and also to a turning of European investors to this country for profitable ventures. The Government returns for the fiscal year show that the total value of our imports and exports of merchandise attained its highest point, amounting to $1,857,726,910, as against $1,729,397,006 during the fiscal year 1891—an increase of $128,329,904, and an increase of $370,193,833 over 1889. The excess in value of exports over imports of merchandise during the last fiscal year was $202,944,342. The value of our imports of merchandise during the last fiscal year amounted to $827,391,284, as against $844,916,196 during the fiscal year 1891—a decrease of $17,524,912. The average annual value of our imports for the ten years, from 1882 to 1891 inclusive, has been $712,411,678. The imports during June were $72,004,743, against imports in June, 1891, of $73,462,225. The exports for June were $64,944,813 for 1892, against $57,594,734 for 1891. The value of our exports of merchandise during the fiscal year 1892 was $1,030,335,626, as against $884,480,810 during the fiscal year 1891—an increase of $145,854,816. The value of our exports of domestic merchandise was in 1892 $1,015,789,607, and it was the first year of our commerce when our domestic exports of merchandise attained to a billion of dollars. The figures of our gold shipmente show a very small excess of exports, while silver exports were considerable. The figures for the year ending June 30th are as follows: Exports of gold, $50,195,327; imports of gold, $19,698,342; excess of exports, $496,985; exports of silver, $32,810,559; imports of silver, $19,955,086; excess oi exports, $12,855,473; excess of exports of gold and silver combined, $13,352,458. The immigration for the year ending June 30th was 619,320, the largest of any year since 1882.

The lower freight rates hy sail hetween San Francisco and the Atlantic seaports are proving of great benefit to the general trade of this city. The low rates hy sail have, it is said, induced the railroad company to make hetter terms with shippers, hoth of which are proving of advantage to the wholesale trade.

SILVER—The market has fluctuated to some extent, hut the general tone appears to he fairly strong, considering the dullness nf trade reported hy all civilized countries. The general trade of the world, if the most reliable commercial and financial writers in all commercial countries can he accepted as authority, is shaping itself into a hetter situation lor more active times, and when trade and speculation are active there is a strong call for money, in which silver sympathizes and commands hetter prices. Aside from this, the International Bimetallic Conference promises good results, and may, in the end, he largely instrumental in raising the money standard of the white metal. The output of the mines in this country does not show any material decrease, neither does active prospecting work in the various mining districts, so far as reliahle public advices show, warrant the relief that there have been discoveries of silver-hearing ore worthy of special attention.

MEXICAN DOLLARS—There was shipped the past week $400,000 to China. The market is weak at around 68¾ cts.

QUICKSILVER—Receipts the past week aggregate 317 flasks, and exports hy sea, 200 flasks to Australasia and 30 flasks to Mexico. While the Eastern market steadily declines, our market is quoted at unchanged prices, notwithstanding sales at lower prices are reported to have heen made.

LIME—Receipts the past week aggregate 2660 barrels. The demand is still slow.

ANTIMONY—The market is harely steady. New York mail advices report a dull and easier market.

BORAX—Receipts the past week aggregate 900 centals. The market is essentially unchanged.

PIG IRON—The local market is reported ahout the same as has ruled for the past two weeks. Eastern mail advices report a heavy market for pig, but an active and higher market for structural material, hars and steels.

TIN—The market is quite dull for hoth pig and plates, with huyers still favorahle with cnncessions on asking prices. Both Eastern and foreign advices are essentially unchanged.

PIG LEAD—Tne market is weak. Eastern advices report more selling pressure, which causes a weak and somewhat irregular market.

COPPER—The market shows a little more strength, due to a hetter concentration owing to outside holders at the East selling out. London advices to July 20 report as follows: "Some firmness developed on rumors of purchases for the account of American operators, hut that was offset suhsequently hy the unfavnrahle statistical exhibit fnr the last fortnight, showing increase in stocks of 2270 tons. Chili charters were 1200 tons. Demand for consumption is at present rather quiet. Sales nf furnace material during the first half of the month included 1600 tons Anaconda malte, argentiferous, forward delivery, terms not transpired. Visible supply of copper in Europe increased 2083 tons during the fortnight."

COAL—Tacoma, 9420 tons; Newcastle, N. S. W., 3158; Nanaimo, 4524; Departure Bay, 5816; Coos Bay, 800; Seattle, 979. Total, 23,697 tons. The market is still reported well supplied. The consumption demand, although reported fairly active, is said not to he up to what had heen expected. For distant cargoes on passage and for cargoes for shipment there is a strong tone with a slight advance reported asked.

Mining Share Market.

SAN FRANCISCO, July 28, 1892.

Mining shares hung around at ahout hlackhoard prices up to yesterday, when a sharp decline set in greatly, to the relief of the hetter-informed operators who had almost despaired of the pnints put out for low prices heing touched for some time to come. Now that the low figures have been very nearly reached in the down move they look for much hetter times in the near future. There are others, again, equally well-informed, who are very confident that another line of assessment will he levied, and perhaps, collected, hefore the hig deal sets in. The writer does not pretend to know how the share market is to he manipulated, hut accepting previous deals as a fair guide, it is a safe proposition, to huy such shares as Yellow Jacket, Overman, Belcher, Crown Point, Kentuck [the latter mine lies hetween Yellow Jacket and Crown Point], Challenge, Potosi, Chollar, Sierra Nevada, Alpha and Occidental, with the market prices as low as they now are, for experience has taught that it is only a question of time when purchaser of low-priced shares, will, even if he pays one or two assessments, make hig money. The present drop in the market was arranged hy a master-hand and carried out in a most systematic manner. Strange as it may appear, it is said that a large number of operators sold their shares, some of whom even sold short, when they knew that D. O. Mills was on the coast.

They firmly helieve that Mr. Mills is opposed to any and all deals, for milling the ore extracted is good enough for him. Low water in the Carson river afforded a rare excuse for hreaking the share market. It will also give the rings an excuse to levy another line of assessments. Insiders are after certain shares, and their course indicates a firm determination of getting them before showing up any of the rich ore they have been developing to the west. It remains to he seen whether they will succeed in getting them at the outrageously low prices now current for the more important.

How times do change. Before the 1886 deal it was the managers of the North End mines who did the rohhing, etc., and outsiders were told to let the shares in that end alone. In consequence the shares of Con. Virginia, Best & Belcher and Ophir were concentrated and a hig deal was made in them. Now it is the managers of the Middle mines, and also the managers of the Gold Hill mines that are the rohhers, etc., and those who control Con. Virginia, Ophir and Best & Belcher are little angels, who would not take even a hot stove if given a chance. What will he the outcome time alone will tell.

A Nevada City paper says that Judge Hehhard is at that place examining the mills and mines. This is the only correct course to pursue for the application of the defendants in the Hale & Norcross suit, for a new trial will come up hefore him on next Monday, and by personally seeing how the mines are worked and the ore milled elsewhere, he can hetter judge how to rule. Judge Hehhard, evidently, helieves in personal knowledge. This is contrary to the general impression of how California Judges form their opinions, for it is the common helief that the ring of metallic currency controls in forming the opinion or a large majority.

For over four years the MINING AND SCIENTIFIC PRESS has contended for honest mine management on the Comstock. This has been down in the interest of the mining industry and also for the henefit of those outside shareholders who have heen persistently victimized. In its contention it was claimed that car sample assays were taken of all ore extracted and raised, and that they were kept from the public contrary to the mining laws of this State. Our assertions were strenuously denied, hut they were proven correct in the Hale & Norcross suit, and if anything was wanting it would as the following taken from a contemporary's review of the decision in the Hale & Norcross suit [the article in question has every evidence of heing inspired by the inside]: "When ore is hoisted from a Comstock mine, two samples are always taken for car assays. One of these is taken immediately after the car reaches the top, and is placed in what is known as the surface hox. The second is taken when the car arrives at the ore house, heing finally assayed for the different returns." The article in question further says that this system was "universally adopted at all mines as a check on ore values." If the car sample assays are good for insiders they certainly are good for outsiders, and under the laws the latter are entitled to the information. In this connection it is in place to recall the following frnm the puhlished statement in the PRESS of the testimony given in the Hale & Norcross suit: "D. B. Lyman, superintendent of the Con. Virginia Mining Co., testified that there was a difference of 10 to 12 per cent hetween car sample and battery assays—car samples heing the higher, and that mills should return not less than 65 per cent of the car sample assay. When asked hy Judge Hehhard what ore assaying $100 at the mine, hy car sample, ought to assay at the mill, he said, $90, and $15-ore hy car sample, at the mine, ought to assay $12.50 at the mill; that the Con. Va. mills were returning 74 to 75 per cent of the mine assay value. Jnhn W. Mackay testified that in early days they used to sell their ore to the mills, the mills paying 65 per cent nf the car sample or wagon assay value. Since that time there has heen a vast improvement in milling ores, and according to Mr. Mackay's estimate of selling the ore at 65 per cent of its assay value, Judge Hehhard's judgment against the ring for one million dollars is too small hy many thousands of dollars, instead of heing an outrage, as they would try to make the puhlic helieve in their latest attempt at mutilating facts.

Eastern Metal Markets.

NEW YORK, July 27.—The following are the closing prices the past week:

	Silver in London.	Silver in New York.	Copper.	Lead.	Tin.
Thursday	39⅜	86	11 50	4 05	20 65
Friday	39½	86¼	11 55	4 05	21 60
Saturday	39⅜	86½	11 65	4 05	21 00
Monday	39⅜	86¼	11 65	4 05	20 45
Tuesday	39 1-16	85⅞	11 65	4 05	21 45
Wednesday	39⅛	85½	11 65	4 05	21 40

Quicksilver is weak at lower prices. Borax is fairly steady. Pig tin has sold at still lower figures. Copper, while strong, is reported slow. Pig iron is still in buyers' favor.

NARROW BELTS.—F. H. Colvin, in the *American Machinist*, says: "Why will men (the shop managers in this case) never learn that a narrow belt is an abomination in general cases? Here is an emery wheel that does hard work, and we find a little two-inch helt attempting to drive it; the result is that the speed slacks down as soon as a heavy piece of work is put on it, and it needs relacing very often. Generally speaking, the helts can hardly he too wide, within reason of course, and the wide helt will he found to give the best results every time. The ideas of economy that we see displayed in so many cases in connection with helts give one a poor impression of the ability of many shop managers; it must he from lack of thought on the subject. The cost of a new helt, when needed, is far less than the time of the attendant when engaged in patching the old one.

The Benjamin Electrical Pickling Process.

Mr. George H. Benjamin, of New York, has invented and recently patented a process of pickling black plates hy electricity. In the usual method, the plates which are to he tinned are immersed in a weak solution of sulphuric acid and afterward rubhed hy hand to remove dirt, grease and rust. In Mr. Benjamin's apparatus a tank contains the cleaning liquid, a solution of sulphate of soda or sulphuric acid, for example, and has a positive electrode, preferably an iron plate, and a crate carrying the plates to be cleaned, which forms the negative electrode. When a dynamo is connected with these electrodes, an electrolytic action takes place, oxygen being set free at the positive electrode and hydrogen at the negative. This hydrogen set free from the surface of the plates serves to reduce the oxides on the surface, and also to decompose any grease that may he present, as well as incidentally to cause any accumulation of dust or dirt that may he upon the plates to drop off. Ordinarily it is sufficient to charge the plates in a solution of sulphuric acid and water, continuing the current from fifteen minutes to three-quarters of an hour. Where the plates are very much covered with grease, they may he immersed first in a solution of sulphate of soda, chloride of sodium, or any other solution of a neutral salt and charged for about fifteen minutes, and subsequently introduced into a solution of sulphuric acid in water and charged as above described. Where the plates are very dirty—that is, are covered with a great deal of rust—it may he necessary to continue the current while they are immersed in the sulphuric acid hath for a longer period. After charging, the plates are removed from the hath, rinsed with fresh water, and then dried hy rapid heating, after which they are ready for the tinning hath.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR WEEK ENDING JULY 19, 1892.

479 238.—AIR SUPPLY FOR GAS MACHINES—E. B. Badlam, S F.

479,051.—STEP LADDER—L. E. & A. E Bowser, S. F.

479 390.—ELEVATOR—M. Y. Calcutt, Seatile, Wash.

479,055.—LID LIFTER FOR KETTLES, ETC.—A. E. Cobb, Phœnix, A. T.

479,117.—NEEDLE EXHIAITNG CASE—E. R. Denny, Spokane, Wash.

479,253.—AIR DUMP CAR—C. H. Dow, Tacoma, Wash.

479,258.—RAILWAY SIGNAL—S. Emrich, Reno Nev.

479,104.—LOCK—Fleischal & Bertrand, S. F.

479,280.—COPYING DEVICE—J. C. Ingram, S. F.

479 281.—CULTIVATOR—Johnson & Olson, San Jose, Cal.

479,286. — BLACKSMITH'S FOAGE — Lenzen & Heckenroth, San Jose, Cal.

479,238.—BOILER—J. R. Lutgen, Castle Rock, Wash.

479,094.—AORICULTARAL IMPLEMENT—M Macleod, Los Angeles, Cal.

479,146.—AMALGAMATOR, ETC.—L. C. Moreland, Ogilhv, Cal.

479,011.—CAN OPENER—C. Morgan, L tah, Wash

479,296.—ROPE-GUIOING SHEAVE—Sam'l Murray, S. F.

479,308.—ALARM SIGNAL APPARATUS — Paul Seiler, S. F.

479,081.—SUSPENSION BAIDGE—G. A. Stephenson, Los Angeles, Cal.

479,099.—CAN STAND—E. Thomas, Los Angeles, Col.

479,235.—WATER GAUGE—W. A. Woods, S. F.

The following brief list by telegraph, for July 26, will appear more complete on receipt of mail advices:

California—Charles F. Baxter, Marietla, shipper's folding crate or coop; Archibald Ford, Golden Gate, apparatus for reducing bituminous rock; Byron Jackson, San Francisco, pneumatic feeding apparatus for straw; Joseph F. Klog, Mont Alvo, bean harvester; Andrew K. Longnecker, Elk Grove, fruit packer; Ernest McCullough, San Francisco, spirit level; Nathan W. Moody, Fresno, miner's tool; Robert F. Nichols Sr., Altnras, motor.

Washington—Grosveoor S. Andrus, Walla Walla, weed cutter; Nathan Cosman, Seattle, kettle cover; Rloaldo S. Robertson, Artondale, adding machine.

Arizooa—Charles W. Miller, Clifton, label holder.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co in the shortest time possible (by mail for telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

CULTIVATOR.—Charles Johnson and Otto Olson, San Jose. No. 479,281. Dated July 19, 1892. The main object of this invention is to provide a cultivator the frame of which is so constructed that it is adapted to be readily converted from a two-horse cultivator into a single or one-horse cultivator, and vice versa.

BLACKSMITH'S FOAGE.—T. W. Lenzen and L. Heckenroth, San Jose. No. 479,286. Dated July 19, 1892. The objects of this invention are to provide means for introducing the air to the fire in a heated condition, whereby more perfect combustion is had; to introduce it in such a manner as to concentrate it on the working basis or seat of the fire; to provide for an easy discharge or removal of the slack without disturbing the fire, and to provide for a perfect regulation of the current of air and a convenient discharge of the cinders, these several objects being attained, respectively, by the arrangement of the air-passages, the shape of the fire-receptacle, and the provision of the bottom-lock.

AIR-SUPPLYING DEVICE FOR GAS MACHINES. Edgar B. Badlam, S. F. No. 479,238. Dated July 19, 1892. This machine for proportioning mixtures of air and hydrocarbon vapor is employed in conjunction with machines in which inflammable vapor or gas is produced by passing air through a volatile hydrocarbon, this vapor when mixed with a proper quantity of atmospheric air being suitable for illnminating purposes. The object of the invention is to provide an apparatus hy which a variable amount of air may be accurately supplied to the carburetor and another volume simultaneously mixed with the vapor after it has been produced in the primary portion of the apparatus.

COPYING DEVICE.—Joseph C. Ingram, S. F. No. 479,280. Dated July 19, 1892. The device is intended for copying letters and either written or printed matter. It consists of a roller adapted to receive the impression from the written sheet and transfer it to the copying-sheet, a hox with slotted sides, within which said roller is contained, a cleansing device situated in the hottom of the hox, and a means for rotating the roller in contact therewith. When a page has been prepared for copying, it is onlv necessary to place the roller in contact with one end of the sheet and rotate it over the page, when the characters inscribed thereon will be transferred to the surface of the roller. From this roller the characters are readily transferred to any desired numher of sheets where the characters are to he reproduced.

ROPE GOIDING SHEAVE — Samnel Murray, S. F., assignor of one-half to Wm. F. Murray. No. 479,296. Dated July 19 1892. This is a guiding-sheave for ropes, the object of which is to enable the operator to provide for any change of direction of rope through which power is to be transmitted. The h se-plate corrying the roller or sheave is adapted to he fixed or secured in any suitable position, either upon the deck of a vessel, upon the hits of the windlass, or in any place where it can he conveniently employed. By means of peculiar disks and flanges, the combinations are arranged which enable the operator to lead a rope in any desired direction, ood always approaching the sheave and leaving it so as to move in the plane of rotation of the sheave and lead fairly.

ELECTRIC FOG SIGNALING.—"So far as appears from the present outlook, future telegraphic progress promises no great resnlutinns. Method and means will, no douht, become more and more refined, and greater speed be attained," says Prof. Elibu Thomson in the July *New England Magazine* The more general introduction of multiplex systems will increase the capacity of the lines and decrease the costs, and more attention will be given to permanence nf lines and to securing immunity from extended interruptions due to storms. It may be remarked here, however, that electricians are not without some hope that signaling or telegraphing for moderate distances withou wires, and even tbrough dense fog may he an accomplisbed fact soon. Had we the means of obtaining electric oscillations of several millions per second, or waves similar to light waves, but of vastly lower rate of vibration, it migbt be pnssible hy suitable reflectors to cause them to he carried a mile or so through a fog, and to recognize their presence by instruments constructed for the purpose. Many of the difficulties and dangers wbicb now beset the navigator would at least, he lessened, if not removed Signaling or telegraphing without wires is no new proposal, and there bave been many such proposals whicb are extravagant and impracticable. The fact is, bowever, the essential means are not yet forthcoming.

Complimentary Samples.

Persons receiving this paper marked, are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal and making its value more widely koown to others, and extending its influence in the cause it faithfully serves. Subscription rate, $3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber please show the paper to others.

WANTED.

The owner of a group of Nine Gold Veins, two of which average $30 per ton gold, wishes to give a working bond on very reasonable terms, to party who will develop the property. Wood and water convenient and abundant. Only basee in ores are iron and sulphur.

Address Box 1. PONY, Montana.

WANTED.

Position as Superintendent or Metallurgist.

First class Mining Engineer and Metallurgist, several year's experience in Europe, America and Mexico, is open for engagement. Graduate of one of the best mining schools in Europe. Best references. Address,

Secretary Concordia Club, San Francisco, Cal.

WANTED—A POSITION BY A MINING ENGINEER and Metallurgist. Lead and Copper Smelting. Address Box W., this office.

Assessment Notices.

NOTICE OF ASSESSMENT.

CALIFORNIA VERDE ANTIQUE MARBLE COMPANY Location of principal place of business, San Francisco, California; location of works, Placer County, California.

Notice is hereby given that at a meeting of the Board of Directors, held on the 12th day of July, 1892, an assessment (No. 2) of One Cent per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the Company, 3 8 Pine street, San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the 22d day of August, 1892, will be delinquent and advertised for sale at public auction, and unless payment is made before, will be sold on MONDAY, the 12th day of September, 1892, to pay the delinquent assessment together with costs of advertising and expenses of sale.

By order of the Board of Directors.

W. J. GURNETT, Secretary

Office, 3 8 Pine Street, San Francisco, California.

DELINQUENT SALE NOTICE.

THE BUTTE KING MINING COMPANY. LOCATION of principal place of business, San Francisco, California. Location of Works, Butte County, California.

Notice—There are delinquent upon the following described stock, on account of Assessment (No. 4) levied on the 4th day of June, 1892, the several amounts set opposite the names of the respective shareholders, as follows:

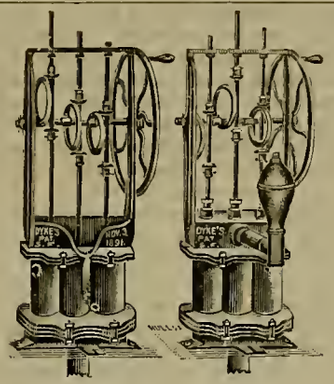
A Triplex Pump.

This pump, recently patented by Hugh J. Dykes of Peralta, Alameda Co., and manufactured by Stewart & Trowbridge of Berkeley, is one of that class in which are embodied a number or series of separated cylinders, with a common inlet and common discharge and each having pistons which are operated successively to produce a continuous stream. The object of the inventor is to provide a simple pump of this class in which the total capacity is so divided as to materially reduce the power necessary to operate the members separately, and yet effect as a sum of the operation of all, a result equal to the sum of their capacities. By the peculiar construction, Mr. Dykes claims that the distribution of the labor or power required to operate the pump is equal in all parts of the circle. It is specially adapted for deep well irrigation or ship use. It may be run by hand, or any power may be applied. For windmill work it avoids uneven and irregular motion. The cuts readily show the application and construction, the cams and pistons being shown in two positions.



THE DYKES TRIPLEX PUMP.

The Metric Model.

The accompanying cut is from a photograph of an apparatus invented and just patented through the MINING AND SCIENTIFIC PRESS Patent Agency by James Mc Court of Salem, Oregon. It is intended to illustrate and explain the decimal system, and particularly the metric system of weights and measures. It will be a valuable school room help, as it shows objectively all that is claimed for it. It can be used to illustrate coinage, numeration, etc., to beginners, and proportion, progression, logarithms, etc., to the advanced pupils. As an expounder of the metric system, which is now used so extensively among the civilized nations of the world, it is useful as showing all the standards at full size. The apparatus consists of two blocks substantially as shown above; the small one is the cubic diameter and the large one the cubic meter.

In its application to numeration and coinage, *A* shows (10) units or cents (10 mills); *A*, *B*, tens or dimes; *A*, *B*, *C*, hundreds or dollars; *A*, *B*, *C*, *D*, thousands or eagles (closed block).

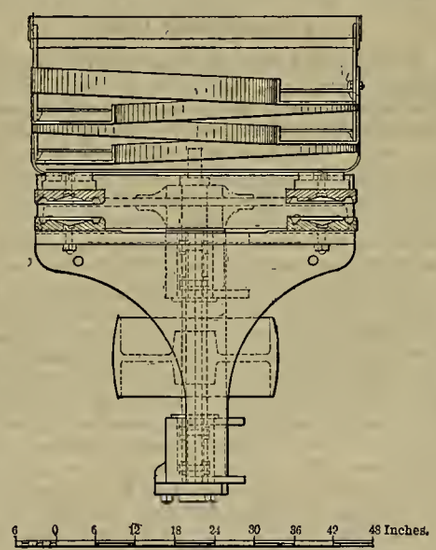
The following shows its application to the metric system, so far as weight and liquid and dry measures are concerned, and sufficient to show its working:

Weight (small block cu. dm.)—*A* shows the gram, full size; *A*, *B*, the dekagram, full size; *A*, *B*, *C*, the hectogram, full size; *A*, *B*, *C*, *D*, the kilogram, full size.

In liquid and dry measure (large block cu. m.), *A* shows the liter, full size; *A*, *B*, the dekaliter, full size; *A*, *B*, *C*, the hectoliter, full size; *A B*, *C*, *D*, the kiloliter, full size.

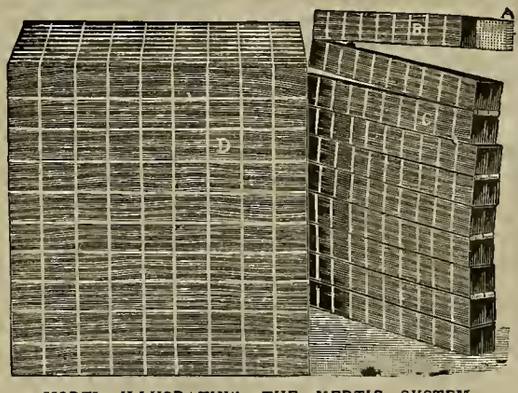
Gyrating Screen for Sizing Mineral.

In the gyrating screen shown on this page, intended for cleaning and sizing coal at a mine, is an approximately horizontal screen which is given a gyratory motion like that the moulder gives to his sieve when screening his sand. Its great advantage is that the whole surface of the screen is constantly in action, while on a revolving screen only one part is at any one time in action. The problem of constructing a gyrating screen when it is to be large, and must make a great number of sizes, is to support it in such a manner that it will gyrate easily and safely and, at the same time, that it will be self-contained, so that the centrifugal force will be counterbalanced and will not shake the building. This has been done successfully. The method consists essentially in supporting one horizontal plane above another by means of three or more double cones, while the motion of gyration is given to the upper plate by a crank upon a shaft passing through and journalled on the lower plate. The cones roll freely in a prescribed path on the lower plate. There are several forms of these screens, the cut showing the single one. The upper plate is the screen-box. On the shaft shown



SINGLE GYRATING SCREEN FOR COAL.

in the bed-plate a pulley is placed to drive the screen. The large wheel shown between the screen-box and the bed-plate is counter-weighted to balance the centrifugal



MODEL ILLUSRATING THE MERTIC SYSTEM.

force of the screen-box. Above this wheel is a crank to drive the screen-box. The box is 4 feet wide and 6 feet long, inside measurement, giving 24 square feet of screen surface per shelf. The number of shelves in this type varies from two to six, depending upon the size of material to be screened. The smaller the size of coal, the closer to each other the shelves can be put.

The Geological Survey.

In the interest over national politics and partisan measures, the Congress now in session seems to pass over with easy indifference a number of measures which mean a great deal for the general welfare of the country. One of the most short-sighted policies inaugurated is the war made upon the U. S. Geological Survey by reducing the appropriation for this work. If we understand the bill correctly, the paleontological and the chemical departments are cut out almost entirely, and the general geological force so reduced as to effectually stop field geological work for the present session at least. The topographic division is not so seriously affected, although the number of geographers is materially reduced.

The Geological Survey was organized in 1879 by consolidation of the Geological Survey of the Territories, called the "Hayden Survey;" the Geographical Surveys west of the 100th meridian, called the "Wheeler Survey;" and the Geological and Geographical Survey of the Rocky mountain region, called the "Powell Survey." This was done in accordance with the recommendation of the National Academy of Sciences, to meet the general opinion of scientific men in the United States, and to avoid any possible duplication of work. For a little over a year Clarence King was the director, and then almost by acclamation Major John W. Powell was appointed at the head of the Bureau. Under Powell's able leadership, the survey was established upon a business and workman-like basis, and the result of his work and management has called forth most splendid recognition from Paris, from Vienna, from Heidelburg and from St. Petersburg.

In our own country the encomiums are not so enthusiastic or so general. For, alas our legislators create only to destroy, and cripple scientific research at the very moment when it is in a position to do the most good.

A scientific observer will say, What can the Geological Survey do without a paleontologist to determine, by fossil classification, the ages of a respective series of rocks, or of a chemist, by analysis, the nature and material of the ledges? With information furnished by these assistants, in their special lines, the general economic or historical geologist is enabled to classify and describe formations, and thus distribute a guide for more practical deductions in the hands of the mine expert or ordinary prospector. The management of the Geological Survey, as is bound to be the case with any large organization, is not above criticism. We would suggest a more rapid publication of results already collected in accordance with existing regulations of the government printing office; a publication of the topographic maps if possible prior to the geological colored sheets, separately if practicable as a guide for the surveyor and traveler; and more care used in the appointment of specialists, so that each State, particularly in the West, should be represented by a specialist familiar with the needs and wishes of his respective locality.

To the mind of the average intelligent reader, there can be no doubt but that the work should be carried on in accord with the general scheme of the past few years, and appropriations should be increased rather than diminished. It is to be hoped that if an extra session of Congress is called by the President, an attempt will be made to restore that part of the appropriation at present taken from the survey, and as the organization corrects these various faults, a bureau upon a firm basis should be established, of pride to our own country and the world at large.

THE pay roll of the United Verde Copper Co., Arizona, foots up from $14,000 to $15,000 per month.

Amending the Hydraulic Mining Bill.

Had it not been for the fact that Senator Felton, of California, desired to suggest some amendments to the Caminetti bill as it passed the House, it would have been considered by the Senate before this. Messrs. Felton and Caminetti have had a conferrence on the subject, and Mr. Felton says the amendments proposed by him and accepted by Caminetti to-day are about 30 in number, and most of them immaterial, being merely changes in the phraseology. Two of them, however, are important. One provides a penalty of from $1000 to $5000 fine for violation by the miners of the conditions imposed by the United States Mining Commission; another amendment changes Section 24, and provides that the Government commission may confer with the California State Commission, if the latter is so authorized by the legislature, concerning the drainage of the rivers and the reclamation of river lands, such plans to be approved by the chief engineers of the War Department; but the following clause, which was objectionable to some of the river and valley men of California, has been stricken out, viz.: "The consent of the United States, in so far as it is necessary to confer the same on account of its reserved control over said navigable rivers, is hereby granted to the State of California, or any municipal or local organization authorized by the laws of said State, to construct said works at its expense; provided that whenever the navigable waters of said system are or may be affected thereby the plans therefor shall be resumed by the commission created by this Act and approved by the Chief of Engineers of the United States Army."

The understanding now is that the Senate Committee will report the bill favorably this week, which should insure its passage, as the amendments simplify the bill. The fact that the platforms of both the Republican and Democratic parties of California indorse the miners' position has had great influence to a favorable consideration of the bill. The resolutions adopted by the two party conventions have been printed and distributed among the members of Congress to direct attention to the importance of the bill. A strong effort will be made to pass it before adjournment.

While the matter is being considered in Congress, the Anti-Debris Association is calling for a convention of five of the valley counties at Sacramento on Saturday, to fight the whole proposition on general principles. The leaders of this movement are men who were invited to come and confer with the miners at their convention. They did not come, but do not return the compliment. In fact, they desire no conference, having their own fixed opinions which no mere facts could not change. They want to continue to thrash over the old straw and renew the old agitation. They ignore the fact that the miners want to impound the debris, and they oppose the building of dams as dangerous, though the engineers state there can possibly be no danger, as the dams are for sand, not water. They set up their opinions as against those of skilled engineers, misquote the report of said engineers, and endeavor again to arouse the old feeling of warfare between the two classes. And all this because certain miners kept on at work when they should not have done so. The Miners' Association did all they could to prevent this, but it is impossible to make all men act decently when self-interest is at stake.

It is not probable, however, that the acts of the proposed convention will have any special influence at this time. Five years ago it would have been different. But there is a disposition now to give the miners a show. They have been the "under dogs" in the fight too long. These valley farmers are thoroughly selfish in this matter and do not wish any plan adopted which will again let the miners resume their work. They place no faith in dams or restraining works, and want no trials made. The public, however, thinks differently and want the miners to see what they can do toward keeping their debris back. If the attempt is a failure it will be time to stop them then. But for a lot of men whose occupations are entirely different from mining to sit in judgment as to the way miners should work, is absurd, to say the least. A few representatives of five counties should not be permitted to set the rule for the rest of the State on a matter of this moment. The miners invited to their convention every county in the State, valley and mountain; but the farmers of the valley will talk only among themselves. They will find, however, that the people of this State want the gold in those mountains and if there is a way of getting it out they want to see it tried; and now that Congress is about to provide a means of trial, little attention will be paid to the selfish remonstrances of interested parties.

A Rock-Drilling Contest.

Following the lead of the Denver and Helena National Mining Conventions, the State Agricultural Society of California intends, in connection with the forthcoming mining exhibit at Sacramento, to arrange for a rock-drilling contest. The trial of skill will consist of single and double hand drilling in granite, as it is not practicable to obtain quartz of sufficient dimensions and having the proper uniformity of character. Contestants will have to furnish their own tools. The duration of each match will be 15 minutes, whether for single or double hand contests. All contests will be held in the evening in the State Agricultural Pavilion by electric light and be presided over by time-keepers, judges and measures to be appointed by the committee. The size of the steel in single-hand contests will be five-eighths inch octagon and for double-hand seven-eighths inch octagon. The trophies will consist of handsome gold medals and cash prizes for the champions and cash prizes of smaller amounts for the second and third teams. This will be the first event of the kind in California, and it is intended that in case the winners shall belong to this State, they shall challenge the Colorado and Montana champions to similar contests at the World's Fair next year. The winners at the Helena, Mont., contest of double-hand drill work made a record of 33 5-16 inches in 15 minutes and of the single-hand drill work of 22 11-16 inches.

The proposed contest will attract considerable attention among working miners and the general public, but the mine owners would be more interested in a competitive trial of rock-drilling machines rather than men. In these days machine labor in rock-drilling has so far displaced hand labor that such personal contests have no longer the value they formerly had. It is only in the smaller mines that this work is done by hand. All mines of any size use machine drills, of which there are various types. They do the work so much cheaper and quicker than men can do it that no mine is properly equipped without them.

An Improved Water Gauge for Boilers.

In the usual construction of water gauges, a single vertical glass tube has its upper and lower heads connected respectively with a chambered metal head, these heads being attached to the boiler above and below the water line, the glass tube being secured at each end in a stuffing-box to prevent leakage. This construction prevents any draft of cold air from the outside to strike the heated glass tube, which is very liable to break, and the connection at the stuffing-boxes is such that the tubes often break, especially at the lower stuffing-box, by reason of the unequal strains, etc. William A. Woods of this city has patented through the MINING AND SCIENTIFIC PRESS patent agency an improved gauge which overcomes these objections by providing a protection for the glass gauge, by surrounding it with an exterior tube with a nonconducting column of air between them.

The outer glass fits in a collar above and below. The upper collar is movable, permitting the glass to slide vertically when desired. At the lower end of the gauge is a small wheel operating a screw controlling the lower collar. The inner glass rests, at both top and bottom, on rubber gaskets and by means of the wheel the movement is corrected vertically, so as to raise or lower the glasses and center the inner glass steam tight in its gaskets. By this means, should the inner glass break it is readily and quickly removed and a new one substituted, without any trouble in repacking. The outer glass can also be easily changed. The inner or water glass itself, being covered by a second and larger glass tube, is not subject to drafts of cold air which cause breakage. Perforations are made in the upper collar which prevent the glass becoming clouded, so that the inner tube can always be seen. The owner of this patent is in the East making arrangements for the manufacture of this water gauge on a large scale. Being a safety device, as guarding the water glass from breakage by drafts of cold air, this gauge is specially useful for locomotive boilers, although it is adapted for general use on all sorts of boilers.

Foundry Notes.

AS STATED in the MINING AND SCIENTIFIC PRESS two weeks since, the Fulton Iron Works has not definitely settled on building their new plant at Baden, although that point had been under consideration. The Hays tract, at the foot of Union street, Oakland, and fronting the harbor, offers an eligible site, and the new works will be put there provided the citizens of Oakland raise the desired bonus of $50,000. The Oakland Water Front Company has offered inducements independent of those tendered by the citizens of Oakland. As the matter now stands it all rests with the citizens. If they can raise the $50,000 bonus agreed upon, the site will be selected. The place is the Hays tract at the foot of Union street and extending almost to First. The tract comprises 42½ acres. It is adjoining the large switching and engine yards of the Southern Pacific Company at the end of the mole. Between the Hays tract and the Oakland harbor is a strip of land belonging to the Oakland Water Front Company. This the company will sell at a very reasonable figure, or sell a strip 600 feet wide so as to give the iron works a good frontage, with the privilege of buying the rest later. Mr. Spiers states that the offer of the Water Front Company is satisfactory to his company and it will not be their fault if the scheme falls through. It is the intention of the Fulton Works, if they take this site, to fill in the marsh land and to excavate a dock. The iron works and shops will be built on both sides of the dock. A committee of citizens of Oakland is now engaged in soliciting subscriptions to the bonus and some $4000 of the amount has already been pledged. If, however, the amount desired is not raised, it is probable the new works will be put up at Baden, for the owners of that property hold out very liberal inducements.

THE Engineers and Iron Founders' Association of California was organized in this city to oppose the molders' strike and succeeded in defeating the Molders' Union after a long and bitter contest. It is composed of the firms engaged in the general foundry business and supported by their subscriptions. Where special subscriptions are necessary, they are proportioned to the importance and volume of business of the works. The association is in a prosperous condition. At the annual meeting on Monday, Ira P. Rankin, the president, having retired from active business, declined a renomination. A vote of thanks was tendered the retiring officers for their successful management of the affairs of the association, and the following directors were elected for the ensuing year: James Spiers of the Fulton Iron Works, William H. Taylor of the Risdon Iron Works, L. C. Marshutz of the National Iron Works, A. Chartrey of the J. Hendy Machine Works, and Wales L. Palmer of the Golden State and Miners' Iron Works. Representatives of all the shops connected with the association were present and stated that harmony prevailed between the employers and workmen.

THE Pacific Mail Steamship Peru, recently launched at the shipyards of the Union Iron Works, and the largest commercial steamship yet constructed on this coast was speeded on her trial trip over the Government Course from Pigeon Point to Point Sur on Sunday last. The course is 58 nautical miles, a little more or less, and to earn the Government subsidy the steamer had to show a speed of 14 knots, or to cover the distance in a few minutes over four hours. She actually covered it in five minutes under the four hours, showing an average speed of 14.96 knots during the test. Her best running was during the middle of the course, when the steamer held 15 knots for three consecutive hours. The run commenced at 2 h. 21 m. 20 sec.; it closed at 6 h. 16 min. 20 sec., so that the run had been made in 3h. 55 min., and the Peru had six minutes to spare. Her speed over the couree was officially given as 14.96 knots; had she got in half a minute sooner it would have been 15 knots. The Peru is 334 feet long, 45 feet beam; mean draft 19 feet; displacement, 4450 tons. The vessel left for China this week on her maiden voyage.

Coast Industrial Notes.

NEW and improved cars have been put on the San Diego electric street railway.

PETALUMA'S new silk factory will be ready for work in a few days, the building having been completed.

THE Rio Grande Western has put a force of men at work laying track westward from Salt Lake City.

STEPS are being taken for the development of the artesian belt of Alvarado with a view of supplying the town of Haywards.

SALEM, Oregon, is extending its street railway system, and is also making telephone connections with neighboring towns.

PROPOSALS are advertised for the improvement of Alamo square in this city, for which the $15 000 appropriated by the Supervisors is now ready.

THERE is again talk of developing the nickel mines at Olalla, Oregon. The mines have been known a long time, but they have never been properly opened.

THE brick engine and car house of the Point Lobos and Geary Street car line is approaching completion at the northwest corner of Point Lohos and First avenues.

NEARLY all the buildings at Vacaville injured by the earthquake of last April have been repaired, and in every case the buildings erected have been improvements on the old ones.

THE machinery at the iron-plating shop at Mare Island, recently set up, is in operation, being driven by the new Corliss engine. The machinery in the smithery will also soon be connected with it.

ENGINEERS are at work toward changing the Berkeley horse car line into an electric road. Colonel Meyers, of the California Railway Company, says that the transformation will be made within the present year.

THE last carload of oranges for the season of 1891–92 has been sent forward from Riverside, San Bernardino Co. The shipments of oranges and lemons from that settlement during the season foots up a total of 402,030 boxes, or 1406 carloads.

THE Regents of the University of California have advertised for bids for the construction of a building for a new department of the university, to be known as "the mechanical and electrical engineering department of the University of California."

THE East Oakland Street Railway Company has recorded a mortgage to-day on all their estate, rights and franchises for $250,000 to the California Safe Deposit and Trust Co. The mortgage was effected to secure 6 per cent bonds, to be issued by directors.

A NUMBER of employes of the Carson Mint have been paid off. The mint appropriation was reduced $11,000 for labor and $4000 for supplies this year, and the institution has been closed down to await the appointment of a new superintendent to succeed the late Samuel Coleman Wright.

THE Tuscarora Water Co. has held its annual meeting and has elected the following directors: P. C. Hyman, Thomas Bell, Daniel Meyer, John R. Spring and W. E. Davis. P. C. Hyman was elected president; Thomas Bell, vice-president; J. W. Pew, secretary, and H. W. Coffin, superintendent.

A STRIKE of red oil at a depth of 80 feet is reported in the Buena Vista oil fields, 36 miles west of Bakersfield, Kern county. The well has a capacity of 25 barrels a day, but pumps will he necessary. It is claimed tbat this oil has a paraffine instead of the usual asphaltum base of the California oils.

WHILE in the Mare Island dry dock, the work of strengthening the stern of the Monadnock will be prosecuted. She will ultimately be provided with new propellers of an improved pattern. A large gang of men are at work aboard of her and on various parts of her outfit and engines in the shop.

AT the Mare Island Navy Yard, the Ordnance Department has a small force employed in necessary work. The new buildings proposed for preparing ammunition will probably be located near the naval cemetery, between two hills, where danger will be less liable to surrounding property in case of another accident.

FRANCHISES have been granted for eleectric roads on all streets in Oakland between 7th and 16th, except 10th, and one has been applied for on tbat street. The residents, however, object, as it is very narrow and the only street for driving between those named. The 16th St. road is running and that on 14th will be this month.

WORD has been received at the Mare Island Navy Yard to commence making the necessary repairs to the Thetis. She will he fitted with a new propeller and of a style tbat is expected to develop considerable speed. When ready for sea, she will go down the coast as far as lower California to complete unfinished surveys of the coast.

THE shipments from San Diego to Mazatlan are increasing. The last steamer took down the largest consignment yet made, consisting of fruits, cheese, pickles, canned goods, potatoes and vegetables. The fruits embrace peacbes, apricots, apples and other fruits produced in the vicinity. The returning cargo will consist of tropical fruits for the San Diego market.

THE San Luis and San Joaquin Railroad Company has been incorporated with a capital stock of $1,000,000 to construct a railroad northward from San Luis Obispo to El Moro, a distance of about 10 miles. There is a good bay at El Moro, but its entrance is obstructed by a rock, whicb could be removed without any very great expense. Vessels of deep draught cannot now enter tbe bay, though coasting schooners do so.

AFTER 158 ballots in the San Jose Common Council, plans were adopted for the new Central school building, for the erection of which it is proposed to issue bonds in the sum of $150,000, of which $50,000 are for sewer purposes. The plans of Fred T. Peterson were adopted. The building from his estimate will cost $75,000. There were nine competitors for the prize.

IT is probable that there will be a consolidation of the interests of the Giant Powder and Safety Nitro Powder Companies before long, in which case a very powerful high-explosive manufacturing company would result.

OUT of 108 ships lying in San Francisco hay disengaged, 78 are English. Of the 120,000 tons of shipping here, nearly 40,000 tons are in ships which have recently arrived and are not yet ready to take freight. There are quite a number of big ships at Martinez and other places lying idle waiting for wheat.

VACAVILLE, Solano county, is very active. The fruit crop in the valley is the best ever known, and already this season over $1,000,000 has been paid to the fruit growers for orchard products, and it might be said the season has but commenced. A corporation has just been organized for the purpose of erecting a fine hotel in the town. It will be three and a half stories in height, with all modern improvements.

THE Portland (Or.) Water Commission has definitely decided to lay pipe to Bull Run of a size to furnish a supply of 22,500,000 gallons a day, equivalent to 150 gallons each day for a population of 150,000. The superintendent was directed to prepare specifications to be all completed by December. Bids will be taken so that work on the line can be hegun in the spring. The line will be 30 miles long and water will be supplied from a lake on the spur of the Cascades watershed, about which a tract comprising 300 square miles of forest land has lately been set aside as a Government reservation by President Harrison. There is a chance for pipe manufacturers to get quite an extensive contract.

THE work of closing the gap on the coast line railroad of the S. P. Co. between Santa Margarita and San Luis Obispo is being pushed rapidly. A large gang of workmen is at present building stone culverts on the extension, and they are getting ready to commence tunelling the mnuntains. When the line is completed, overland trains will be put on to run between San Francisco and New York. The southern overland trains will no longer have to come over the Tehachapai and valley route. San Jose will then be on an overland line. Some very extensive tunnel work is to be done on the new line this side of Santa Barbara.

THE San Diego Electric Railroad Co. has several hundred men at work on the different branches of labor, changing the street railway system to an electric system. An electric power house and car shops are being constructed at the foot of E street; double tracks have been laid from the water front on H and Sixteenth streets and Logan aveoue for a distance of four miles, and on Fifth street from the water front to University avenue, a distance of three miles. Trolley wires are being strung, and it is expected that the system will be able to start on tbe 1st of September. Several cars for the new road have arrived, and others are on the way.

MOUNTAIN VIEW, Santa Clara Co., is to bave extensive brick works organized. The Whartenby ranch, consisting of 200 acres of land, has been purchased by M. Salomon & Co. of San Francisco, who, in conjunction with T. Peterson and E. Kartschoke of San Jose, propose establishing the largest and most complete brickyards and starch factories on the Pacific Coast. Mr. Kartscboke bas just returned from an extensive trip through the East and Europe, during which visit he thoroughly examined the most approved machinery for brick and starch manufacture. The clay found on the proposed site is pronounced by experts to be of tbe most superior kind and practically inexhaustible. Electric power will he used in the works, and an electric railroad will be built to navigable water on the bay, which is only three miles distant. From this point the output will he carried to San Francisco and other points by steamer.

THE prospect that a San Francisco contractor will obtain the contract from the United States Government for the construction of the large dry dock at Port Orchard, on Puget Sound, is becoming brighter every day. The two local bidders on the work are J. P. M. Phillips and tbe San Francisco Bridge Company. It is understood that the Department of Yards and Docks at Washington has considered Phillips' bid favorably, although two Eastern hidders have submitted lower bids. Mr. Phillips' bid is $520,000 for the entire work. The dock will be the largest on the Pacific coast, and 200 men will be employed for three years in its construction. Over 3,000,000 feet of lumber will be used and 11,000 piles will be sunk. The cost of the granite to be used will be over $100,000, and the construction of the caisson and pump will cost over $118,000. Over 600,000 brick and 264 000 feet of concrete will he nsed, and 116,000 yards of grading will be done. The dock will have a depth of 46 feet, and will be 110 feet wide and 565 feet long.

OF the 4500 members of the Mechanics' Institute, only 1451 responded to tbe trustees' invitation to express a preference as to whether the present building on Post street should he remodeled or a new library building erected on a portion of the Mechanics' Pavilion lot or in the locality bounded by Powell, Post and Market streets. Of tbe 1451 responses received to this question, 760 favored the former plan, 278 supported tbe idea of a new building on the Pavilion ground, 398 advocated the purchase of a lot between the district outlined, and 25 offered as many different suggestions not called for hy the circular of invitation. If the trustees pursue the plan favored by the majority, they will overhaul the building on Post street, put in it all modern improvements and utilize the entire structure for library and institute purposes. This plan would give the institute sufficient accommodations until the growth of the city makes it expedient and desirable to build on the Pavilion lot at Larkin and Hayes streets.

Personals.

CHARLES SLADE is superintendent of the Golden Gate Mining Co., Sparta, Oregon.

C. E. CHAMPIE is about to put up a 5-stamp mill for his 13 claims in Humbug district, A. T.

GENERAL R. P. KEATING and Frank Golden have been inspecting the Pine Nut mines, Nev.

G. F. DEETKIN, the well-known mining engineer, has purchased the Salsig mine, Placer county.

ALEXANDER and Hiram Tickel are in Fresno, and are about to prospect for natural gas and artesian water.

THE R C. mill near Brownsville, Butte Co., is in charge of E. W. Slater, and J. C. Campbell is superintendent of the mine.

DANIEL E. SAUNDERS is superintendent of the Reward mine four miles from Vekol, Pinal Co., A. T. The mine is owned by a Boston company.

SAMUEL L. JONES, the Comstock superintendent, has been East for a month, hut is expected back shortly. Senator Jones is also expected soon.

U. S. CIRCUIT COURT JUDGE MCKENNA intends shortly making a personal inspection of the North Bloomfield mine before rendering a decision in the case before him.

BUGARD WILKESON is the recorder of the new Bridge Creek district, Washington, including the camps of Bridge creek, Park creek, Horseshoe basin, Little lake and North Fork Bridge creek.

J. W. ROBERTS and G. A. Fredickar have been visiting the Rose mine in Mornngo district, San Bernardino Co. D. A. Wheeler is superintendent of the mine and W. B. Taylor, assayer and millman.

L. P. W. QUIMBY and A. Alger of Portland, stockholders of the Grant Silver Mining Co., have been visiting the mines of Greenhorn, Oregon, and are pleased with the showing made on the properties.

HENRY ARMITAGE of Denver, who recently returned from Johannesburg, South Africa, is in Arizona, where he is superintending the placing of a new 100-horse power Corliss engine and 20-stamp mill on the Hillside property.

DR. F. R. WAGGONER has been making a practical test of ocean-beach mining on Monterey bay, using the Ball-Norton electro-magnetic separator. He is president of the Pajaro Mining Co. which is operating in ocean-beach sands.

EDWARD RIGNEY is at Mokelumne Hill, Calaveras Co., making the necessary preparations to commence work on a blue gravel claim near the Junction on Chili gulch. The necessary machinery is heing procured. The Encino Blue Gravel Co. is an Oakland corporation owning the mine.

W. B. THORP of the Newcastle *News*, Newcastle, Placer county, has received the Republican nomination for State Senator in the 5th senatorial district, which includes Placer and El Dorado counties. Although from a fruit-producing region, Mr. Thorp is a friend to the mining industry and is an able young man.

THOMAS B. EVERETT, secretary of the Placer County Miners' Association, made a call at our editorial rooms this week. Mr. Everett is the man who suggested the calling of the State Miners' Convention and tbe organization of miners' associations. At the recent Republican Convention in the 13th Assembly district, he received the nomination for the Assembly from Placer county.

JAMES MARTIN has raised another excitement in Cook's Peak district, N. M., by uncovering one of the richest ore bodies yet found in the camp. Mr Martin is one of the best miners in New Mexico, and has made several rich discoveries for others in both Grant and Sierra counties, as well as elsewhere. His prospects are good now to make a "stake" for himself and the owners of the property.

ARCHIE MCNABB has gone to Lundy to try and get a 5-stamp mill to put up at the Green Creek claims. A number of claims have been located along the supposed course of the ledge, north and south, upon some of which work is being done. The most southerly location extends to the base of Castle peak, where very rich float has frequently been found. It has long been a pet theory witb old timers that Mono diggings were fed by an overflow from some point in this vicinity.

J. H. HEDGES, treasurer of the Utah-Gold and Silver Extraction Co. is in Esmeralda Co., Nev., where he has contracted for 6000 tons of gold tailings from the Pine Grove mine. He intends to put up a cyanide mill of a capacity of 50 tons per day. The tank will be 100 feet long by 16 feet wide, and will hold 136 tons. The tailings contain about $12 per ton, and the company expects to work it at a net profit of $8 per ton. It expects to complete the run in about five months.

COL. C. C. LANE, superintendent of the Tanama Mill and Mining Co., Lower California, intends removing to San Diego with his family. Col. Lane has had a long and varied experience as a mining superintendent. The first property of which he had charge was the Buel North Star mine, in 1867, and since then he has superintended the Timoke, Plymouth, Indian Queen and Lane & Fuller mines in Nevada, the Hackberry mill and mine and the Howell Smelting company's property in Arizona, the Lane & Kurtz mine and mill in British Columbia, and the Alamo Mill and Mining company's property in Alamo.

MORRIS DUSSELDORF, manager of the Comstock Mining Co., at Park City, Utah, accompanied by A. Hanauer, Jr., one of tbe directors, has been making a thorough examination of that property and making an exhaustive report as to its condition and the best means of working it at the present time. After this report is prepared and submitted, Mr. Dusseldorf will leave for New York to place the stock of the corporation, most of it having been subscribed for. Mr. Dusseldorf says developments will he prosecuted hy means of a shaft, and that sufficient machinery will be put in to go deep and at the same time handle wbat may be encountered.

The Mines of Siskiyou County.

FORT JONES, SISKIYOU COUNTY, CAL., July 22, 1892.

TO THE EDITOR:—The mines of Siskiyou county are steadily moving forward and increasing their yield. We are anxiously awaiting the publication of the annual report by the U. S. Mint so as to verify our claims to the fact that we are the first among the few counties of the State of California which have increased their bullion yield in the year 1891. Our county contains 3,890,000 acres of land, 3,000,000 of which may be said to be mineral lands. Our grand old mountain covered with perpetual snow, now having the sun's warm rays upon it affords the miners ample Shasta water for hydraulicking, and, by a very slight manipulation with lemons from San Bernardino county, we have most delicious Shasta lemonade to quench our thirst this hot weather. The farmers throughout the many beautiful valleys in this county avail themselves of Shasta water for irrigation, and it increases the yield of their land ten fold. We claim more nutriment in our farm products than can be found in any other part of the State. We also claim that we have more ozone to the square inch than can be found anywhere on the Pacific coast.

Our operations in developing the high benches in the mountains have been very successful. In my next I shall endeavor to give you a tabulated statement of the yield and altitude at which placer gold has been taken.

Every mining district in this locality can point to new developments and we are proud to say they are all of a substantial character. On Jackson creek, in the South Fork district near Callaban's ranch, New York and Boston parties have taken up a large tract, and they are piping down a spur of the Salmon mountain with a 15-inch pipe and 15-inch giant. The Etna district adjoining has several new drift and placer mines. The Quartz Valley district adjoins the Etna. Here is located the famous Campbell mine, with its several giants and drifts in full operation. Near by, on Shackelford creek, an Oregon company is piping away with a 15-inch pipe and 11 inch giant. The Salmon River country has several new mines opening this summer. It was only a short time ago that 200 pounds of gold passed through Fort Jones from Sawyer's Bar to the United States mint. This much could be said of Scott Bar, Humbug, Klamath and other districts in Siskiyou county. So if you have not heard from us for some time you can rely upon it that the miners of Siskiyou county are alive and active.

There is a movement on foot to provide and maintain a fully equipped hydraulic outfit to work and exhibit at the World's Columbian Exposition at Chicago next summer. Some enterprising manufacturers in San Francisco have pledged the entire outfit as a donation. This exhibit will not only help our county, but will be a great benefit to all mining counties in the State. Any suggestions relating to this exhibit, from practical hydraulic miners, would be gladly received by the Chairman of the Siskiyou County World's Fair Auxiliary Association at Fort Jones. Yours truly,

PLACER.

The Crawford Mill.

MARYSVILLE, MONTANA, July 28, 1892.

TO THE EDITOR:—My attention has been drawn to statements recently appearing in the daily press of Helena, Montana, and also in *Engineering and Mining Journal* of New York to the effect that the Crawford crushing and amalgamating mill has been operated upon pan tailings from the Montana Company's mill at the Drumlummon mine, and that it effected a saving of 50 per cent from tailings of $1.60 value per ton.

The articles in the daily press make me indorse the machine. I beg to state that the Crawford mill has never been employed at these works, and has never worked any tailings from our pans or mills. I know nothing about the Crawford mill or its operations, and have never seen the machine. The use of my name or that of the Montana Co. is without warrant or permission.

G. H. ROBINSON,
General Manager Montana Co. (Limited).

The Mercury Mines of Almaden.

The following description of the mercury mines of Almaden is taken from the *Journal de la Chambre de Commerce de Constantinople:* The mercury mines of Almaden, in Spain, are a short distance from the town of that name, following the valley in a northerly direction. The veins of the precious metal are disseminated a little haphazard, but those at present in working, form altogether a zone stretching for a length of from 160 to 170 meters, and which is only from 10 to 12 meters wide. The depth of the bed is still unknown, for the reason that when a vein is exhausted, the depth of the well is increased in order to reach a new vein. Between the different workable veins there are beds of ores and rocks of different kinds; the average thickness of the unworkable beds varies between 10 and 37 meters. The deepest gallery at present reaches 317 meters. A curious feature is that the farther the distance gone, the quality of mercury improves and the quantity increases. In the 10th and 11th galleries (the deepest), the mercury runs, so to speak, from the rock as resin exudes from the trees. The rock varies in color and passes from black to brilliant red; the more the color approaches red, the more the quantity of mercury increases.

The pits at present in working, number three. The other old wells have been abandoned, and only serve in exceptional cases. On delivery from the pits, the ore is smelted in vast furnaces, with enormous cupolas, beneath which a fierce fire is constantly kept burning. Distillation is effected through a long and complete series of tubes, formed of thick jars, with a long and narrow neck, fitting into each other. In the lower portion of these jars there exists a kind of small reservoir, where the drops of mercury produced by the evaporation of the metal in a state of fusion are condensed. These drops are then collected, and with the aid of small pipes, stored in large iron barrels. The production of mercury reaches about 55,000 to 60,000 frascos per annum; the frascos are bottles of cast iron, which contain four arrobes of about 25 pounds each. The workmen at present employed number about 2000. There are also a thousand workmen who are employed out of the mines with machinery, furnaces, transports, and other works.

The Gold Belt of the Atlantic Slope.

The gold belt of the Atlantic slope, says the Richmond *Trade-Journal*, is worthy of more attention than this publication has heretofore been able to give it. That the belt is more extensive than the gold fields of California goes without saying, and that in the near future it will show its value to all the world can be assured without question. We are, however, more interested in the Virginia part of the belt, which may be said to begin at the Potomac river and thence through the State in a southwesterly direction to Halifax county, and instead of its being only 20 miles it will likely be found to be nearer 50 miles wide (as the new discoveries in Floyd and Carroll counties prove). The recognized gold belt in Virginia, according to the work of 40 years ago and down to the present time, takes in Loudoun, Fauquier, Culpepper, Stafford, Orange, Spottsylvania, Louisa, Fluvanna, Goochland, Buckingham, Charlotte and Halifax counties. Probably the richest counties in Virginia are Fluvanna and Goochland, in which is the Hughes mine. Probably the best gold mines on this end of the belt is the one 5½ miles from Bremo Bluff—the Long Island mine, near the Rivanna river, one mile from Wilmington (which was worked with great success in 1854 by Commodore Stockton); the old Tellurium mine (also at one time worked by Com. Stockton); the Busbys and Collins and Moss mines, each of which were favorably reported upon by eminent experts as long ago as 1844. Then comes the Tagus mine, four miles from Columbia, Va., which also has a fine new mill capable of milling 20 tons a day. Extensive development work is being done in this section, notably on the Bowles mine of 800 acres, owned by Philadelphia men and which is in charge of Mr. Russell Willard, a very bright young man, who has had the advantage of three years' experience on an extensive silver mine in Old Mexico. Then good work is being done by old Colorado mine, on the Mass mine (which joins the Bushy), where a shaft is being sunk to 500 feet depth and is very rich ore (the ore in this camp is considered the richest average in this part of the Virginia belt, being worth, at 95 feet depth, $40 a ton). The values in this section are principally in the veins, all of which, so far as known, are true fissure veins, yielding from $10 to $200 a ton. There is one mine in this group, however, which is both a vein and placer property; this is the Callus mine, which, it is claimed, is one of the best, if not the very best, of the placer properties in Virginia.

In this camp there seems to be a determination to get in shape to take out the values in a regular, legitimate business way. Gold mining has ceased to be a doubtful business, for under the improved processes and with modern machinery, results are certain and sure. Gold mining now is attended with no more risk than cotton spinning or coal, iron, zinc or lead mining. This could not have been truthfully said some years ago. What is being done daily on this belt proves beyond any question that gold mining is as sure as any business in which capital can engage. The errors of the past are the safety of the future.

Northeasterly, the belt extends into Montgomery county, Md., where Senator Sawyer owns a fine gold property for which he has refused $250,000. This property was developed by Dr. Kemester (lately Commissioner of Emigration in Europe). Then, near the Sawyer mine, is a very rich property owned by Chicago men. Mr. Russ, one of the owners in charge, took out in one week, during his drifting at about 70 feet below the surface from rock here and there, over one pound of gold, worth about $225. The Virginia gold mines (best in Fluvanna and Goochland counties) are not so rich in free gold as the two in Md. (as above), but the veins are more uniform in width, depth and value. The best authority gives the probable depth of the Central Virginia veins at 2000 feet.

Smelter at Needles.

T. R. Gabel, general superintendent of the A. & P. R. R., passed through Kingman, Tuesday, in his private car, says the Mohave *Miner*. Mr. Gabel was present in Needles while a meeting of the stockholders of the Needles Reduction Co. was being held, and it was at that meeting that it was decided that the plant erected by that company to treat ores by the MacArthur-Forrest or cyanide process was a decided failure. The company made a number of tests on a large scale on ores from different mines in San Bernardino county, California, and Mohave county, Arizona, which demonstrated unmistakably that some radical improvements must be made in the modus operandi of the process before it can possibly be made a success. Having arrived at this conclusion, it was next decided to erect other reduction works at Needles and a thorough and complete knowledge of the character of the ores to be treated and the means and facilities at hand for transportation and reduction, induced the company to arrive at the conclusion that a smelting plant was required. With the energy and enterprise that has characterized all the actions of the company, they immediately proceeded to contract for a $250,000 smelting plant. The A. & P. railroad company will haul coke, coal, limestone and iron, as well as ores, to the smelter at greatly reduced rates, thus enabling the smelting company to bid for the low-grade ores of Mohave county, which until now have been worthless on account of the high price of transportation and reduction. The mines that were capable of producing high-grade ores in paying quantities have been pretty closely worked for the past 20 years, and now what Mohave county needs is a chance to work low-grade ores at a profit. By low-grade ore we mean ore that will run from $25 to $50 per ton. Of such ores, the supply is almost inexhaustible.

The erection of this immense smelting plant at Needles will create a new demand for lead ores, and render the low-grade lead mines of this county that are now lying idle, profitable producers. Prospectors have been sent up the Colorado river in search of lead ore, immense deposits of which are said to exist north of El Dorado canyon on the Nevada side, not far from the river. An agent of the smelting company has been supplied with the necessary funds and empowered to erect a sampling works at the new camp of White Hills, and purchase the ores of that and surrounding camps for shipment to the smelter. It is not yet fully decided whether the ore will be hauled to Kingman and shipped by rail to Needles, or whether it will be hauled directly to the river and from there by boat to the works. While the road from White Hills to the river is only about one-half the distance to Kingman, yet the natural disadvantages of the former route are so great, owing to heavy grades and sandy roads, that it seems more than likely that the route by way of Kingman will be far more practicable and cheaper. The price now charged for hauling ore from the new camp to Kingman is $30 per ton, and teams are always loaded both ways. This is far in excess of what the hauling can be done for to a profit. It will only be a short time after teams sufficient for the demands of the camp come in, until ore will be hauled for less than half that sum. Transportation by means of the little flat-bottomed steamers that ply the Colorado, is scarcely less expensive than hauling on wagons. Mr. Gabel expressed himself as favoring the route via Kingman.

Asphalt in the Trades.

From the beginning of the rubber business, manufacturers have appreciated the use of asphalt and tar in a variety of rubber compounds. Especially has this been true in goods cured in what is known as the dry heat. Boots and shoes, clothing and insulated wire compounds to-day all have a certain percentage of what is known as tar, but which is usually purified asphalt. The common belief that the goods are injured by the addition of this substance is wholly erroneous; a certain amount of asphalt compounded with rubber assists in calendering, and during vulcanization imparts a certain toughness to the rubber which is not to be gained in any other way. The proportion used to-day is but small. For example, what would be known as a rich compound is 18 pounds coarse Para, 11 pounds litharge, 40 pounds whiting, 3 pounds asphalt, ½ pound lampblack, 11½ ounces of sulphur. Exactly what asphalt is, very few people seem to know, and it is almost invariably in the popular mind confused with coal tar. Asphalt as a paving material has been known since the Babylonian empire, and to-day paving blocks are found that preserve their integrity, and have hardly begun to oxidize in spite of the atmospheric changes to which they have been exposed. It is only within late years that asphalt has been well known in the United States. It looks very much like pitch, and when ignited burns with a bright flame, giving off a dense black smoke. Alcohol, ether, oil of turpentine, naphtha, and many other reagents, easily dissolve it. Its specific gravity is 2.23.

Until very recently all the real asphalt used in this country was imported. There is in the island of Trinidad a lake nearly two miles in circumference, which is the source of the most of it, and it is said that near the shore the asphalt is very hard, but out in the center it is soft and viscid. When imported to the United States, it comes mixed with sand and gravel and a variety of foreign materials, from which it is separated by heating over a slow fire for a week or more. During this heating process, the impurities of a lighter nature rise to the top and are skimmed off, while the heavier substances settle to the bottom of the receptacle. There are very large deposits of asphalt in France and Switzerland, and within the last three years quite extensive deposits have been discovered in Utah and California, and some small ones in Kentucky. For paving streets, it is prepared by grinding first to a powder and mixed with crude petroleum and fine sand. It is then molded into blocks of suitable size, or sometimes it is poured between blocks of paving stones, when it becomes hard and greatly resembles the natural rock.

Another use for asphalt is in the manufacture of black varnish, where it is dissolved in oil of turpentine and linseed oil, and makes an exceedingly durable coating. For insulating electric wires, this sort of coating has been found of great use, and it is said that one of the best rubbers for wires to-day manufactured is made of a fine compound containing 30 per cent of India rubber, the compound, after semivulcanization, being dipped in boiling asphalt, which toughens it exceedingly. As asphalt is not affected by acids or gases, and is an absolutely waterproof compound, and as heat and cold do not affect it, it is a valuable article to use in connection with India rubber, although if too large quantities of it are put in, it shortens the gum, and may, during the process of vulcanization, cause it to blister. A great deal of the gum roofing sold in the United States, which is thought to be India rubber or gutta percha, is made simply from a solution of asphalt spread upon prepared paper.—The India Rubber World.

THE Board of Supervisors of Santa Clara county has granted the petition for a franchise for an electric railway from the Southern Pacific depot through the town of Mayfield and College Terrace to the grounds of the Leland Stanford Jr. University. It is intended also to build a short electric road from Palo Alto station to the university, but this latter road will run mainly through Senator Stanford's private grounds.

At the World's Fair.

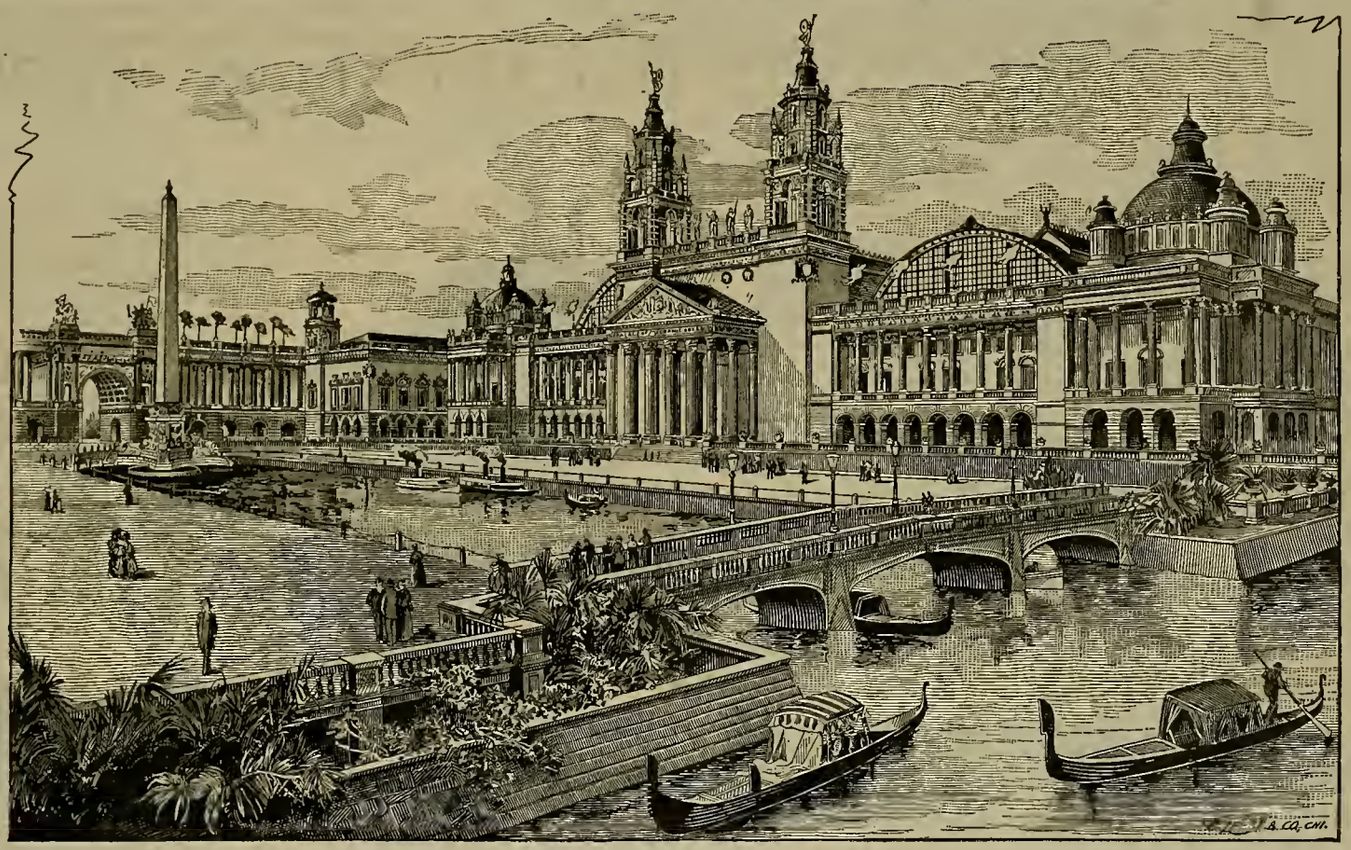
As the time draws nearer to the opening of the great Columbian Exposition at Chicago interest becomes keener in everything pertaining thereto. We have no doubt our friends who are serving upon county commissions and local committees, in solicitation and preparation of exhibits, are continually impressed with the fact that they have much to do in a short time. Those who anticipate a visit to Chicago and the East next summer, after long years of absence, feel their anticipations becoming ruling thoughts. With so much interest to cater to, we cannot probably do better than to present occasional glimpses of the great affair of the future as space permits.

The engraving on this page shows a perspective of the Machinery Hall, or, as its formal name runs, the "Palace of Mechanic Arts," which is now approaching completion at Chicago. The beauty of the building and its environment are striking. This building will be 850x500 feet and cost $450,000. It is located at the extreme south end of the park, midway between the shore of Lake Michigan and the west line of the park.

The building is spanned with three arched trusses, and the interior will present the appearance of three railroad train-houses side by side, surrounded on all the four exterior sides by a 50-foot gallery. In each of these long naves there is to be an elevated traveling crane for mining machinery. Steam power for this building will be shipped from a power-house adjoining.

The two exterior sides adjoining the grand court are to be rich and palatial in appearance. The two facades of Machinery Hall on the court are rich with colonnades and other features.

The design follows classical models throughout, the details being followed from the renaissance of Seville and other Spanish towns, as being appropriate to a Columbian exposition. An arcade on the first story admits passage around the building under cover. A colonnade with a cape at either end forms the length between Machinery and Agricultural halls.



PALACE OF MECHANIC ARTS AT THE WORLDS' COLUMBIAN EXHIBITION.

J. W. STEENS ZYNEN, Inspector for the Board of Horticultural Commissioners of Merced county, and interested in the noted Hollander colony of Merced, states that there are about 60 of the colonists in all, and they are raising olives, almonds, oranges, peaches, prunes, chestnuts and many other things. They got their trees and vines started about a year and a half ago, and next year they will begin to hear a little. About 2000 acres are now planted. The Hollanders got their land of the Crocker-Huffman Company, and it cost a pretty stiff figure—$165 an acre—but this included all the water at any time necessary, and, moreover, the ground was smoothed free of the many small natural humps and holes in it. All of this 2000 acres now looks like a garden. It has been a little slow redeeming the desert and all outgo and no income since the colonists took hold. They are looking forward hopefully, however, when they will draw dividends. There are not many women in the colony, and the few there, are from Holland. Most of the colonists are bachelors.

San Bernardino county is contemplating the making of a native salt palace for the World's Fair, using blocks of crystallized salt that measure 12x24 inches, and are perfectly transparent.

The Gold-Mining Industry of Bolivia.

Concerning the gold deposits of Bolivia but little is known, except that ranking third in the world in the production of silver it is presumably rich in gold.

No reliable data can be obtained upon the matter, there being no Government bureau of statistics, and as the metal is not dutiable, there are practically no satisfactory means of ascertaining the annual production of the mines whatever.

The whole matter must be figured from that which passes through the Customhouse of La Paz, in connection with dutiable articles, as merchandise shipped under the sanction of the Government for its greater security in transportation, which is the commonly accepted estimate. Assuming that one-fourth of the annual production passes through the Customhouse, and that the amount so passing for 1890, as shown by the chief officer of the house, was valued at 27,540 bolivianos, we have the total production valued at 100,160 bolivianos, or in United States Currency, $67,582. The quantity produced was 101 kilograms.

Even this ridiculously low figure shows an increase of $7782 over the amount reported for 1888 and 1889. But these figures are all out of proportion to the reputed richness and extent of the gold-bearing quartz veins and gravel beds of Bolivia, and the causes of this limited production and the evidences of the actual existence of these rich deposits can only be learned by tracing the history and explaining the present condition of gold-mining in the country.

When Bolivia and Peru were under the Imperial Government of the Incas, previous to the Spanish conquest in 1532, gold was regarded as a sacred metal, and was used almost exclusively by the former race in the adornment of their royal palaces, temples and the sacred vestments of the royal household. Not entering, therefore, into the circulating medium of the empire, which had neither commerce nor money, and unconscious of its intrinsic value, the Incas sought gold, not for gain, but out of loyalty to their rulers and unswerving devotion to their chief diety, the sun, to whose worship the gold was mainly consecrated.

Traditions of the Quichua and Aymara Indians, and the oldest obtainable records, dating back to the opening of the 16th century, as well as recent explorations, all agree that the northwest provinces of Bolivia, especially that of Larecaja, are rich in gold deposits; that, while the Incas secured considerable quantities of this metal from the Province of Carabaya, Peru, the northwest provinces of Bolivia were the principal whence came the gold that excited the cupidity of the Spaniards.

Long before the coming of the Spaniards, regular quarterly contributions of gold were made to Chiquitos, Peru, where was located one of the receipt boxes of the empire. The gold was transported in 12 llama bladders, holding from four to five pounds of metal each, and the expedition was made upon the full moon day of each quarter. These bladders, technically termed "rosques" by the Indians, are still utilized in the transportation of gold.

The Incas gathered their gold almost exclusively from the deposits of the mountain streams or from shallow excavations made in the rugged acclivities of the Cordilleras, as is demonstrated by traces of their works and rude mining tools of wood and stone which yet remain. Not understanding the virtues of quicksilver, a mineral not rare in their empire, and being deficient in the art of extracting this metal from the quartz, their most advanced method of smelting consisted of small cone-shaped furnaces built at elevated points where they might be fanned by the mountain breezes. Consequently, they practically but skimmed the surface off of the vast gold deposits of the country, but notwithstanding these primitve appliances, history shows no parallel of such treasures of gold as were found in the royal palaces, edifices and temples of the Incas at the time of the Spanish conquest.

At the time of the Spanish invasion and ultimate victory and destruction of the empire, gold-mining was abandoned by the Incas, and continued so up to the close of the 17th century. This was owing to the latter not being allowed by the Spaniards to decorate their buildings with the precious metals.

But about this time Sorata, the present capital of Larecaja, was founded, and soon became the richest city of Upper Peru, now Bolivia. Soon after this event, the famous gold deposits of the Tipuani river were discovered by an expedition of Spaniards from Chile adventurers. These deposits are located on the eastern slope of the Andes, and from the sands of the river millions of gold had been washed by the Incas before the coming of the Spanish.

In the northwestern portion of Bolivia mining operations now commenced to multiply, and many and vast were the fortunes accumulated owing to the richness of the mines and of the free labor of the Indian slave miners.

An important feature of the mining business at this time was the annual gold sale held at a number of important points in Province Larecaja, and which continues to-day to some extent. The gold dealers from all about are attracted to the trade centers, and the time is given up to trading, making merry and feasting, something like our fall cattle shows.

In 1781 the Indians revolted against their Spanish persecutors, in the section lying between Cuzco, Peru, to Tucuman, Argentine. Sorato was destroyed, the Spanish proprietors and miners were killed, and an end was put to the slavery business. In 1805 work was again resumed in this section. This time a Spaniard led a new expedition into the field, and began operations at a point near Aucota, and for the next 60 years the city paid a net annual profit of from 40 to 60 per cent on capital invested, despite the crude methods employed to carry on the business.

Thus we have an idea of the past condition of things. The principal gold-bearing localities are those belonging to the northern belt of the country, but there are other parts of the country capable of yielding enormous quantities of the metal, as, for instance, the Rio Sinpacha in the southern part of the country, which, like all the other parts, need strong capital and the direction of practical men, aided by suitable machinery and skilled labor, and the result would be most satisfactory.

WARDEN HALE of the San Quentin State Prison has put 25 convicts at work building a road from Green Brae to Tiburon across the salt marsh. The property owners in the vicinity have subscribed a sum sufficient to pay for the necessary tools, the transportation of the convicts and the wages of the guards sent to oversee the prisoners. The new road is to be graded to a height above tide levels, and will be macadamized and made fit to stand heavy teaming.

AT the annual meeting of the stockholders of the Benton Con. Mining Co., the following officers were elected for the ensuing year: John T. Hill, president; E. M. Morgan, vice-president; and Edward Howard, E. Hestus and V. B. Allen, directors. V. B. Allen was reelected Secretary and his statement showed a credit of $44,811.69.

MECHANICAL PROGRESS.

Measuring Steam Consumption for Engines.

There are various ways of testing engines and boilers says the Chicago *Journal of Commerce*, according as the engineer wishes to get absolutely perfect results or, at least, as close as he possibly can, or whether he wants to get an approximation and would be satisfied with only a moderately accurate estimate. A test of the economy of an engine is always on the basis of the number of pounds weight of steam that the engine will use, or, what is equivalent, the number of pounds of water required by the engine per horse power. One method of finding this is from the indicator card. We take a card, and, as it gives the pressure of the steam at all portions of the stroke, we can take any part of the stroke and figure what volume is occupied by steam, how many cubic feet of space in that cylinder the steam fills at the point in the stroke, and looking at the indicator card, we see the pressure of the steam at that point. That is all that is necessary, for, turning to a table, we find that at that pressure a cubic foot of steam would weigh so many pounds, and, knowing how many cubic feet of steam there are, multiplication does the rest. This is for one stroke, but it is easy enough to multiply by the number of strokes per hour to find the water or steam consumption per hour. Not all of the steam is exhausted, however. Some of it stays in the cylinder and is compressed. This must be deducted, but in the same way, finding the volume and pressure at a certain point as before. This method, however, is not very accurate, for the valves or piston may leak, steam is condensed, or there is hot water in the steam, and these things the indicator does not show. They must be estimated and added to the total, as shown by the card. This loss varies with the load and pressure. A usual estimate is to add 25 per cent to what the indicator shows, but this will not do for all loads, for with the early cut offs the percentage of unindicated loss becomes greater. For a quarter cut-off, and a mean effective pressure of 42 pounds, the loss to be added is 25 per cent. For one-fifth cut-off the unindicated loss is 30 per cent; for one-seventh cut-off, 40 per cent; and one-tenth cut-off, 58 per cent. The percentage of loss becomes less with the longer cut-offs, being 21 per cent at three-tenths cut-off, and 13 per cent at one-half cut-off. Those losses must be added to what the indicator shows, and the result will be fairly satisfactory for an engine in fair condition, not leaking badly. Another way of conducting this test is to watch the water-guage glass, mark it, and note how long it takes to lower the water to a certain distance, all the steam being meanwhile used in the engine, from which indicator cards are being taken at intervals. From this test the volume of water used by the engine in a certain time can be figured from known dimensions of the boilers, and divided by the horse power and the time. A comparison of this with the consumption indicated by the indicator would be of interest. The most accurate way would be to weigh all the water that was pumped into the boiler and deduct that carried over as moisture, and charge it to the engine. The only proper way to do this is to have tanks, feed into tanks, weigh the water and pump the water into the boiler, keeping account of the water weighed, and leaving the water the same height at the end of the test that it was before. Cards taken meanwhile would show the horse power, and from these two factors the water per horse power is easily found. A fair approximation can be found by making careful tests of how much water each stroke of the pump will take, averaging these, and putting on a counter to count the strokes. Knowing how many pounds of water the pump will force at a stroke, it would be quite simple to find the total pounds pumped for a certain number of strokes.

COAL THROUGH A PIPE LINE.—The H. C. Frick Coke Company recently made a test of transporting coal by means of pipe lines. The coal was ground to a powder at the Standard crusher and transported from there to the Valley works. It was then mixed with an equal amount of water and pumped through a two-inch pipe a distance of 1300 feet to a tank at an elevation of 40 feet. From there the coal dust was charged into an oven and the test made. The experiments are said to have shown that coal can be transported in liquid form, but whether it can be done profitably or not remains to be seen. Mr. H. C. Frick expresses the opinion that this means of transporting coal is practical and will in time be used. There are one or two things yet to be overcome. The trouble is that whenever the pumps are stopped, the crushed coal will clog in the pipes and serious trouble will follow. Something will sometimes happen to the pumps or the machinery, and the mixture being forced through the pipes, will clog. Another question is the cost. The experiments made show that the cost of transporting coal by means of pipes is greater than the present and ordinary way. This may be remedied as was the transportation of oil through pipes, which a few years ago was not thought possible or practicable. American Manufacturer.

Automatic Machinery.

There seems to be a craze for automatic machinery at this time. Some of the enterprises remind me of the old farmer who invented and patented a torch, which was lighted at the open fireplace, and then used to light the candle. No one but the inventor could see why this was better than to light the candle directly at the fire. People seem to get into "automatic" ruts. It does not necessarily follow that because work is done on an automatic machine, that the net work is less than by some other method. This idea is hard for many people to understand, as it is quite natural to assume, on general principles, that the automatic work is always cheapest. There seems to be more men at present competent to design nicely working automatic machinery than to use good judgment in deciding when it is and when it is not well for automatic machinery to be used. It is quite possible for this class of machinery to be just what is needed for a certain shop, and the worst possible thing for another shop, even on the same kind of work.

In the manufacture of milled machine screws, it has been pretty well demonstrated that it does not pay to slot the screws automatically, or, more particularly, not to slot them on the same machine that turns them and cuts the thread. In the first case, a boy can slot a thousand screws in a day on a simple fixture costing not over $10; secondly, the interest on the difference between the cost of a plain automatic machine to turn (mill) and thread screws, and a complicated one to slot them also, will nearly, if not quite, in itself, pay for the hand work work of slotting, to say nothing of the time lost, and the expense made by periodical overhaulings of the complicated machine in the repair shop. Again, the machine that makes and slots the screws is good for screws, while the simple machine may be used to turn almost anything within the limit of its size. Machinery for setting and distributing type is also a good example of this idea; a machine for setting and distributing only, is a comparatively simple one, and can be built at a comparatively low price, but when the little odd jobs of hoy's work are included in the operation of the machine, it seems to many people who are competent to judge, that "it does not pay for the powder." The complication increases in a compound ratio with every additional duty put upon the machine. The fact that a machine will do everything does not in itself make the machine valuable—except, perhaps, to the man who is selling the stock. Complicated machinery for automatically tapping nuts is of the same class, because the cost of the work they are intended to save is so very low in the first place that it is almost impossible to make a saving that will pay the interest on the cost of the machinery.

I remember one concern that bought an automatic machine for making small rings. The machine would make enough in one day to last them a year, but it wouldn't make anything but rings. One-tenth of the cost of the machine would have supplied them with rings for all the time they could possibly be in business, but they never could understand why they didn't get the rings cheap, because the machine made such a large number in a day. Certain dealers in clothing always claim to sell below cost, but make money because they do a large business. In mechanical matters, loss cannot be multiplied by anything that will make it a profit, because mechanics deal with facts. It seems safe to say, in a general way, that, in the present state of the art, a complicated and expensive automatic machine, to perform a simple and cheap operation, is not a good investment.—W. L. Cheeney in the Engineer.

THE soldering of aluminum, which has long been a difficult problem, has been recently solved. By sprinkling the surfaces to be soldered with chloride of silver, and melting down, the soldering is effected simply and satisfactorily.

PACIFIC ROLLING MILL CO.,

.....MANUFACTURERS OF.....

Cast Steel Castings and Steel Forgings

UP TO 20,000 LBS. WEIGHT.

True to pattern and superior in strength, toughness and durability to Cast or Wrought Iron in any position or for any service.

GEARINGS, SHOES, DIES, CAMS, TAPPETS, PISTON-HEADS, RAILROAD and MACHINERY CASTINGS of Every Description.

—ALSO—

HOMOGENEOUS STEEL, SOFT and DUCTILE, SUPERIOR TO IRON FOR LOCOMOTIVE AND MARINE FORGINGS.

ALSO Steel Rods, from ¼ to 8 inch diameter and Flats from 1 to 8 inch. Angles, Tees, Channels and other shape Steel Wagon, Buggy, and Truck Tires, Plow Steel; Machinery and Special Shape Steel to size and lengths STEEL RAILS from 12 to 45 pounds per yard. ALSO, Railroad and Merchant Iron, Rolled Beams, Angle, Channel, and T Iron, Bridge and Machine Bolts, Lag Screws, Nuts, Washers, Ship and Boat Spikes; Steamboat Shafts, Cranks, Pistons, Connecting Rods, etc. Car and Locomotive Axles and Frames, and Iron Forgings of all kinds, Iron and Steel Bridge and Roof Work a Specialty.

HIGHEST PRICE PAID FOR SCRAP IRON AND STEEL.

☞ Orders will have prompt attention. Send for Catalogues. Address

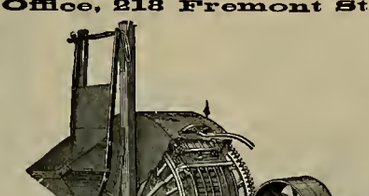
PACIFIC ROLLING MILL CO., 202 Market St., San Francisco.

FULTON IRON WORKS,

HINCKLEY, SPIERS & HAYES, Proprietors.

[ESTABLISHED IN 1855.]

Office, 218 Fremont St., San Francisco.



TUSTIN'S PULVERIZER.

—MANUFACTURERS OF—

MARINE ENGINES AND BOILERS.—Propeller Engines, either High Pressure or Compound, Stern or Side-wheel Engines.

MINING MACHINERY.—Hoisting Engines and Works, Cages, Ore Buckets, Ore Cars, Pumping Engines and Pumps, Water Buckets, Pump Columns, Air Compressors, Air Receivors, Air Pipes

MILL MACHINERY.—Batteries for Dry or Wet Crushing, Amalgamating Pans, Settlers, Furnaces, Retorts, Concentrators, Ore Feeders, Rock Breakers, Furnaces for Reducing Ores, Water Jackets, etc.

MISCELLANEOUS MACHINERY.—Flour Mill Machinery, Saw Mill Engines and Boilers, Dredging Machinery, Powder Mill Machinery, Water Wheels.

Tustin's Pulverizer

WORKS ORE WET OR DRY.

ENGINES AND BOILERS

OF ALL KINDS,

Either for use on Steamboats or for use on Land.

Water Pipe, Pump or Air Columns, Fish Tanks for Salmon Canneries

OF EVERY DESCRIPTION.

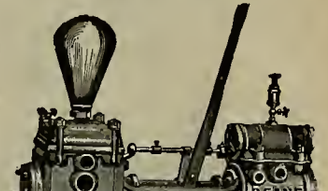
Boiler Repairs Promptly attended to and at very moderate rates.

AGENTS FOR THE PACIFIC COAST FOR THE

Deane Steam Pump.

SPECIALTIES:

Corliss Engines and Tustin Ore Pulverizers.



DEANE STEAM PUMP.

Agents and Manufacturers of the Llewellyn Feed Water Purifier and Heater.

THE GIANT POWDER COMPANY.

— PATENT OWNERS OF —

NOBEL'S DYNAMITE, NOBEL'S EXPLOSIVE GELATINE, NOBEL'S GELATINE-DYNAMITE, AND THE JUDSON IMPROVED POWDER.

Best and Strongest Explosives in the World.

JUDSON POWDER.

The only Reliable and Efficient Powder for Stump and Bank Blasting. Railroad Contractors and Farmer use no other. As others IMITATE our Giant Powder, so do they Judson, by manufacturing an inferior article.

BLACK POWDER.

The Giant Powder Co. having built Black Powder Works, with all the latest improvements, at Clipper Gap, Placer County, known as THE CLIPPER MILLS, offer this powder and guarantee it the best.

CAPS and FUSE at Lowest Rates.

THE GIANT POWDER COMPANY, 30 California St., San Francisco.

A New and Valuable American book for Prospectors and Miners.

JUST READY.

The Prospector's Field Book and Guide

In the Search for and the Easy Determination of Ores and other Useful Minerals. By Prof. H. S Osborn, LL D., author of "A Practical Manual of Minerals, Mines, and Mining." Illustrated by 44 engravings. 12mo, 175 pages.

Price $1 50, by mail, free of postage, to any address in the world.

CONTENTS —Chapter I. Preparatory Instruction. II. Crystallography. III. Surveying. IV. Analyses of Ores, Wet Method, Dry Assay of Ores V. Special Mineralogy, Gold. VI. Platinum, etc., silver. VII. Copper, and How Measured by Ores. VIII. Lead and Tin. IX. Zinc, Iron. X. Mercury. Bismuth, Nickle, and Cobalt. XI. Aluminum, Antimony, Manganese, and other Minerals. XII. Precious Stones. Appendix, Correction of Weights and Measures, Prospector's Pointers, Index.

BY THE SAME AUTHOR.

Recently Published.

A PRACTICAL MANUAL OF MINERALS, MINES AND MINING.

Comprising suggestions as to the localities and associations of all the Useful Minerals; full descriptions of the most effective methods of both the qualitative and quantitative analyses of each of these minerals, and hints upon the various operations of mining, including architecture and construction. By Prof. H. S. Osborn, LL. D. Illustrated by 171 engravings. 8vo. 367 pages

Price $4.50, by mail, free of postage to any address in the world.

☞ *Descriptive circulars giving the full tables of contents of the above books sent free to any one who will send his address.*

☞ *A New List of Leading Books on Metal Mining, Metallurgy, Mineralogy, Assaying, Chemical Analysis, Geology, etc., sent free to any one, in any part of the world, who will send his address.*

☞ *Our new and revised Catalogue of Practical and Scientific Books, 88 pages, 8vo, and our other Catalogues, the whole covering every branch of Science applied to the Arts, sent free and free of postage to any one in any part of the world who will furnish us with his address.*

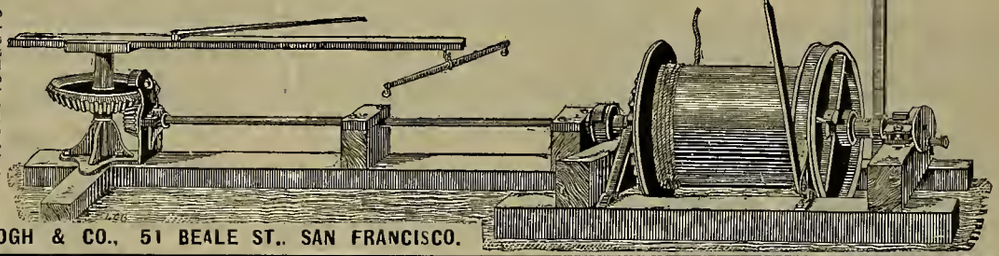
KROGH'S MINING HORSE-POWER HOIST

Is known to be the best Horse-Power Hoist now made. It is strong and durable. The drum will carry 1000 feet of five-eighths steel rope. It can be used to run a pump or blower in conjunction with hoisting.



Manufactured by

F. W. KROGH & CO., 51 BEALE ST., SAN FRANCISCO.

BALDWIN LOCOMOTIVE WORKS.

ANNUAL CAPACITY 1000. ESTABLISHED 1831.

LOCOMOTIVE ENGINES!

Adapted to every variety of service, and built accurately to standard gauge and templates. Like parts of different engines of same class perfectly interchangeable.

Broad and Narrow Gauge Locomotives, Mine Locomotives by Steam or Compressed Air, Plantation Locomotives, Noiseless Motors for Street Railways, Furnace Locomotives, etc.

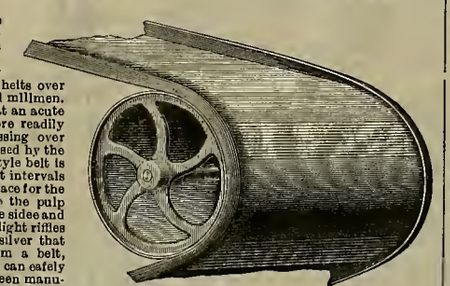
COMPOUND LOCOMOTIVES

BURNHAM, WILLIAMS & CO., Proprietors, Philadelphia, Pa.

THE BLASDEL CONCENTRATING BELT COMPANY.

We have now made arrangements to have our new Improved Concentrating Belt manufactured in San Francisco. We keep always on hand Belts suitable for the Triumph and Frue machines, but can make any length or width desired. The advantages of these belts over *any others* will be readily seen by practical millmen.

First, the flanges or edges of our belt stand at an acute angle inclining toward the center, and therefore readily conform to the change of direction while passing over the end rollers; thus the vexation and loss caused by the frequent breaking of the flanges of the old style belt is practically done away with. Again, our belts, at intervals of two to four feet, have a very slight riffled surface for the space of three inches, which tends to equalize the pulp on the belt, and prevents it from banking on the sides and forming channels through the center. These slight riffles also save very fine sulphurets and the quicksilver that would otherwise escape with the tailings from a belt, the surface of which is entirely smooth. We can safely say that it is a better belt than has ever been manufactured for use on this coast. It will last much longer and will handle fully one-third more pulp than any smooth belt, and will save a higher percentage of sulphurets



H. G. BLASDEL, Jr., Manager, 419 California St., San Francisco.

SCIENTIFIC PROGRESS.

Golden Trout.

Three specimens of trout caught in Mount Whitney creek, on Mount Whitney, by Mr. Harvey of Lone Pine, Inyo couoty, Cal., and by him given to Hon. Geo. S. Mills, Fish Commissioner of Nevada, who in turn sent them to William H. Sharkley, were sent to Dr. David S. Jordan, President of Leland Stanford Jr. University, with the request that he classify them. Tbe following is what Mr. Jordan has to say of tbem:

"They are the famous golden trout of Mt. Wbitney aod the Upper Kern river, which has attracted the attention of anglers for some little time, but which has not yet, so far as I know, received any adequate notice in print.

"The trout were first brought to my notice hy Lieutenant Wheeler's geological survey, which brought me specimens in 1877. Tbese were not in very good conditioo. I regarded them as of the same kind as the the trout in the headwaters of the Colorado, at the same time calling attention to the remarkable distribution of species on both sides of the desert and the mountaios. Later on I received other small specimens, hut still in such poor condition that I could do nothing more with them. The three received were in perfect condition, and I have had a colored painting made of them. The fish is really a distinct species of trout, entirely different from any found elsewhere either in the Rocky mountains or Sierra Nevadas. The very small size of its scales, the lack of teetb on the hyoid hones, and the peculiar color markings, are all distinctive of this trout, which will in time receive a name of its own.

"It seems evident, so far as one can judge of such matters, that this trout is descended from tbe trout of Western Colorado, which abound in the trihutaries of Clear river, the Green river and the Grand river and in the Gunnison district. But in being separated from these trout it has undergone a coosiderable change, and one would think this separation must have occurred hefore the Sierra Nevadas were elevated. It has already been claimed hy geologists that the Kern valley, altbough on the California side of the Sierra, is geologically a part of the Great Basin. Its trout, at any rate, are wholly different from the rainhow trout of California."

Adherent Lead Coating for Steel Plates.

English newspapers report the result of a new process of coating iron and steel plates with lead, wbich promises to have an important bearing upoo industries in which terne plates and galvanized plates are sometimes used. Following is a description of the process: Tbe plates or other articles to be coated are first pickled in bath to remove scale. Through this hath a weak current of electricity is passed, which is said to reduce tbe time required by one-third. From this bath the articles are passed as usual into anotber of lime water, which neutralizes the acid, and thence into a tbird of clear water. They are then immersed in a fourth bath consisting of a neutral solution of zinc and stannic chlorides, obtained hy dissolving granulated zinc and tin in hydrochloric acid. From this bath they are passed into a drying chamber heated by steam, where the moisture on them from tbe last bath is evaporated, leaving behind a deposit of the mixed metallic chlorides, which protects the plates, etc., from oxidation. When dried, these plates are ready to be passed into a bath of molten lead.

On issuing from the batb, tbe plates are found to be coated witb a uniform and very adherent layer of lead. Though perfectly uniform, this layer is nevertheless very thin. The ductility and strength of the iron are not decreased by the process, and a plate can be bent aod closed, and again opened out, without breaking the coatiog. In the case of galvanized iron, hending the plate to a sharp angle causes the coating to crack. At the works there are shown specimens of water pipes coated completely inside and out with lead. One of the pipes was a riveted steel pipe about nine ioches in diameter. For such purposes tbe process seems peculiarly advantageous, as it not only preserves tbe metal, but allows calking to be entirely dispensed with. Samples of sbip plates have also heen coated and the riveting afterward done in the usual way without breakiog the coating, which we may also remark, takes paint very well. The thinness of the coat is remarkable, as two ounces per square foot of plate proves sufficient, whereas tbree ounces of spelter are in general required in galvanizing. The inventors claim that an additional economy will he effected by the fact that there is no precipitate or sediment deposit in their melting tanks, as occurs with zinc, while at the same time the molten lead has no effect on the material of which the bath is constructed, which may, therefore, last indefinitely.

REFRIGERATION BY CARBONIC ANHYDRIDE.—Refrigeration hy means of cold air appears likely to be superseded hy a system of refrigeration by carbonic anhydride, which a reporter of London *Iron* recently witnessed in operation at Messrs. J. & E. Hall's works at Dartford. This system was first hrought out in Germany, where its success led to Messrs. Hall introducing it into this country. The apparatus, which is very compact and small for its refrigerating power, consists of an evaporator, or coils within which the liquefied carhonic acid is caused to evaporate. It is then drawn into a compressor and raised to the liquefaction pressure; it then condenses into a liquid within the coils of a condenser, whence it flows into the evaporator, and so on in a closed cycle. Liquefied carhonic anhydride evaporates under atmospheric pressure at about 120° Fahr., helow zero. In the machine, however, it is evaporated at 0° Fahr. or—10° Fahr., according to the temperature it is required to produce, cooling the hrine surrounding the evaporator-coils to within a few degrees of itself. Tbe hrine thus cooled circulates in the freezing-rooms, chill-rooms, cold stores, or between the ice-moulds in ice-factories, and abstracts the heat from the water or goods to he frozen or chilled. These machines are said to effect the same work as the dry air refrigerator, on one-seventh the coal consumption, and with one-fifth the weight of macbinery. The system is without danger. Carhonic acid gas is used for making soda-water; it is inodorous and nonpoisonous, and the entire contents of a machine might be allowed to escape without causing inconvenience. The machine we inspected is capable of producing 24 tons of ice in 24 bours, or, if used for cooling, it is equivalent to the meltiog of 48 tons of ice io that time. It has been made to the order of Messrs. Nelson Brothers for their largest sheep-freezing establishment in New Zealand, at wbich they freeze over 2,000 sheep per day, and who ordered it after haviog bad evidence of its great coal economy.

VENETIAN GLASS.—Everyhody admires Venetian glass, the product of the Murano factories, hut few know "how it is done," and even those few do not know the real secret. The curious may stand hefore the furnace and watch the whole process from the time the first lump of glass is put into the white fire at tbe end of a long, hollow iron rod till tbe perfect vase is put into tbe oven to he slowly cooled, hut they will not see below the surface. The development of the vessel is before you. The secret of growth is hidden. Not even the proprietor of the establishment koows it. The mystery is io the keeping of two men, is handed down from generation to generation. The father shares it with his son or with his nearest male kin. The eldest always has one or two young memhers of his family near him as apprentices, who learn from him the process of manufacture and who may he considered "in the line of succession." In order to provide against a mischance the secret is written down and deposited in a lawyer's archives at Venice. When one of these two men dies the otber takes the paper, explains it to tbe nearest male relative and then locks it up again. The Veoetians of the middle ages invented the art and made it famous. During the tumult through which Venice passed the secret was lost, but ahout 70 years ago an Italian gentleman, who had pondered long on the mystery, chanced to hear of an old man who it was said had the secret. It was handed down to him from his father. It had survived in a family of peasants, who guarded it with a jealous care. Tbis old man was induced to try the process, and the result was the revival of Venetian glass. The old villager's family has been enriched, hut the men still remain simple workmen.—Boston Journal of Commerce.

IT is stated tbat the patents of Edison, Graham, Tainter, Bell and Chichester Bell for the phonograph and phonophone, embracing all the known methods of recording speech and other souods, have now been combioed, and that it is probable that in a short time tbis marvel of modern inveotive skill will be available for business purposes. Several of the men who have shown their enterprise hy takiog up the telephone when it was regarded with little else than polite curiosity, are now said to be interesting tbemselves in the introduction of the phonograph in Great Britain.

G. & E. PENNINGTON & SONS,

STEEL WORKS.

MANUFACTURERS OF

Best Refined Cast Tool Steel, Machinery and Hammer Steel,

Steel Piston Rods, Shear Blades, Lathe Spindles, and all kinds of Steel Forgings Made to Order.

REFINED BAR STEEL IN OCTAGON, ROUND, SQUARE OR FLAT, MADE IN SIZES AND LENGTHS TO ORDER.

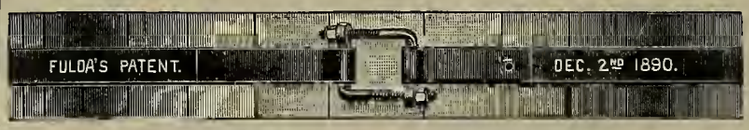
Miners' Drill Steel, Picks, Crowbars, Sledges, Hammers, Etc.

Chains all Sizes and Lengths Manufactured to Order. N. B.—Drill Steel, any Length from one to thirty feet.

OFFICE AND WORKS:

218 and 220 FOLSOM STREET, - - SAN FRANCISCO, CAL.

FULDA'S PATENT BAND AND HOOP COUPLING.



The Best, Simplest and Cheapest Coupling for Tank Hoops.
A sufficient lap of hoop renders it unnecessary to rivet the hoop. It will fit the circle of any tank, regardless of size.
Made in sizes to fit any width of iron
Prices, $1.00 to $1.50 per Pair. For sale to the trade. Liberal discount in quantities.

FULDA BROTHERS,

30 TO 40 SPEAR ST., SAN FRANCISCO,

MANUFACTURERS OF MINING AND WATER TANKS.

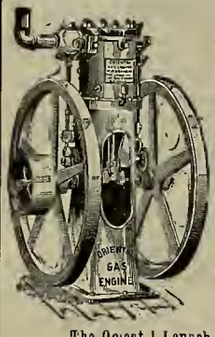
THE ORIENTAL GAS ENGINE



IS THE BEST, because it combines simplicity of construction with power and economy in space. It can be run with natural or manufactured gas or gasoline at a cost of 20 to 25 cents per horse power per day.

It can be used for pumping purposes, as well as for all purposes where a perfect engine is required, with the advantage of lessening the risk of explosions. No licensed engineer at a high salary needed to operate it.

Send for circulars and prices if a good safe engine is what you need.

The Oriental Launch is Perfection.

ELECTRICITY.

Water Power in Switzerland.

The utilization of water power for industrial purposes by means of electricity, an important achievement of the present day, is of extraordinary significance for the industries of Switzerland, a country placed in an unfavorable position, and in consequence of its lack of coal, is called upon to make a more complete use of its abundant water power.

Hitherto a practical outset in this direction has been made only at a few places in Switzerland. An extensive undertaking, which is only in its inital stage, is being made at the falls of the Aar at Wynau, and when completed will be of the greatest importance for an extensive district. Herr Bangerten, of Zangenthal, has studied the question closely, and has given in, to an assembly of parties interested, a thorough going report on the execution of such an undertaking.

Herr Bangerten shows that in Switzerland in the year 1891 there were altogether 2,359 mechanical establishments with a motive power of 54,243 horse power water, 27,432 steam, 394 gas and 332 electricity, or a total of 82,393 horse power, not including the thousands of horse power which do not come under the Factory Act. Two-thirds, therefore, of the power are furnished by water and one-third by steam, for producing which twenty-eight million francs are sent abroad for coal and eight million for petroleum. But according to the calculations of the engineer Lautenburg, of Berne, Switzerland has at its disposal more than 600,000 horse power of water power at present unemployed and easily available.

The territory of the Wynau water power, a concession of which has been granted by the goverments of Berne and Solothurn to Herr Muller-Landsmann, of Lotzwylly, extends for a length of 8,000 metres with a general fall of 9 metres. A weir is to be erected above Wynau, from which a canal 1,000 metres long branches off on the right bank of the Aar, at the lower end of which the turbines will be placed.

From the weir to the turbines there will be a fall of 2.20 metres, which can be increased to 2.70 metres by damming up the water at the sluices. The total average affiux of water is at least 75 cubic metres. The fall and the quantity of water yield, therefore, is at least 2,500 horse power which may be increased to 7,000 by suitable prolongation of the canal. The circle of parties interested, taking Wynau as a central point, has a radius of about 20 kilometres. The yearly cost of horse power will be from 160 to 190 francs. The concessionary, with certain reservations, has sold the whole to the Swiss Compressed Air and Electricity Company. The total outlay for erecting the works and bringing them into action will be from 2 to 2½ million francs. It is calculated that, *e. g.*, the chisel of a stonemason aided by compressed air will preform six times the work of a chisel used by hand alone.—Electrical Review, London.

Train Lighting by Electricity.

It is believed that Prof. J. F. McElroy, Superintendent of the State School for the Blind, at Lansing, Mich., has solved the problem of lighting a train by electricity in a successful and economical manner. The machine devised by him is a cylindrical dynamo, which is attached to the forward axle of the locomotive. No wire is used in the armature or in the part of the machine which conducts electricity to the lighting system after the parts have become sufficiently charged with the current. The armature of the new dynamo is fastened immovably to the axle, and this revolves in contact with the other parts of the dynamo, which rests upon roller bearings at the end of the cylinder. The entire machine does not weigh over 300 pounds, and is completely encased in an iron jacket, so that snow, rain, or dust cannot affect it.

It is said that it will run for weeks without any attention whatever, and all it requires is a little oil occasionally. The wires run under the engine and are connected to each car by means of couplers similar to the steam couplers now in use. The lights are incandescent, and each car can be illuminated to whatever extent is desired. There is a device to retain light in the cars at a standstill. In each car a small but powerful storage battery is placed. While the train is in motion these batteries become charged. When the train stops at a station the power from the dynamo ceases, but automatically the storage batteries come into play and light the train. A car may be cut off and thrown to a side track to await a connection, and the lights will be in service for six hours. The time can be increased at will by increasing the storage battery power. The headlight for the locomotive and every light in the train will be electric, and the tax on the power of the locomotive will be small.

The cost of the new system is less than the ordinary lights now in use on railroads. The dynamo is so arranged that it does not take the power from the locomotive when it is doing the heaviest work—that is, when it is starting. The work begins when the engine is moving at ahout 13 miles an hour. When the train is broken up, the whole apparatus is in a normal condition and requires no attention whatever.—Chicago Journal of Commerce.

USEFUL INFORMATION.

THE ANCIENT BLACKSMITH.—The blacksmith occupied an important position among the craftsmen of the Middle Ages. The insecurity of life and property, which was one of the chief grievances of the times, made strength of material indispensable, whether to guard the shrine of a saint or to protect, after a more homely fashion, the family chest or coffer. The strength and durability of iron led to its use for these defensive purposes from early times. Until coal came into general use, malleable iron was produced direct from the ore with charcoal fuel by continuous working. Sussex was from early times the chief seat of the iron industry. The earliest positive record of the trade there is contained in a grant made by King Henry III to the town of Lewes in 1266, by which the inhabitants were empowered to raise toll for the repair of the town walls after the battle. Every cart load of iron destined for sale, which came from the neighboring "weald," was to pay one penny toll, and every horse load of iron half that sum. In 1290 a sum of money was paid to a certain Master Henry of Lewes for the ironwork to the monument of Henry III in Westminster Abbey, which reminds us that talented smiths were brought often from long distances for important works.—Chambers Journal.

RUST FROM PLOWS.—An exchange gives a good recipe for removing rust from plows. Purchase a small quantity of sulphuric acid, which may be had from any drug store for a small sum. Pour five ounces of it into a pint of water, slowly and carefully so as not to come in contact with the hands or clothing, as it will eat into the flesh worse than fire. Apply this to the plow, or any other iron or steel implement to be cleaned, with a paint brush. As soon as one application of the acid is dry, apply another; usually three or four coats will be enough. Then wash off with clear water. If any spots remain, paint over these spots again and rub with brick dust. After the iron work is cleaned, paint it over with a little coal oil or linseed oil; this will keep it free from rust. Set the implement in a dry place and on a wooden floor. All implements, when kept free from rust and bright, will scour readily in the soil, will do better work, and with little extra force. A badly rusted plow is very worrying to work with, both to the team and plowman. The plow cannot be made to clean, causing frequent stoppages, and the furrow cannot be turned completely over, making very poor work.

VENTILATION.—Gas jets may be made important auxiliaries to ventilation. Inserted in the bottom of air shafts, they establish active currents which withdraw the ventilated air from living rooms. It has been proven by actual experiment that one cubic foot of illuminating gas can be so utilized as to cause the discharge of 1000 cubic feet of air; and as a common gas burner will consume from three to six feet of gas an hour, it will extract 1000 times that amount of air from a room each hour, if suitable contrivances are used, besides giving light. There is a chance for useful inventions based on this principle.

A NEW arrangement for the detection of fire damp consists in pumping air into a testing-room and testing it with a Bunsen burner. If the air contains a dangerous quantity of fire damp it ignites, and, moving a valve, sounds a gong of warning.

FLUIDS which do not adhere, or are not attracted upward by the sides of a vessel, sink around the brim and rise in the center. Thus mercury in a glass forms a convex surface, while water forms a concave.

TO STOP mouse holes, take a piece of common hard soap, stop the hole with it, and you will have no further trouble from that quarter. It is equally as effectual as regards rats, roaches and ants.

Educational.

JOHN T. EVANS,
Assay Office and Chemical Laboratory,
ROOMS 46 AND 47 MONTGOMERY BLOCK, 628 Montgomery Street, San Francisco. For nearly 15 years with Thomas Price, as Chief of the Ore-Assay and Analytical Department. Lessons given in Assaying and Chemistry.

School of Practical, Civil, Mechanical, Electrical and Mining Engineering,
Surveying, Architecture, Drawing and Assaying,

NOTICE TO GOLD MINERS!

SILVER-PLATED AMALGAMATED PLATES

For SAVING GOLD!

IN QUARTZ, GRAVEL, OR PLACER MINES. MADE OF BEST SOFT LAKE SUPERIOR COPPER

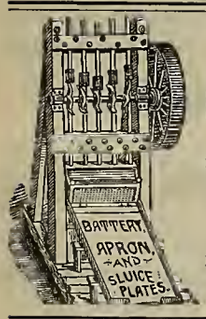
AT REDUCED PRICES.

Our plates are guaranteed, and by actnal experience are proved, the best in weight of Silver and durability. Old Mining Plates Replated, Bought, or Gold Separated. THOUSANDS OF ORDERS FILLED.

SAN FRANCISCO NOVELTY, GOLD, SILVER AND NICKEL PLATING WORKS,
68, 70 & 72 First St., San Francisco, Cal.

☞ SEND FOR CIRCULARS.

JUSTINIAN CAIRE, Agent,
521 & 523 Market St., San Francisco,
—DEALER IN—
Assayers' and Mining Material.
—MANUFACTURER OF—
BATTERY SCREENS AND WIRE CLOTH.
Agent for HOSKINS'
HYDRO-CARBON ASSAY FURNACES.



IMPORTANT TO GOLD MINERS!

SILVER-PLATED AMALGAM PLATES for SAVING GOLD

In Quartz, Gravel and Placer Mining.

PRICES GREATLY REDUCED ONLY REFINED SILVER AND BEST COPPER USED. OVER 3000 ORDERS FILLED. FIFTEEN MEDALS AWARDED. Old Mining Plates can be Replated. Old Plates Bought, or Gold Separated. These Plates can also be purchased of JOHN TAYLOR & CO., Corner First and Mission Streets, San Francisco.

SAN FRANCISCO GOLD, SILVER AND NICKEL PLATING WORKS,
E. G. DENNISTON, Proprietor. 653 & 655 MISSION ST., SAN FRANCISCO, CAL.

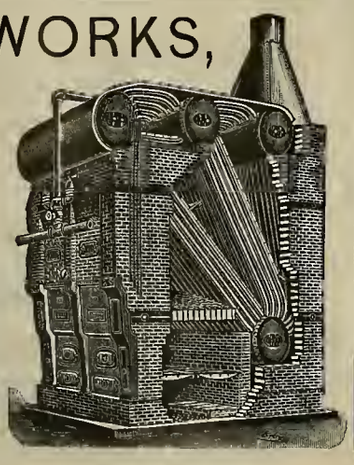
Our Plates have been used for 20 years. They have proved the best. We adhere strictly to contract in weight of Silver and Copper.
SEND FOR CIRCULAR.

RECEIVED EVERY MEDAL Awarded on the Pacific Coast for Silver-Plated Amalgam Plates and Best Gold, Silver and Nickel Plating.

ATLAS IRON WORKS,

POTRERO, SAN FRANCISCO, CAL.,
BUILDERS OF
Mill, Mining, Street Railway AND Dredging Machinery,
PACIFIC COAST AGENTS FOR THE
Sterling Water Tube Safety Boiler,

Safest, Most Economical and Durable Boiler in the Market, Specially Adapted to Mining Purposes — Being Easily Transported over Mountain Roads.



☞ SEND FOR PRICE LIST.

The Judson Dynamite and Powder Co.,

— MANUFACTURERS OF —

Dynamite and Blasting Powder,

18 CALIFORNIA STREET, SAN FRANCISCO.

Directors:

EGBERT JUDSON, ALVINZA HAYWARD, THOMAS BELL, JOHN S. DOE, ED. G. LUKENS (President.)

10-STAMP MILL
Complete with Power.
ALSO
2 Frue Concentrators,
For Sale at a Bargain.
CORONADO FOUNDRY & MACHINE CO.,
Coronado, Calif.

TUBBS CORDAGE CO.
(A Corporation.)

Constantly on hand a full assortment of Manila Rope, Sisal Rope, Duplex Rope, Tarred Manila Rope, Hay Rope, Whale Line, etc., etc.

Extra sizes and lengths made to order on short notice.

611 & 613 Front St., San Francisco, Cal.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned

CALIFORNIA.

Amador.

BAY STATE.—Amador *Ledger*, July 30: The developments during the past week at this mine have again raised tha hopes of the stock holders. After sinking 300 feet, drifts were run east and west in the expectation of tapping the ledge. After running beyond the distance that the ore-body was supposed to be, and encountering nothing of importance, the success of the undertaking looked very dubious. It was next decided to drift north and south along the lode line. In the course of a few feet in the south drift, a small ore-body was struck. It appeared in the shape of a wedge, and in a few feet widened out to twn feet of good-looking pay rock. It carries fine-looking sulphurets, and some pieces show free gold. Samples were left at the Kennedy office last Saturday, which Mr. Parks thought would assay as much as $50 per ton. W. T. Jones, the superintendent, informs us that the ledge has since wideued out to four feet, and that the ore is calculated to mill on an average at least $6 per ton. They have also struck the ledge in the north drift. The shaft appears to have been sunk on a barren spot, or fault in the ledge, and the experience serves to show how easy it is, even under the best management, to miss the ore-body. As a result of these flattering discoveries, the stock has stiffeued in price, and while shares might have been had a couple of weeks ago at a discount, none are offering now at par.

KENNEDY.—Tho new sulphurets works just put up at this mine are completed. They have a capacity of about three tons per day. A frame building is being erected over the ovens, and when this is completed—which will be this week—the ovens will be sufficiently dry for commencement of operations. It is expected to start roasting in a few days.

Butte.

BY AN ELECTRICAL PROCESS.—Oroville *Mercury*, July 28: For some time, negotiations have been pending for the purchase of the old Hewitt placer mine which adjoins Oroville on the east. It was worked formerly by the hydraulic process, but of late years has not been mined at all. It comprises about 100 acres, and is owned, one-third by F. H. Hewitt and two-thirds by Mrs. S. S. Low. Some months ago Samuel G. Hayward, a mining engineer of Denver, Colo., examined the property and became confident that he could mine it profitably by means of an electrical process of which he is the originator. The land was accordingly placed under bond for about $15,000, and he has interested a number of New York capitalists in the scheme. Attorney Sexton informs the Oroville *Mercury* that the deeds have been sent on for confirmation, and the sale will probably be consummated in a few days.

GRAVEL RANGE.—Oroville *Register*, July 28: J. L. Jones of Gravel Range was in town on Tuesday, and from him we picked up a few points connected with the mines of that locality. Gregory, Bracken & Doyle ran a tunnel, but failed to strike pay gravel; and it was thought they would have to run a second tunnel still lower, but by sinking about ten feet at the face of the present tunnel, they struck good gravel that will pay handsomely. Five or six men are employed in running the bedrock tunnel at Linsy Bar, and it will take a month or more to complete that work. It is thought when this is finished that excellent gravel will be found. D. K. Perkins is getting out good quartz from an upraise in his mine, and will soon begin hauling ore to his mill for crushing. Harris & Patterson are not low enough in their tunnel, and will sink to strike the gravel. At Murphy Hill, Mr. Harris has two shifts of men at work sinking for auriferous gravel. John Brandt, in the mine in which he and Messrs. Johnson, Wakefield and Murphy are interested, is in about 200 feet, and from the quantity of water at the face of the tunnel, it is thought that pay gravel will be struck within a few days. Nothing is being done at the Butte King. Half a dozen men are employed at the Good Enough mine, and the gravel is paying well.

QUARTZ.—E. W. Slater, who has charge of the R. C. mill near Brownsville, was in town on Tuesday, and from him we learn that the 20 stamps at that mill are pounding away steadily. The mill is run by a Pelton water wheel, and water is obteined from Dry creek. Sixteen men are kept at work, and arrangements have recently been made for sinking the shaft down 250 feet. It is now down about 100 feet. Plans are being perfected for working tha ore by the cyanide process. This is being very successful at a mill in Shasta county, and J. C. Campbell, the superintendent of the R. C. mine, was up recently to examine the plant and note the effects at the Shasta mill. While speaking of quartz, Mr. Slater informed us that a company had been organized with a capital of $25,000 to open and work the E. W. quartz ledge above Enterprise, and that work had already begun upon the mine. A new tunnel will be run a distance of 140 feet, and this will tap the lode at a depth of 200 feet from the surface. Work on the tunnel will be pushed as vigorously as possible before winter sets in. A good steam power mill is upon the property, so that as soon as the lode is tapped, crushing can be commenced.

Calaveras.

RAOPENING THA COFFAA MILL CLAIM.—Calaveras *Chronicle*, July 30: James and Frank Gleason arrived this week for the purposa of reopening what is known as the Coffee Mill gravel mine, about four miles south of here, near the Junction. A new incline tunnel will be run, work upon which is to commence at once. A steam hoist is to be put up, the machinery for which has arrived at Valley Spring and will be transported without delay.

Colusa.

CHROME IRON MINE.—Willows *Review*, July 30: A new industry has just been developed on the side of the mountain, about 14 miles north of Elk creek and near Newville. Mr. Weil, a capitalist, and Mr. Knight, a mining expert, have a large number of men working on the large chrome deposit discovered several years ago. A road was built to the mine shortly after its discovery, but it was in bad condition, and Wednesday morning 13 men were set to work to rebuild it and we understand 40 miners will commence digging and preparing the chrome for shipment to New York via San Francisco on steamers. The first lot will be shipped about August 15th. The headquarters of the company will be at Elk creek. Teams are now wanted to haul the ore down the mountain and from thence to Fruto, where it will be loaded on cars for San Francisco.

Humboldt.

OIL DEVELOPMENT.—*Western Watchman*, July 30: The boring for oil goes steadily on, both at East Branch and at Mattole. At the latter place everything that is being done in the way of improvement is done in the most thorough manner, indicating the most complete confidence on the part of the company in the success of the venture. At the Garberville or East Branch well they are certainly close to petroleum. Superintendent Gilfillan writes to secretary O'Neal that they are working in soft sand rock, with occasional strata of hard flint or quartz, the latter becoming less and less, and the sand rock becoming more porous, more strongly impregnated with petroleum. We examined some of the drillings at Mr. O'Neal's office, that were brought in by president Pine; they were very strongly impregnated with petroleum. Mr. Gilfillan has had several breaks recently, but has overcome all difficulties, and is in the best possible spirits over the gratifying indications. He stated that the gas is escaping in such quantities and so continuously, that he proposes to confine it and convey it to the engine for fuel purposes. He closes his letter by asking if there is any more stock which he and the men of the creek can take up. At last report the depth was 1290 feet. President Pine showed the drillings he had to superintendent Burrows of the Mattole or Buckeye well, and that gentleman claimed that no better indications could be asked for.

Monterey.

THE PAJARO.—Monterey *Enterprise*, July 30: The machinery in the mill of the Pajaro M. Co. is not, as yet, in running order. Superintendent Waggoner expected to have the mill in operation last week, but a delay was occasioned by the displacement of the dynamo which proved too weak to do the work. It will be about two weeks before the company proceeds to separate the ore.

Nevada.

TO COMMENCE WORK.—Nevada City *Herald*, July 30: The Western Star M. Co. has levied assessment No. 1 of two cents per share, and will commence active operations on its property at once. It will push the tunnel in over 100 feet on the present ledge, which assays $30 per ton. The company feels encouraged over its prospects, and shows the same energy and push which have made the Champion what it is.

GOOD ORE.—Grass Valley *Telegraph*, July 30: This afternoon Mr. Goldstone brought to town some very good ore from the Jack Rabbit mine. The Jack Rabbit is situated ont near Buena Vista and many hundreds of dollars have been taken from the bedrock tunnels, below what is now the quartz vein. The ore shown in town to-day came from the level 300 feet below the surface. Everything in the mine is in a prosperous condition.

A GOOD FIND.—Grass Valley *Telegraph*, July 27: The Mount George mine on Rush creek, owned by Dr. W. C. Jones and others, is showing something new and is proving the truth of what is said in the bible book of Job—that "gold is where they fine (find) it." An ocherous small ledge has been struck that is literally filled with small scales of gold, and the gold falls ont as the rock is broken. This curious find was made while running to cut the main ledge. It is hoped that there is lots of that ocherous gold-bearing rock in the ground there.

MINE STARTED.—To-day the Sanvee M. Co. began work on its mine, with Mr. Frank Dunmaine in charge. The Sanvee ground has heretofore been known as the Golden Treasure, but will hereafter be called the Sauvee mine, worked by the Sauvee M Co. There will be three shifts run with two men to the shift, and counting miners and all there will be for the present about nine men employed by the company. The parties who are operating the mine are very wealthy wholesale druggists from Minneapolis. As soon as the ledge is struck, they intend erecting a ten-stamp mill with all modern improvements.

AAOUNN NEVADA CITY.—*Transcript*, Aug. 1: Last week Willis Silva, who lives out on Park avenue, at the edge of Little Deer creek, took a notion that he would put in a few sluice boxes in his back yard and wash some of the gravel which was exposed to view. He was of the opinion that the gravel would pay a few days' good wages, and he went to shoveling the gravel into the boxes and turned the water from the creek into the sluices. He worked at this for about a couple of days and then started in to clean-up, when, to his astonishment, he not only found some fine gold contained therein, but lying carelessly in the last sluice was a gold nugget as big as a hen's egg. He brought it to town and found that it contained over $300. The finding of that specimen is going to lead to the opening up of the extensive gravel deposits which lie in that part of the city. Several tributers have for some little time been working at the Gold Tunnel mine on Deer creek. They are working on a fine looking ledge. Last week they had a crushing of 16 tons at the Nevada County mill. To their surprise the rock yielded $60 to the ton, or nearly $1000 for the lot. They will go ahead now and get out a big crushing. Dan Gillette and two or three other miners, who have been prospecting a ledge in Meachem's place on Piety Hill, have struck a fine body of ore, some of which will go as high as $500 per ton. Work will be rushed and the mine will be fully developed. At the East Harmony the outlook is very fair. Yesterday two mules, which were purchased at Smartsville, were brought to this city, and now their home will be in the depths of this mine, where they will be employed in hauling the cars containing the rich gravel to the stations, to be hoisted to the surface. The Nevada City mine is looking better than at any time yet. There is plenty of rock in sight, and some of it is of very high grade. That mine is a bonanza. The reports from the Federal Loan continue to be of a very favorable character. It will not be long before the stockholders will be receiving dividends. The West Harmony gives promise of being the biggest gravel mine in the State. The company have been to an immense expense in putting in machinery, in order that the property may be worked in a systematic manner. There is an immense body of gravel opened up and good judges estimate that it will pay from $20 to $30 per ton. If this proves to be the case it surely will be the richest development ever made in this part of the country. The more prospecting that is being done in this district the more it becomes a self-evident fact that there is no better field for prospecting on the Pacific coast than in and around Nevada City.

Placer.

SALSIG.—Placer *Republican*, July 30: The vein east of the Salsig mine, formerly opened by Smith and others, has been sold lately to G. F. Deetken, the mining engineer. It will be opened out by him in the near future. The concentrates, mostly iron and copper pyrites, contained in the rock of this mine show a handsome assay of gold. It is also reported that work will shortly be resumed on the Salsig mine. With improved and cheapened methods of exploitation and milling, a good property is confidently expected to be developed by the owners.

Siskiyou.

QUARTZ AND GRAVEL.—Yreka *Journal* Aug. 1: James Brown has been taking out exceedingly rich quartz from his ledge at Ash Creek, on the Klamath river, which district contains several rich ledges, with good placer mining in the gulches and in Klamath river. Rummell & Co, working a river claim in the Klamath, near Ash Creek, are taking out good pay from the surface gravel in sinking down, which indicates that they will strike exceedingly rich pay at bedrock. It is not expected in river mining to realize any pay of consequence until near bedrock, hence this company is likely to make a big haul when nearing the bed of the old channel. A Medford Co., in the same locality, is also realizing good prospects, with certainty of a big strike on reaching bedrock. Burlison & Co., in the same district, have also been getting fine prospects, and taking out considerable gold dust, with expectation of doing still better before the season closes. The old Capt. Pope mine, Anderson mine, and other river claims between Shasta river and Henley, are also turning out well, to make the Upper Klamath one of the best mining districts in Siskiyon.

HUMBUG MINES.—This has been a prosperous year for Humbug, and the season only half gone. J. F. Boyle's mine has a full force of men working in it day and night to keep both mills running, and they are getting out some rich rock. The Spencer mine has a big force of men taking out some good ore to keep McCook's mill going, with teams hauling every day. Nelson has just completed his new house on his mine just across from the Spencer mine, and has started to work in his shaft. He has a fine prospect, and expects to lay out $8000 or $10,000 on his claim this season. The men employed are down some 30 to 35 feet and have a three-foot vein. Humphrey & Jesseman have struck a good prospect, and intend putting up an arrastre this fall on their mine. They have crushed ten tons that realized 20 ounces, and their ledge is 14 to 16 inches wide. Cartright & Phillips are running their air tunnel, which is in about 160 feet, and have 100 feet further to go before striking the other tunnel. This is one of the best mines in the country to-day, with $40,000 to $50,000 in sight. They are down 300 feet on their ledge, with a vein that will average two feet. They intend to put up a mill as soon as the tunnel is completed. Morrison & Lash are cleaning up, with plenty of water. They are about half done and are doing well. Hegler & Co. are crushing every day, and will start on their other tunnel right away to tap a body of ore above the upper level which prospects well. Humbug is the best camp in the county to-day, with plenty of work, good wages, and a good place to prospect.

Yuba.

A BROWN'S VALLEY BLAZE.—Marysville *Democrat*, July 30: A fire occurred at the works of the Jefferson Gold M. Co., at Brown's valley, shortly before midnight last night. The house built over the hoisting works and shaft was burned, and the machinery considerably damaged. The mine is owned principally by Marysville men, though one or two of the stockholders reside in Sacramento. F. W. Johnson and George W. Harney are principal owners and managers of the works, and they state the loss at $3000, with an insurance of only $900.

NEVADA.

Tuscarora District.

NAVAJO.—*Times-Review*, July 29: The stopes above the 350-level are yielding about the same as at last report.

BELLE ISLE.—West intermediate crosscut above the 350-foot level, extended 5 feet, cutting the vein again and a raise started on it, progress 3 feet.

NORTH BELLA ISLE.—No. 2 upraise, south 500-foot level, extended 19 feet, the vein shows no change. The stopes are looking about the same as at last report.

COMMONWEALTH.—East drift from No. 5 chute advanced 20 feet. face is in ore assaying $22.62 per ton. No. 1 raise, third level, has been put up 15 feet, should reach the ore in about 10 feet further. Commence extracting ore Monday the 1st.

NEVADA QUEEN.—North intermediate drift from No. 7 chute advanced 11 feet, showing bunches of ore. North drift from No. 6 advanced 15 feet, 2 feet of $50 ore in face of drift. North drift from No. 5 extended 18 feet, nothing of value in the face. West drift from No. 1 advanced 22 feet in second-class ore. Stopes continue about the same. 68 61 tons of first-class ore worked at Union mill, battery assay $272 per ton, and 248.6 tons sent to concentrating plant, battery assay $24.62 per ton.

Washoe District.

CON. CAL. AND VA. MINE.—Virginia *Chronicle*, July 30: 1500 level—From the south drift at point of connection with the old stopes we continue to extract some ore and fillings of average milling value. From the upraise which was carried up from the end of the crosscut run west 36 feet in from the main south drift, 155 feet south from the shaft station, we have continued to work upward and to extract ore of fair quality. 1650 level—Continued to extract some ore from the drift run east from the winze No. 3 (down 73 feet) in working upward from that point. Also some ore from the old stopes at the north end of the California ground. 1750 level—In east crosscuts Nos. 1, 3 and 5 from the main south drift, in working upward from the sill floor, have continued to continued to extract some milling ore. From the end of the drift run south, 88 feet from the end of the crosscut run west from the end of the south west drift, an upraise has been carried up 53 feet in a porphyry formation carrying streaks of quartz of low assay value. There have been extracted from all parts of the mine during the week 1008 1460-2000 tons of ore which was shipped to the Morgan mill, the average valne of which, per car samples, was $26.82 per ton. The average assay value of all the ore worked at that mill during the week, 980 tons, was $25.05 per ton, per battery samples. Bullion shipped to Carson Mint, assay value $26 531.90. Bullion on hand in our assay office, assay value about $14.700.

OPHIR.—1465 level—From the south drift, 101 feet below the sill floor of the 1465 level, at a point 84 feet in from its mouth, the west crosscut has been advanced 22 feet; total length 68 feet, continuing in quartz formation which carries a very low assay valne.

MEXICAN.—On the 1465 level the drift running north from the crosscut run east from the bottom of the winze sunk 101 feet feet below the sill floor of this level neer the south boundary of the mine, at a point 40 feet east from the winze, has been advanced 18 feet; total length 189 feet; in porphyry showing clay separations.

UNION CON.—900 level—The joint Union Con. and Sierra Nevada west drift has been extended during the week 25 feet; total length west from the joint shaft 2252 feet; the face is in porphyry and streaks of clay and quartz.

UTAH.—340 level—From the end of the north drift (at a point 432 feet in) from the west crosscut from the shaft station, west crosscut No. 2 has been extended 47 feet; total length 92 feet; continuing in porphyry and clay formetion, showing fine lines of quartz.

SIERRA NEVADA.—The east crosscut No. 2, 200 feet south of No. 1, 100 feet in Kenosha tunnel, has been advanced 35 feet; face in porphyry and streaks of quartz. The joint Sierra Nevada and Union west drift, 900 level, is in west of shaft of 2252 feet; face in porphyry and small streaks of clay and quartz.

ANDES.—East crosscut No. 1 north on 420 level, advanced 8 feet; formation qnartz and porphyry. Repair work was done in north drift.

GOULD & CURRY.—200 level—Northwest drift, started 435 feet west of shaft, has been extended 14 feet through porphyry; total length 438 feet.

BAST & BALCHER.—900 level—During the past week west crosscut No. 1 has been advanced 11 feet through hard porphyry and stringers of quartz; total length 406 feet.

HALE & NORCROSS.—1800 level—The north drift started from station was advanced 35 feet; total length 35 feet; face in porphyry. The south drift on this level was advanced 30 feet; total length 30 feet; face in porphyry. These drifts are outside of and east of the ledge.

POTOSI.—Have completed timbering the station at top of Potosi winze, 900 level, and put the new hoisting gear in place. Are running an east crosscut 40 feet north of Potosi winze, 1100 level; face in porphyry and streaks of quartz. Extracted and sent to the mill in the past week 437 900-2000 tons of ore from the 1100, 1150 and 1200 levels. Milled during the week 473 tons. On hand at mill 107, 1500-2000 tons; average battery assay $21.39; averega car sample assays $27 09. Shipped to Carson Mint 452 pounds of crude bullion.

WARD COMBINATION SHAFT.—The joint Alpha and Exchequer south drift from the north line of Exchequer 1800 level of Ward shaft, has a total length of 314 feet; face in cley and porphyry.

BULLION.—Have completed timbering the station at top of Potosi and Bullion joint winze, 906 level, and put the new hoisting gear in

place. The 1500 east crosscut, 300 feet south of north line, is in 75 feet; face in porphyry. The joint northeast drift from the 1800 station, Ward shaft, has a total length of 314 feet; face in hard porphyry.

ALPHA.—The joint Exchequer and Alpha south drift from north line of Exchequer, 1800 level of Ward shaft, has a total length of 314 feet; face in quartz, clay and porphyry.

EXCHEQUER.—The joint Exchequer and Alpha south drift from north line of the Exchequer, 1800 level of Ward shaft, has a total length of 314 feet; face in quartz, clay and porphyry.

OCCIDENTAL.—From the stopes on 350, 400 and 450 levels, have extracted and milled 175 tons of ore of the average assay value of $22.35 per ton as per battery samples. West crosscut No. 4, on the 750 level, has been extended 8 feet; in hard vein porphyry. East crosscut from Zadig shaft, Sutro tunnel level, has been advanced 22 feet in favorable-looking vein matter.

CON. NEW YORK.—The winze in No. 4 west crosscut, 650 level, is down on the slope 48 feet, following a streak of fair-grade ore.

SILVER HILL.—The raise in the south drift, 800 feet from the Justice shaft, 490 level, has been connected with the northwest drift on the 600 level.

CHOLLAR.—Are making repairs on the 450 and 650 levels. The east crosscut near the north line, 900 level, is in 69 feet; face in soft porphyry.

Ferguson District.

PROCESSINO.—Pioche *Record*, July 28: Mr. Hutchinson came up from Ferguson last night and reports things progressing favorably in the Magnolia. He will probably return there in a day or two, accompanied by Messrs. Eames and Sevenoaks, both of whom are now interested in the property. Preparations are being made to do a large amount of development work. The present shaft is being widened and timbered from top to bottom, and sinking will be commenced in a day or two. A contract has also been let on the crosscut tunnel on the north side of the hill. It is expected the vein will be cut inside of 50 feet. The tunnel has already been driven about 30 feet by the old owners. George Petty returned from Ferguson district Tuesday with samples from a 20-foot ledge which he has been prospecting for some time. The samples brought in assay $800 in silver and eight ounces or about $160 in gold. The ledge is a very promising one, and work will be prosecuted with vigor as soon as the heat moderates.

ARIZONA.

GOLD CAMP.—Tombstone *Prospector*, July 26: There is quite a stir at Gold camp. The English mine continues to improve with depth. The shaft is down 70 feet in two feet of $50 free milling ore. Steps are being taken to erect five stamps at the mine. A. Bauer and John Pierce have a claim in the Golden Rule district that is producing an abundance of very rich carbonate ore. The rich strike near the State of Maine, which is the property of Ingram and Fitts, continues to show up ore of marvelous richness. The ten stamps at Soldier Holes are pounding steadily away on Silver Bill ore. About 35 tons per 24 hours is reduced, and there is no doubt but that, with additional pans and concentrator, between 50 and 60 tons can be easily passed through every 24 hours during the month. The T. M. & M. Co.'s properties continue to produce the same heavy shipment of ore. There has been no change in the water since our last report. It is expected that the Old Guard will start next month. The last of the judgment indebtedness was paid off on Friday last, and the property is clear of all incumbrances.

AT TOMBSTONE.—*Prospector*, July 30: J. J. McClelland, who is at present in Louisville, Kentucky, is forming a substantial company to work the claims owned by him and A. Y. Young, near the lime kilns, about two miles northeast of town. Some very rich float has been found in that vicinity, and a large amount of development work has been done. Stringers of ore have been found, but it is only with depth that the large bodies of ore which run there can be tapped. The mineral belt, upon which are located the big bonanzas of the camp, will be found there, with development work sufficient to go 300 feet. One of the coming bonanzas of the camp is a three-cornered piece of ground upon which Jim Young found a piece of ore in place about two months ago. He let Chas. Smith into it and a shaft was started. It is down 35 feet, and is one of the most flattering prospects in the camp. Some of the ore is very rich and many sacks of first-class ore will go 500 ounces. About five tons of ore are already sacked ready for shipment, and this was taken out in sinking the shaft. The claim is located within a stone's throw of the courthouse. The slag dump at the Charleston smelter will be cleaned up to-day, and work upon it will have been completed. It has kept on an average of 20 men employed for 18 months, and has yielded a handsome sum to the company. There is some talk of taking down the big stamp mill at Charleston, which will save the heavy expense of a watchman, insurance and taxes. The company also have a fine smelting plant there. Only good reports come from the T. M. & M. properties and the Turquoise and Soldier Holes. The Fitts and Ingram mine, near the Maine, is showing better than ever; chloriders on Col. Herring's mine, in the same vicinity, are well satisfied, and, taken on the whole, the outlook is more than encouraging.

AZTEC.—Prescott *Courier*, July 26: Gov. Tritle has given the *Courier* some very nice looking specimens taken from the prehistoric shaft recently found by him on the Hassayampa. He calls the new, or rather the old, find the Aztec; says the vein is five feet in width, ore goes 60 per cent lead, $26 silver and $12 gold; ledge can be plainly traced along the top of the ground 450 feet north from the Hassayampa. Mr. Austin, representing the London Limited Pyritic Smelting Co., who went out to look at the Blue Dick, also examined the Aztec and its ore; said the component parts of the ore were just what his company wanted, taken in connection with other ores in the district, and he expected to make a favorable report to his company, which, he thinks, will put up at that point a 50-ton smelter, the capacity of which can be increased from time to time as the output of ore justifies. Mr. Austin has examined the neighboring properties, and is convinced that his company can treat any of the ores he has seen, at a cost not to exceed $15 per ton.

OREGON.

THE ROBBINS-ELKHORN.—*Bedrock Democrat*, July 30: Supt. J. H. Robbins, of the Robbins-Elkhorn, was in the city yesterday and to a reporter stated that everything is running smoothly at the mine, and that from this time on the company will ship two carloads, or 40 tons of concentrates per week to the Tacoma smelter. While this is a very expensive mode of handling the concentrates, yet the company realizes handsome profits. It costs $1.25 per ton to transport the concentrates from the mill to the city, and the railroad company charges $12 per ton from Baker City to Tacoma. Supt. Robbins says that the regular rate should be $9 per ton, and he expects soon to receive the reduction. The cost of reduction is $11 per ton, making the total expense $24.50 per ton. The smelting company allows 15 cents a unit for all iron in excess of silica, and as the Robbins-Elkhorn concentrates go 38 per cent in iron and 8 per cent in silica, the company receives a neat reduction, amounting to $4.50 per ton and reducing the cost to $20 per ton. Mr. Robbins will make his regular monthly clean-up on the 1st, and he says the output will be up to the usual good standard.

SPAETA.—The Golden Gate Mining Co. is pushing development work on its mine, which is the most promising free gold property in the State. A large force of miners is working for the Eastern Oregon Gold M. Co. of Detroit, Mich., on the Marotte property situated at the foot of Old Baldy mountain. The mines are showing up well, and it is certain now that a large milling plant, complete in every particular, will soon be erected here, to be operated strictly as a custom mill. This is what is needed, and this will pay the promoters of the enterprise at least 25 per cent annually on their investment.

WASHINGTON.

NEW MINING DISTRICT.—Okanogan *Outlook*, July 27: The miners and prospectors of Bridge creek and tributary mining camps held a meeting and passed resolutions for the organization of a new mining district, the boundaries of which are as follows: Beginning at the month of Agness creek and running westerly along the summit of the divide between Agness creek and the waters of the Stehekin river to the summit of the Cascade mountains, thence northerly along the summit of the Cascade range to the point where the divide between the Methow and Bridge creek joine the main range, thence southerly along the divide that separates the waters of the Methow river from those of the Stehekin system to a point opposite the mouth of Agness creek. Within the boundaries of this district are situated the camps of Bridge creek, Park creek, Horse Shoe basin, Little lake and north fork Bridge creek. The records of the district will be kept at the office of Wilkeson and La Due, near the mouth of Bridge creek.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR WEEK ENDING JULY 26, 1892.

479,612. — WEEN CUTTER — G. S. Andrews, Walla Walla, Wash.

479,545.—FOLDING CRATE—C. F. Baxter, Manrietta, Cal.

479,490.—KETTLE COVER—N. Crosman, Seattle, Wash.

479 496.—APPARATUS FOR REDUCING BITUMINOUS ROCK—A. Ford, Golden Gate, Cal.

479,644.—STRAW FUEL FEEDING APPARATUS—B. Jackson, San Francisco.

479,650.—FRUIT PACKEE—A. J. Longnecker, Elk Grove, Cal.

479,521.—SPIRIT LEVEL—E. McCullough, San Francisco.

479 716.—LABEL HOLDEE—C. W. Miller, Clifton, A. T.

479 444.—MINER'S TOOL—N. W. Moodey, Fresno, Cal.

479,570.—MOTOR—R. F. Nichols, Sr., Alturas, Cal.

479,531.—ANNING MACHINE—R. S. Robertson, Artondale, Wash.

The following brief list by telegraph, for Aug. 2, will appear more complete on receipt of mail advices:

San Francisco—John P. McMurray, wall or ceiling covering; William K. Nichols, cash register; William Radford, brick kiln. California—Alpha Buker, Hueoeme, carriage curtain fastener; Eugene T. Burnett, Haywards, preserving eggs; Jonathan Elwood, Sanger, ant or insect guard; Frank X. Fischer, Oakland, boiler; Joseph S Fredlph, Porterville, clasp; Stephen A. Menzemer, Santa Clara, drier.

Oregon—James McCourt, Salem, metric model; Neil Olson, Portland, wagon axle; Charles H. Timms, John Day, Or., door check; Charles W. Tremain, Portland, steam stamp; Charles W. Tremain and S. Johnson, Portland, steam engine.

Washington—Robert S. Dyff, Tacoma, pavement; William H. Starks, Bellevue, strawberry-vine cutter.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible (by mail for telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

MARKET REPORTS.

Local Markets.

SAN FRANCISCO, Aug. 4, 1892.

General trade the past week was fairly active, with a large increase in the volume of goods sent out. The call continues largely of an assortment character. It is claimed that in next month stock buying will set in, when we can reasonably look for a large increase in trade. The low rates of freight secured by sail between New York and this city are being beneficially felt. A great deal more goods are shipped from here, while heavy shipments are being forwarded to us. The lower freights give a decided advantage to importers of those goods for which they are not in urgent need. Remittances from the country are slow, with no improvement looked for until farmers begin to market their grain. Low prices ruling for both wheat and barley are against free selling by producers. The large tonnage in port and to arrive gives assurance of an ample supply of tonnage with which to market the surplus grain at reasonable charters.

The local money market is still reported easy, notwithstanding a report in some quarters that there is a steadily increasing inquiry for funds for crop purposes. There is an almost total absence of speculation in any leading article of trade, outside of fruit, which is calculated to call for much money. At the East the general tenor of advices indicates a strengthening in the money markets, and that is no longer money lenders looking up borrowers, but it is now the latter looking up the former. The labor troubles at the East are, in some quarters, a serious drawback to some lines of trade. There are signs of a returning spirit of speculation in the stock exchanges of New York; heretofore, this has been followed by more life in the various industries of the country.

According to the introduction to Poor's Manual for 1892 the net increase in mileage of all railroads in the United States in the calendar year 1891 was 3898 miles. The mileage in the country has reached 170,601, and the investment over 11 billions, represented by about 4¾ billions of stock, 5¾ billions of funded debt, and 700 millions of unfunded and current debt. The earnings of all roads in the country in the fiscal year 1891 amounted to $1,138,024,459, of which operating expenses absorb $781,796,576, leaving $356,227,883 net earnings. Other income amounted to about 101¾ millions, making available revenue 457½ millions. Payments from this revenue included 225¾ millions interest on bonds, 90¾ millions in dividends, 64¾ millions in rentals, and the remainder in interest on unfunded debt and miscellaneous payments. The excess of available revenue over actual payments was about 40¾ millions. The surplus of roads in the New England group was materially smaller in 1891 than in 1890, and the same was true of the Central Northern group and Southwestern group. Results were nearly similar in the Middle group, the South Atlantic group and the Northwestern group. There was distinct improvement in the Gulf of Mississippi Valley group and the Pacific group. There was a slight increase in the average receipts per passenger per mile and in the average receipts per ton per mile, the latter being .929, compared with .927 in 1890.

SILVER—The market has ruled weak throughout the week. There appears to be an absence of snap and life, as if large operators are awaiting developments pending the international bimetallic conference. It is quite generally accepted that this session of Congress will not legislate further on the silver subject. The coming bimetallic conference is attracting more attention abroad and it looks now as if something practical will result. One of the latest and apparently acceptable schemes put out is that of Prof. Soelbor of Virginia, who recommends that the coming international monetary conference agree that no gold coin containing less than 2.8065 grms. of fine gold be allowed to be coined or circulated in contracting countries; that silver be coined in a proportion of 20 value units silver to one of gold; that silver be legal tender up to $20, and that silver coins of fixed standards of purity be withdrawn from circulation. Professor Soelber considers that everything depends upon the attitude of Great Britain.

MEXICAN DOLLARS—The market has held steady at around 68¾ cts.

QUICKSILVER—Receipts the past week aggregate 405 flasks, and exports by sea 28 flasks to Mexico. The market is said to be unchanged. The ship A. J. Fuller took out 400 flasks shipped to New York.

BORAX—Exports by sea the past week aggregate 2027 ctls. The market is steady at current quotations.

LIME—Receipts the past week aggregate 2006 bbls., and exports by sea to Mexico 2300 bbls. The market is steady at $1.40@1.50 per bbl.

PIG IRON—Imports the past week aggregate 200 tons from New York. The market is quiet at barely steady prices. Imports from Atlantic seaports are against sellers of foreign. Eastern advices report dull and lower markets, but English advices report active speculative trading.

TIN—Both pig and tin plate are in lighter inquiry, but the market is fairly steady. The consumption has been larger than was estimated early in the year. The increased demand came chiefly from canners of fruit, New York mail advices report more speculative dealing, with appearances indicating that it is being done in the interest of the bulls.

PIG LEAD—While the market is reported unchanged, the feeling is easier. The Eastern markets are flat and easy.

COPPER—The market has exhibited slightly more strength, owing to the last of the old French syndicate copper having gone into consumption. The supply and demand, both East and abroad, appear to be so regulated as not to make any violent fluctuations either up or down.

COAL—Imports the past week aggregate as follows: Cons Bay 1250 tons, Nanaimo 2000, New York 200, Cardiff 3505. Total 6955 tons. While the market is not quoted higher, yet the tendency is unmistakably upward. Buyers are now looking up sellers instead of sellers looking up buyers.

Mining Share Market.

SAN FRANCISCO, Aug. 4, 1892.

Mining shares the past week disappointed the many who looked for a sharp move up to follow the break in last week, but perhaps it was the presence of Bob Morrow (D. O. Mills' respected broker) in the Board that kept prices down. If this is so, now that he has gone to his ranch for a few days, the bulls may toy at the game and strengthen the market, for the mice play when the cat is away. The stock pools and mill rings' wicked partners (Carson river ranchmen), in the water privileges of the Carson, have not as yet relented, but still refuse to allow sufficient water—so say insiders—to flow down the river to run *any* of the stamps in the mills. After the managers of the various groups of Comstock mines have one or more assessments levied, and driven in all the shares possible, it is not at all unlikely but the mill rings and stock pools' wicked partners will experience a change of heart and allow plenty of water to flow down the river with which to run the mills to full capacity. If the shares are well in hand, it may also be in order for the inside to show up the rich ore found to the west. In outside shares, trading was at about as low an ebb as ever before known, notwithstanding that in one or more of the mines in each group, ore can be shown up in sufficient quantity to pay dividends. In the Quijotoa mines very important development work has been done lately, and rich ore run into, but the public has been kept in ignorance of the fact. The managers even went so far as not to file the weekly letters of the superintendent; but the president, W. S. Lyle, of two or three of the companies paid a visit to the district. What he saw and did is not for the public to know. His trips cost money, and, it is said, help materially in depleting the treasury so as to give an excuse to levy assessments for the purpose, it is claimed, of freezing out outside shareholders. It is a great game, this of freezing out outsiders after they have paid to develop a property, and only those who should be elsewhere and in a different occupation can be found capable or willing to do the work.

In mining on the Comstock, it is said that some wonderful freaks of nature have been found; but there are many who claim that perhaps the most remarkable discovery in this line is the appearance of such men as Wells, Hirschfeld and Zadig as reformers. They claim that it looks as if wonders will never cease.

At a late meeting of the shareholders in the Savage Mining Co., Charley Hirschfeld read some kind of a reformation resolution which was adopted. Now, since Mr. Hirschfeld is in the reforming business, why does he not have the rich ore in Alpha, of which he is president, shown up? Over two years ago the superintendent, a Mr. Hamilton, reported the ore, gave its assay value and width, and since then there has been an almost continuous round of assessments by the Alpha Company.

If Messrs. Wells and Zadig truly desire to make reforms why do they not make public the superintendent of the Occidental mine, reports of car sample assays of all ores extracted, and the assays and particulars of all new ore found? The above information is as important to shareholders as it is to insiders.

It looks very much as if everything is being made as black as possible so as to discourage and demoralize the public and those who have shares, into selling, and at the same time prevent others from buying. What this is being done for, time alone will tell, at present it gives color to reports that rich ore to the west is being developed for cheap and expeditious extracting, and a desire on the part of insiders not to let outsiders benefit by it.

Our correspondent, E. O. Smith, is informed that Nat Messer, president of the Hale & Norcross mining company did not say that it would be time enough to see about buying or leasing a mill when the insiders secured about all the outstanding shares. What he did say was it would be time to do so when they found enough ore to justify such a course. Possibly Mr. Messer meant what our correspondent says, for there are experienced mining men who are outspoken in saying that there is high grade ore in the mine to the west, and on more than one level, too, which will pay dividends if honestly milled.

M. W. FOX, plaintiff in the Hale & Norcross suit, has filed in this city and Virginia a written bid to the directors of the Savage Mining Co. agreeing to mill Savage ores for one year at $3.50 a ton. He requires that ores shall be delivered at the mill (the cost of delivery not to exceed the cost for delivering Con. Virginia ore at the mill) he shall designate, at the company's expense, and agrees to return in bullion no less than 65 per cent of the car sample assays of all ores of not less value than $20 a ton.

There is no longer occasion for doubting that on the Comstock lode the mines are in splendid condition for working and that when the share market is in better shape for handling, that ore will be extracted and dividends be paid by one or more of the mines. That insiders are steadily buying shares from outsiders goes without saying. The latter seldom, if ever, buy when a campaign of fraud has been waged. Whether the inside has taken advantage of the developments in the Hale & Norcross suit to besmirch themselves so as to disgust outsiders with the business, is as yet an open question. There are many who incline to the opinion that they have done so, but in the absence of posi-

tive proof, it is well to be skeptical on the subject. That the rings and pools succeeded in getting large lines of stocks since the soit cannot be denied, but how much more they want before showing up the ore on the Comstock and in two of the outside districts, no one appears to know.

U. S. Senator John P. Jones writes to the Mining Stock Association that he has no personal interest in any mill on the Comstock, and has not had for a long time past. It was not much more than a year ago when a paper in this city, the *Daily Report*, stated that Hayward & Hobart had disposed of their interest on the Comstock. This denial held good until the Hale & Norcross soit showed that they were largely interested on the Comstock.

It is stated by those who should know, that arrangements have been made to introduce electricity as a motor in the Bodie district. Fuel has always been expensive in that district, and with electricity a big saving will be made.

New Incorporations.

The following companies have been incorporated, and papers filed in the office of the Superior Court, Department 10, San Francisco:

IRMA GOLD-MINING Co. Capital stock, $1,000,000. Directors—W. H. Bodwell of Santa Clara, J. F Sims of Berkeley, J. E. Markley of Oakland and L. A. Bodwell and William H. Robinson of this city.

HONEYCOMB MINING Co Location, Ynba conuty. Capital stock $100,000. Directors—Henry Mallock, George W. Pine, F. W. Johnson, O. G. Mayo, W. B. Meek.

MOUNTAIN VIEW WATER Co. Object, to conduct the waters flowing from the laguna on the summit, San Antonio, Adohe, Matiadero and other creeks in Santa Clara conuty to the residents of Fremont Township and the inhabitants of Mountain View, Mayfield and Palo Alto. Capital stock, $500 000. Directors—Otto Arnold of Mountain View, Bradford W. Smith and L. F. Richling of Oakland, and Christian F. Ruppel and William Mnehe of this city. Arnold holds 1000 of the 1050 shares of the par value of $10 each.

GERMAN MUTUAL SAVINGS BANK. Location, Oakland, Alameda Co. Directors—Jacob Greenwood, C. C. Nordhansen, William Moller, J. C. Westphall, R. F. Christ, A. Kayser, J. F. Sohest, C. Jurgens, S. M. Babbitt, William Nelle and A. C. Henry.

SAN FRANCISCO AND DENVER RAILWAY Co. Capital stock, $12,000,000. The object of the incorporation is to construct a standard gange road from a snitable point on San Francisco hay in Alameda conty in a general easterly and sontherly direction throngh the connties of Alameda, Contra Costa, San Joaqnin, Stanislans, Merced, Tnolnmne, Mariposa, Fresno, Inyo and Mono to a convenient point on the State line between California and Nevada. The length of the proposed road is estimated at 300 miles. The directors, who live in this city, are Thomas R. Hayes, Daniel E. Hayes, James Joyes, Charles E. Alberger, and Wm. C. Alherger. The project seems to have been conceived hy W. C. Alherger, the civil engineer. He came ont here in 1883 to associate himself with Wilhnr's San Francisco and San Joaqnin Valley Railroad. He soon retired from that enterprise. Since then his interest and ambition have nnrsed the plan of a new transcontinental road, and while carrying on irrigation and other engineering enterprises, surveys and plans for the railroad have qnietly progressed and have apparently been stimnlated into greater activity hy the recent agitation for a competing road. Mr. Alherger says that the men financially interested in it were all men of wealth in Enrope, who had large investments in similar enterprises. The incorporators were merely friends of his who had no active interest in it. Terminal facilities somewhere on the eastern shore of the hay had been bonded, half the rights of way secured and surveys had been made which determined very closely the cost of the road. The ronte in a general way would run sonth of Stockton, close to the north side of the Yosemite valley, and on throngh central Nevada, providing a line between San Francisco and Denver 250 miles shorter than the Central Pacific. There were two or three alternative rontes across the monntains. The road would be in a position to hnild np a large local traffic. No assistance other than rights of way would be asked here.

J. ROYLANCE BRASS WORKS. Capital stock, $100 000. Directors—Joseph Roylance, Chas. H. Dunton, Thos. A. Downing, E. A. Downing and Leon St. Denis.

LA PURISSIMA BITUMEN AND OIL Co. Capital stock, $500,000. The objects are to mine for asphaltnm and bitnminous rock and to bore wells for the extraction of petroleum. Directors—E. B. Hill of Lompoc, A. S. Hnbbard, Leo C. Williams, J. F. Holling and C. B. Tilley of this city, with the last two named holding each 12 000 and Hill 50,980 of the snbscribed for shares.

BECK, PYHER & Co. Capital stock, $100,000. Object, to carry on the business of dealing in wines and liqnors. Directors—Adolph Beck of Alameda, Berthold and Felix Pyhrr, Leo Kalman and Ernest F. Tamm of this city.

WASHINGTON AND COLUMBIA RIVER R. R. Co. (Walla Walla, Wash.) Capital stock, $3,000,000. Directors—L. Ankeny, W. D. Tyler and F. W. Paine. The object of the corporation is to hnild a road from Hunt's Jnnction to Puget sonnd; also to hnild a road from Pleasant View, the terminal of the Oregon and Washington Territory Enreka Flat branch, to Riparia. The new corporation is nnderstood to be a reincorporation of the Oregon and Washington Territory, which road it expects to acquire by purchase.

WANTED.

A position hy a Mining Engineer and Metallurgist. Lead and Copper Smelting. Address Box W., this office.

WANTED.

Position as Manager or Assayer, at a gold or silver mine. Many years parctical experience in the management of mines and the milling of gold and silver ores.

Address Box C, this office.

WANTED.

Position as Superintendent or Metallurgist.

First class Mining Engineer and Metallurgist, several year's experience in Europe, America and Mexico, is open for engagement. Graduate of one of the best mining schools in Europe. Best references. Address,

Secretary Concordia Club, San Francisco, Cal.

WANTED.

The owner of a group of Nine Gold Veins, two of which average $30 per ton gold, wishes to give a working bond on very reasonable terms, to party who will develop the property. Wood and water convenient and abundant. Only bases in ores are iron and sulphur.

Addreee Box 1, PONY, Montana.

Assessment Notices.

CALIFORNIA VERDE ANTIQUE MARBLE COMPANY Location of principal place of business, San Francisco, California; location of works, Placer County, California.

Notice is hereby given that at a meeting of the Board of Directors, held on the 12th day of July, 1892, an assessment (No. 2) of One Cent per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the Company, 3 8 Pine street, San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the 22d day of August, 1892, will be delinquent and advertised for sale at public auction, and unless payment is made before, will be sold on MONDAY, the 12th day of September, 1892, to pay the delinquent assessment together with costs of advertising and expenses of sale.

By order of the Board of Directors.

W. J. GURNETT, Secretary

Office 3 8 Pine Street, San Francisco, California.

GOVER MINING COMPANY. LOCATION OF PRINcipal place of business, San Francisco, California; location of works, near Drytown, Amador County, California.

Notice is hereby given that at a meeting of the Board of Directors, held on the 28th day of July, 1892, an assessment (No. 3) of Ten Cents (10c) per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Treasurer of the Company, at his office, Nos. 13 and 15 Fremont Street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on Thursday, the 1st day of September, 1892, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 26th day of September, 1892, to pay the delinquent assessment together with costs of advertising and expenses of sale.

ROBERT McF. DOBLE, Secretary.

Office—Nos. 13 and 15 Fremont Street, San Francisco, California.

HORACE D. RANLETT,

Ores, Mining, and Commission,

420 Montgomery St., S. F.

Ships under advances to smelting works in Boston New York, Baltimore and Liverpool.

Twenty-five years' experience in Shipping Ores and Managing Mines.

Solicits Consignments of Copper Produce and Management of Mining Matters.

SAN JACINTO ESTATE, LIMITED,
Office of General Manager,
P. O. Address, South Riverside, San Bernardino Co., Cal.
CAJALCO, Dec. 18, 1891.

MESSRS. ADAMS & CARTER, 132 Market Street, San Francisco, Cal.—GENTLEMEN: After a continuous trial of different concentratore comprising the Frue Vanner, the "Holland," "Parad x," "Triumph" and t e "Woodhur" concentrators), extending over several mon hs, we find that we prefer the Frue Vanner, as it is easier of adjustment, runs smoother, has less wear and tear, and—having a positive travel—gives less trouble than the other m re complicated and ever changing mac ines now in use here. The Frue Vanner not only saves a cleaner concentrate, but has less loss in the tailings, and is in several ways preferable to the other concentratore here.

I am, my Dear Sirs, Yours faithfully,
S. HARRIS, Manager.

For any information, or for pamphlets, or for circulars or testimonials, call on or address us at our office.

Price of 4-foot wide Belt Frue Vanner..... $550, f. o. b.
" " " Improved Belt Frue Vanner..... 800. f. o. b.

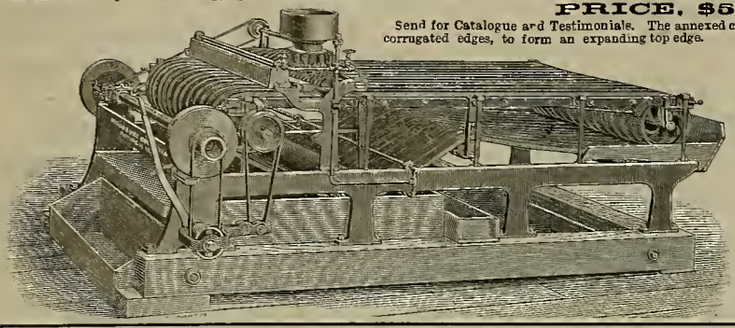
THE WOODBURY ORE CONCENTRATOR WITH IMPROVED BELTS

Was awarded the Highest (Bronze Medal) Premium at Mechanics' Institute, 1890 and 1891. MORE THAN DOUBLE THE CAPACITY with one-half less power and occupying less than one-half the space of any other concentrator. Built of Best Steel and Wrought Iron. Strong and Durable.

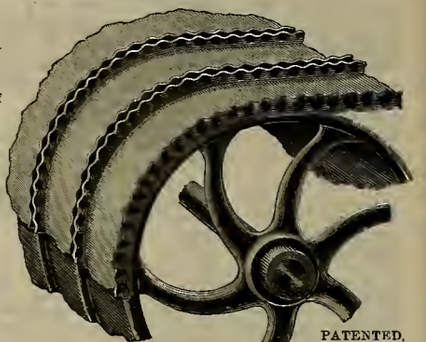
PRICE, $575, f. o. b.

Send for Catalogue and Testimonials. The annexed cut shows the belt in its improved form, which consists of corrugated edges, to form an expanding top edge.



THE SAN JACINTO ESTATE—Office of the General Manager. CAJALCO, Oct 30 '91.
GEO. E WOODBURY ESQ.—Dear Sir: I reply to yours of the 27th i st., respecting the working and efficiency of the "Woodbury" Concentra or placed in our works by you, I am pleased to inform you that it is giving entire satisfaction; it has a much greater capacity than any other machi e and is doing fully one-third more work, with the concentrates e nally clean, as from either of the machines at work here.
[Copy] Yours faithfully, S. HARRIS, Manager.

THE SAN JACINTO ESTATE, LIMITED—Office of General Representative, P. O address, South Riverside, San Bernardino County.
CAJALCO, February 17th, 1892.
GEO. E. WOODBURY:—Your letter of inquiry about your concentrator came to hand in due course. Your machine is doing well, the motion is all right, and the machine is giving entire satisfaction. Yours faithfully
S. HARRIS.



PATENTED, Aug. 19, 1890.

GEO. E. WOODBURY, Man'f'r, 213 to 219 First St., San Francisco.

CALIFORNIA
State Mining Exhibition
AT
THE STATE FAIR OF 1892,
TO BE HELD AT
SACRAMENTO, SEPTEMBER 5th to 17th,

PRELIMINARY TO THE GREAT COLUMBIAN EXPOSITION AT CHICAGO NEXT YEAR.

THE INTENTION OF THIS EXHIBIT is to show mining, as far as practicable, in all its various branches.

A space comprising nearly 30 000 square feet will be devoted to the exhibition of all kinds of Mining Machinery, appliances, and miners' supplies.

A COMPLETE FIVE STAMP MILL will be in actual operation, Also a LARGE ELECTRICAL PLANT showing the appliance of electricity as a motive power.

THIS DEPARTMENT OF THE STATE FAIR will be a distinctive mining display, the first ever witnessed in the history of the State, and is intended to promote interest in this most valuable industry.

All patentees and manufacturers of mining machinery are invited to show their appliances, either in model or actual size.

TRANSPORTATION FREE.

FOR FURTHER INFORMATION apply to W. G. SCOTT, Sup't of Exhibit, Office, 22 Montgomery Street, San Francisco, Cal.
Or to G. M. MOTT, Chairman Mining Exhibit, Sacramento.

THIS EXHIBIT IS MADE UNDER THE AUSPICES OF THE STATE AGRICULTURAL SOCIETY, and will receive every assistance possible from said Society to promote its success.

FREDERICK COX, President. EDWIN F. SMITH, Secretary.

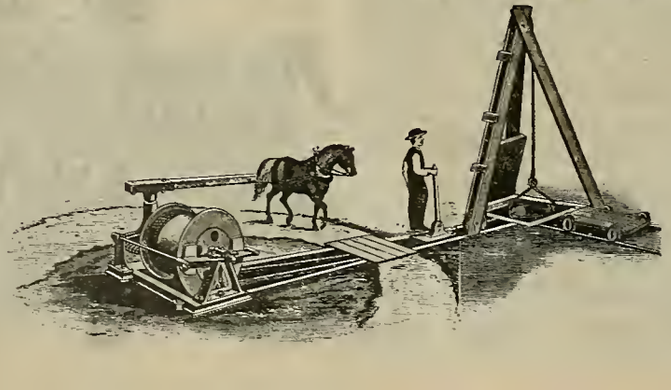
JOSHUA HENDY MACHINE WORKS,

NO. 51 FREMONT STREET, SAN FRANCISCO, CAL.

BUILDERS OF

"Sensible" Horse-Power Hoisting Whims.

(DAVIS PATENT.)



PRICES REDUCED.

The "Sensible" Hoist is the cheapest and beyond doubt the best in the market It is built entirely of iron and steel, mounted on a heavy iron base plate, and is therefore very durable and not affected by exposure to climatic influences.

The bevel gear on the drum shaft is loose, and, in hoisting, drives the drum through a friction clutch. This avoids the frequent accidents occurring with other Whims, occasioned by the breaking of the gear teeth when throwing them on of gear. In lowering, the drum is pressed by a powerful screw lever against brake woods at the opposite end Perfect means of adjustment are provided for the friction clutch and brake blocks.

As the drum is entirely independent from the driving gears the operations of hoisting, dumping bucket and lowering can be performed with the horse in constant motion, a feature not possessed by any other horse hoist in the market, and one that greatly increases the capacity of the machine by avoiding the loss of time due to stopping and starting the horse

It is very light and compact and very easily taken to pieces for transportation by mules. The cost of erection is very small, two men in half a day being able to put it in place ready for work.

Weight of hoist, 1200 lbs. Total shipping weight, including sweep, levers and sheaves. 1400 lbs.

Circulars giving Capacities and Prices furnished on application.

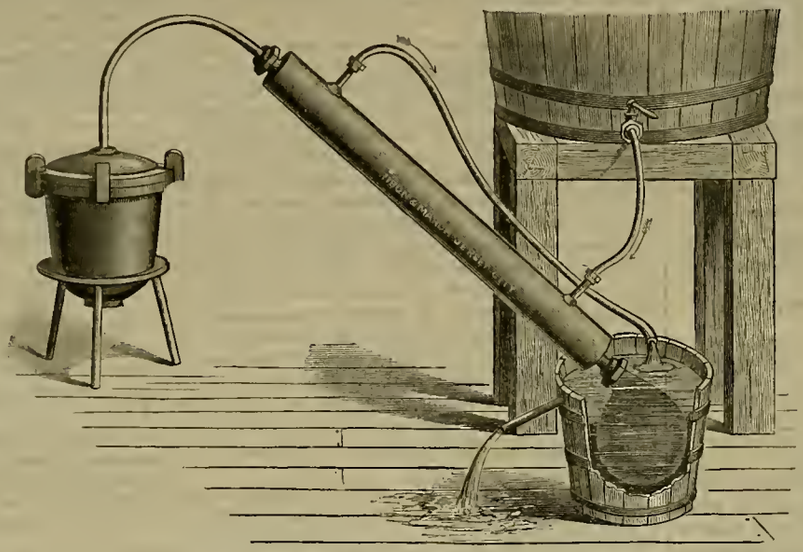
The Hydraulic Mining Bill.

Congress has adjourned, and the Caminetti Hydraulic Mining bill failed to pass the Senate and goes over until next session. The leaders of the two political parties each lay the failure to the other side, but at any rate it did not get out of the Senate Committee's hands to be submitted to a vote. The fact is, three calls for a session of this committee were made, at neither one of which was a quorum secured, but it was found two of the members present were opposed to some portions of the bill. A majority report for the bill, however, might have been forced by Senator Felton if the committee could have been got together. In that event, there would have been opposition to its passage when it came up for hearing in the Senate. As there was no possibility of its being considered in the Senate this session for want of time, and in accordance with the taut agreement of Senators upon both sides that no new measures would be considered which would delay adjournment, it seemed clear to Senator Felton and other friends of the measure that it was better to defer the report until the meeting of the next session, with a view and the possibility and probability of obtaining a unanimous report when it is hoped to pass the measure. Should the Senate Committee have reported the bill, it would have been reported with several minor amendments, which would have necessitated its again being sent to the House for its concurrence, which there was no likelihood of obtaining this session.

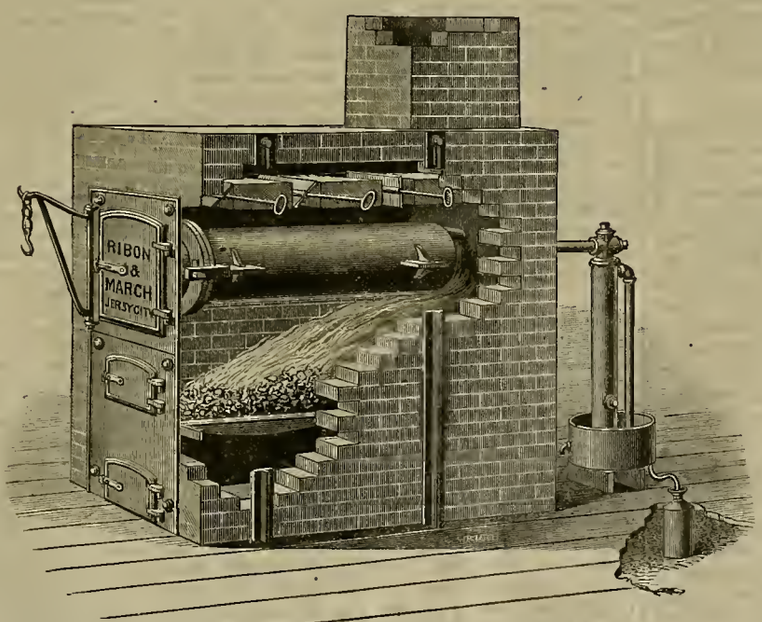
All those interested will now have sent them a copy of the bill as it passed the House. The object is to obtain favorable action upon such a measure as will promote the mining industry rather than to have a report from a committee which, under the circumstances, would have been of no practical benefit, but, on the contrary, might have jeopardized the final result. The miners will have to have patience and wait; but while they are waiting, it is just as well to remind them of the pledges of the Miners' Association to the effect that all hydraulic mining shall cease until the Government takes action. Those men who persist in working contrary to these pledges have already jeopardized the whole cause, and are liable to do still further harm. The man who continues to mine by hydraulic process under the circumstances should be considered an enemy to the hydraulic mining industry of California.

Retorts and Condensers.

The cuts on this page illustrate retorts and condensers for retorting gold and silver amalgam. The retorts are turned smooth throughout inside and are of a shape peculiarly adapted for rapid and complete evaporation of the quicksilver. The condenser attachment, shown in the first cut, which is made of either brass or iron, is, as will be observed, of very important use in facilitating the process of retorting by decreasing the time required, and permitting of a more perfect condensation of the quicksilver through its automatic action; adding but little to the cost. and can be applied to any retort pipe, as it is not a fixture, and if made of brass will not rust. The rubber bag attached to the end of the retort pipe prevents all danger of explosion. It should, of course, be immersed in a vessel containing water. The distention of the bag indicates that quicksilver is still being condensed, and its collapse indicates that the operation is complete. The tripod or retort stand can be readily and cheaply made by any blacksmith.



RETORT AND CONDENSER FOR SMALL GOLD MILLS.



HORIZONTAL RETORT AND CONDENSER FOR GOLD AND SILVER AMALGAM.

The second cut represents a retort for gold or silver amalgam, where the capacity required exceeds 1200 ounces. Several sizes of this design are made of capacities from 150 to 1200 pounds, Troy weight, of amalgam, when two-thirds full. They are made so that when the lower part becomes blistered or burned they can be turned over, ensuring a double life. These forms of retorts and condensers have been adopted from designs furnished the Joshua Hendy Machine Works of this city by Messrs. Ribon & March, of Jersey City, New Jersey. The condensers are built from new designs, and deliver the quicksilver, as is shown in the cut, directly into the flask without handling or loss.

A New Anti-Debris Association.

On Saturday last, representatives of five valley counties met at Sacramento in convention. They adopted resolutions condemning the Caminetti bill and any bill authorizing the construction of debris dams. How they expect to keep back the debris now in the streams without such dams was not explained. Still, as these men are not engineers, and have no experience in such matters, their opinion will carry no weight when opposed to that of the Government engineers, who recommend the dams to remedy the debris evil. The convention had to confess that the Antidebris Association was expending a great deal of money and accomplishing nothing. People are evidently tired of paying the bills for watchmen, and antidebris "grass is short." There was a great deal of talk in going over the old ground, and the same old antidebris leaders bobbed up serenely and gave their views which time, fact and circumstance have not changed in the least.

The outcome of the whole convention was a decision to form a General Anti-Debris Association, to consist of one member of the Boards of Supervisors from the counties of Sutter, Butte, Yolo, Solano, Colusa, Glenn, Tehama and Sacramento, and one member from each of the same counties from the Executive Committee of the convention of June 10th.

The supervisors selected were: G. O. Pates of Sacramento, E. T. Reynolds of Butte, S. H. Bradley of Yuba, W. M. Herd of Colusa, T. C. Snider of Yolo, and L. P. Farmer of Sutter.

Selections from unrepresented counties will be made hereafter.

From the Executive Committee the following were chosen: Wm. Johnston of Sacramento, E. Fagan of Butte, D. P. Durst of Yuba, A. H. Rose of Colusa, J. W. Snowball of Yolo, A. H. Wilson of Sutter, and W. H. Garrett of Solano.

E. Greer, chairman of the meeting of supervisors, was added to the list of members of the new association and was chosen president thereof. The association will meet in Marysville on September 22d, at 11 o'clock. It is understood that the finances of the association will be supplied by the counties in direct interest through the Boards of Supervisors. Robert Cosner was elected secretary of the association.

Comment.

"The greatest mineral belt on the Pacific slope" is just at present in the White Hills, Arizona. It has been found in so many places, however, that it is difficult to keep located for any definite length of time. As far as amount of product and number of paying mines have anything to do with the matter, the greatest mineral belt in California is up around Grass Valley and Nevada City, Nevada county; at the Comstock, in the State of Nevada; at Tombstone, in Arizona; around Baker City, in Oregon; at Cœur d'Alene, Idaho; and at Butte, Montana.

On Wednesday of this week silver went to the lowest price per ounce that is known in the history of the world. In London the price was 38⅛ pence an ounce bar silver. Only once before has this price been approached, and that was on March 28th and 29th, when the quotation was 39 pence. In New York on Wednesday it sold at 83 cents per ounce. London produces no silver, and England produces none, yet the London market controls the world in silver. That great city fixes also the price of copper among other metals. Not many months ago when silver began to advance, the silver miners of this coast were in great hopes of a revival, but they were doomed to disappointment. It has steadily receded in price for some time. The result has been the closing of many mines, and more must inevitably follow, as at present prices there is no money in working any expensively operated silver properties. At present the United States is purchasing 4,500,000 ounces of silver a month and storing it. We have now in the United States Treasury 357,189,251 standard silver dollars, and only 56,779,484 in circulation. Besides this, there are in the Treasury 78,933,000 troy ounces of silver bullion purchased with silver or coin certificates. If this bullion was coined it would amount to $102,055,000, and it would take the Mints of this country nearly three years and a half to coin it into standard dollars. Meantime, silver is going down month by month, although we are withholding it, and despite the fact that it has other avenues of disappearance, as China, for instance, from which place the silver sent never comes back.

The members of the Mechanics' Institute who voted on the subject of purchasing a new library building or remodeling the old one, decided to stay where they are. The architect has reported that the walls are sufficiently strong to support the weight of an additional story. In conformity, therefore, with the almost unanimous wish of the members, the library will be maintained in its present location, and the additional room required for its growing needs will be provided in an additional story. It is contemplated to give up the second and third floors to library purposes, and put the reading-room and offices on the top floor. Even with these changes, there will be no very great amount of room to spare. At present the books are crowded on high shelves aud are hard to get at. This institution ought to be strong enough by this time to have its building entirely to itself, without the necessity of renting so large a space as it does to stores.

There has been a good deal of newspaper talk about Mars and important observations at the Lick Observatory, it being expected that certain scientific theories, especially those relating to the supposed canals, would be disproved. The fact is, however, that the observations at this opposition of Mars are not specially important in the northern hemisphere, and in the southern hemisphere, where the opportunities for observation are better, there are no large instruments. In this hemisphere the planet is too low for good observation, the angle being such as to necessitate looking through a great extent of atmosphere. At the time of the next opposition of Mars, in October, 1894, the observers in the northern hemisphere will have a much better view, since, while the planet will be somewhat farther off, it will be higher and in good position.

The collector of customs at San Diego has been worrying himself unnecessarily over the fact that considerable gold dust is coming into this State from Lower California, which is Mexican territory. He did not particularly object to the gold itself, but he was afraid something was coming in which ought to pay duty and did not. He apparently thought the McKinley bill charged high rates on everything, as the partisan papers convey that idea. However, the collector now feels relieved since Assistant Secretary Crounse says that gold dust is exempt from duty, and no consular invoice is required. The department is of opinion that no formal entry thereof should be required where it is brought in on the persons of passengers, but for the purpose of securing statistics of information they should be required to report to the inspector the amount of gold in their possession. Still, the Government departments find themselves unable to obtain correct statistics of gold produced in our own country, and may have also a hard task collecting statistics of imports of the metal.

The Blue Jacket mine, belonging to the Blythe estate, is an elephant on the hands of Administrator Pennie. It is comparatively worthless, but cost considerable money. A keeper in charge, who received $4 a day, has a claim of several thousand dollars against the estate for back salary, and threatens to bring suit. This mine is the only one ever favorably recommended by the late J. S. Phillips, M. E., who resided in this city many years. He examined many properties on this coast, but condemned them all but this one. The late Thos. A. Blythe, on Phillips' advice purchased the property and expended some $150,000 upon it. There never were any returns to speak of, and the failure of this mine was one of the things which led to Mr. Phillips leaving California. He told the writer of this paragraph that the Blue Jacket was the only mine he ever saw on this coast which fulfilled all the geological requirements of a perfect lode. But its geological perfection did not make it a paying proposition.

The result of the 52-mile ocean race between the steam-tugs Relief and Fearless must have been rather a disappointment to the mechanical engineers and ship-builders of the Union Iron Works of this city, since the large new tug built by them showed no excess of speed over an older and smaller vessel built in the East. Both vessels belong to the same firm—the J. D. Spreckels Bros. & Co. The Relief was built by the Cramps in Philadelphia, eleven years ago. She is 204 tons burden, 112 feet long, 22.5 feet wide and 12.6 feet deep. She is fitted with engines of 650 horse power. The Fearless, built by the Union Iron Works, is a new boat, much larger thanthe Relief. She is the largest and most powerful tug ever built in the United States. She is 150 feet long, 26 feet beam, and is driven by triple expansion engines of over 1300 horse power. The vessels were docked, cleaned, painted and prepared in every way for the race, specially good coal being selected for the bunkers. The racers went from the bay out into the ocean around the Middle Farallone island and back, a distance of 52 miles, and the big Fearless only won by two lengths, a very small margin considering the disparity in size of vessels and power of engines. It is true these towing vessels are given wheels for that purpose, not speed-wheels, but they are both equal in that respect. The Fearless has not, however, come up to the expectations in speed, having been built for a 16-knot boat, and not steaming over 14 at her best.

The Late W. H. Patton.

W. H. Patton, the distinguished mining and mechanical engineer, died at San Rafael on Saturday last from softening of the brain, after a long illness. Mr. Patton was 61 years of age. He came into prominence on the Comstock in 1864, after having spent many years in the mines of this State. He was engineer of the bonanza mines during their palmy days, and designed a great deal of the machinery on the great lode, including prominent mills, hoisting and pumping works, etc. In 1878 James G. Fair resigned his position as superintendent of the bonanza interests, and W. H. Patton was chosen to succeed him. How great the responsibilities of such a position were will be better understood when it is stated that Mr. Patton, acting in the capacity of superintendent, was called upon to direct the operations of the Con. Virginia, the Union, Ophir, Mexican and California mines. During Mr. Patton's superintendency, he devoted much of his energy to developing the facilities for deep-mining, and to him more than to any other man whose name has been identified with the mining interests of Nevada is due the state of perfection which deep-mining has reached on the Comstock lode.

In 1887 he was selected as manager of the Broken Hill Proprietary mines in Australia, the greatest silver mines of the world. There he introduced the American style of timbering, such as is in use on the Comstock, and designed suitable modern machinery. He revolutionized the systems in vogue there and put the mines on a good basis. He acquired mining interests of his own while in Australia, which made him a very rich man. His health, however, gave out, and two years or more ago, he had to retire from active work and come back to California. He never recovered from the overwork of the later years of his exceptionally active life. His name will be found as designer on some of the largest and most important mining and milling machinery ever constructed.

Electrical Work in Progress.

The local electrical engineers will be apt to have plenty to do if all the projects which are planned, calling for their skill, are carried out. In electric railway construction particularly, there is much going on in various parts of the coast. Interior towns are also paying much attention to electric lighting and numerous plants are being arranged. There is not so much being done in the way of furnishing electric power for mining purposes, but even that branch is not entirely neglected, Nevada and Mono counties both having projects of the kind in hand. The progress of electrical construction and installation on this coast must be very gratifying to those manufacturing electrical devices, and it is entirely probable that this branch of business will be largely increased in the future. We append some notes of work in progress and proposed in this State and elsewhere on the coast:

THE City Council of Tucson, Arizona, has adopted a resolution to enter into a two-years' contract for the electric lighting of the city with the person who will first put a plant in Tucson.

N. H. WHARTON has returned to Phoenix, A. T., from Chicago and will begin the construction of the electric railway before September 7th, the time of the expiration of the fraochise. Twenty-five thousand dollars was placed to his credit in the National Bank of Chicago by capitalists as a forfeit should they fail to begin work.

J. P. SMITH has purchased the stock of A. P. Hotaling in the Pacific Avenue Street R. R., Santa Cruz, which gives him controlling interest. Smith will probably transfer it to the Santa Cruz, Garfield Park and Capitola Electric Street Railway Company, and the motive power will be changed from horses to electricity. This road runs from the Pope House to the beach, and is the pioneer street railroad of Santa Cruz.

SUPERVISOR PELOUSE of Alameda county tells the Haywards *Journal* that the proposition of F. Chappalet & Co., to build an electric road from Haywards to San Jose had not died out, for Mr. Chappalet had informed him that he was not going to forfeit his franchise which will expire soon, but will lay enough track to hold it, and as soon as possible go to work building the road. The remarkable travel over the Haywards, San Leandro and Oakland electric road is sufficient to show Mr. Chappalet what is possible in Washington township.

THE Vandercook-Sessions electric road, from Eighth street and Broadway to East Oakland, will be in operation in 90 days from date. The powerhouse has been finished and contracts have been let for the equipment of the road aod the power machinery. The contract for cars has been let to Carter Brothers of Newark. The Risdon Iron Works has the contract for the power machinery, and the Thomson-Houston electric system and plant has been adopted for the operation of the road. All of these contracts provide that the plant furnished shall be completed and in running order within 90 days from date.

THE latest enterprise talked of in Sutter Creek, Amador, is the organization by four citizens, J. Dennis, R. C. Downs, M. Brinn and C. R. Downs, for the purpose of putting in electricity for lighting the town. The old Donnelly and Howard foundry ground has been bonded for the purpose, where the plant will be fixed. They

claim with the water facilities, pressure, etc., that light can be furnished at about the same expense as coal oil. What stock is not disposed of, if any, will be kept by the promoters and the capital furnished, so that the consummation of the enterprise is in a great measure assured.

THE Salem (Oregon) Motor Railway Co. is working on its new electric line and ties and poles are being delivered. The rails are 40 pound steel T rails. The Thomson-Houston motors have been ordered from Lynn, Mass. They will have fifteen horse power and will be the best made. One important point about them is that the grinding noise so common with motors will be done away with by having the gearing encased by an iron covering and so constructed that it will run in oil. By that means there will be no noise about the car except the rumbling of the wheels. The trucks will be the Brill, which are made at Pittsburg and are known as the standard. The present gauge of the track will be retained as that, after long service, has been found to be the most practical.

APPLICATIONS have been made to the Board of Trustees of the city of Alameda for two franchises for an electric street railroad, the applicants in both cases being the purchasers of the Meetz horse car franchise. The first franchise begins at the corner of Santa Clara avenue and St. Charles street, running through St. Charles to Kings avenue, to Morton street, to San Jose avenue, to Park street. The second, which will be joined to the first by the existing Meetz franchise on Park street, begins at the corner of Park street and Santa Clara avenue, running through Santa Clara to Versailles avenue, to Central avenue, to High street, and out High street to the northern line of the city. If this franchise be granted, as is believed will be the case, it will complete a system which will prove extremely convenient to nearly every part of the city. The petitioners for the franchise promise to make no delay in the construction of the road, and guarantee that the franchise is asked in earnest, and not merely as an obstacle to somebody else who might desire to build an electric road through the same territory.

ALF. TREGIDGO of Grass Valley tells the *Tidings* of that city that the company he has been organizing to furnish the mines of Nevada City and Grass Valley with electric power is about ready for business. The principal electric companies are already bidding for the contract to put in the dynamos. Mr. Tregidgo owns a valuable water right on the South Yuba river, which at the lowest stage carries 2500 miners' inches of water. A dam will be put in near the Purdon bridge, from whence a canal will be constructed on the south bank a distance of about four miles, where the dynamos will be stationed. A pressure of 400 feet will be gained by reason of the canal, and the water will be returned to the river. The canal's capacity will be 6000 inches, that it may meet the largest demands for power in the future. Mr. Tregidgo expects to make public, shortly, the complete details of this project, which is calculated to give mining a new and very material impetus. The dynamo station will be put three miles distant from Nevada City and seven miles from Grass Valley, hence the loss of power in transmission will be light. Right of way for the electric wires and the canal, and a site for the dynamo station, have been secured.

ARTHUR D. Thompson and W. A. Jacobs, representing Oakland capital have applied for a franchise for a new electric road in Sacramento. The route desired is as follows: Commencing at a point selected by the grantees on the Southern Pacific grounds near the south side of the passenger depot; thence in a southeast direction to a point near the intersection of Third and I streets; east along I to Seventh; thence on Seventh to Seventh and G; thence along G to the intersection of G and Twentieth; thence south on Twentieth to Twentieth and H; thence on H street to the intersection of H and Thirty-first; thence south on Thirty-first to the intersection of Thirty-first and N; thence west on N to the intersection of N and Seventh; thence north on Seventh to the intersection of Seventh and I, to connect with the line at I. Then beginning at the connection with the said line of railroad at the intersection of N and Seventh, running south on Seventh to the intersection of Seventh and T; thence east on T to the intersection of T and Thirty-first; thence north on Thirty-first to the intersection of Thirty-first and N, to a connection with the line on N. Then commencing on Sixteenth at the intersection of Sixteenth and G, running north on Sixteenth to the intersection of Sixteenth and the northern boundary line of the city. The rates to be charged shall not exceed five cents, and grantees shall pay an annual license of $5 on each car. If they get the franchise they propose to equip the road with all the latest appliances.

REDLANDS, San Bernardino county, is to have an electric light and power system, a franchise having been granted George H. Crafts, George B. Ellis, F. G. Ferand and H. H. Sinclair. It is designed to erect a plant that will, together with the land, cost $20,000, and the system to convey the electricity to and through the city will cost $40,000, a total of $60,000. There will be two six-inch Pelton water wheels,, and a sufficient fall can be secured to develop 800 horse power. W. Howard White, one of the ablest civil engineers in that part of the State, is in charge of the work and is in the field with a party making surveys, measurements, etc. It is the intention of the company to advance the work as fast as it can be done. It will require several months, however, to complete the plans, erect the buildings and get the machinery in place. Application has been made by a large manufacturing concern for power, with the view to starting a large factory between the city and the canyon. The new company ha acquired water rights on Mill creek for power purposes, and will not interfere with the rights of those using the water for domestic or irrigating purposes. One advantage to the owners of the water is the fact that by carrying the water for a distance of 10,000 feet through pipes, from 300 to 400 inches of water will be saved that is now lost by seepage, and the company will make no claim to the water thus saved. Here is a chance for another pipe contract.

Coast Industrial Notes.

A SIXTY-FIVE THOUSAND DOLLAR high school is to be erected at Redding this year; also a $25,000 Y. M. C. A. building.

THE Marin County Water Company is building another large distributing reservoir on the top of one of the hills behind San Rafael.

BUILDINGS for the Carlson-Currier silk factory in Petaluma, are nearly ready for the machinery, which will be all in place and in running order by the 1st of October.

D. W. EARL & CO. has been kept busy during the past two weeks putting the big freight wagons in repair in anticipation of an increase of business between Hawthorne and Bodie.

THE Palermo Land and Water Company and the Pacific Improvement Company have jointly contracted to build a $50,000 hotel at Palermo. A. Page Brown is the architect, and the structure will be a picturesque summer hotel.

OVER 100 people from Santa Rosa are employed by the Sebastopol Packing Company, and a special train is run between the two towns for their accommodation. The company is shipping from one to three carloads of fruit daily.

THE Comstock mining and milling company disbursed a total of $137,433 for labor for the month of July. Owing to the drafts of men from several of the mines, and the stoppage of some of the mills, the pay rolls next month will be smaller.

THE twenty million dollars in gold shipped by rail from San Francisco to New York has arrived safely at its destination. There were 500 boxes in all, each box weighing 150 pounds and worth $40,000. The entire weight in gold was 75,000 pounds.

ACCORDING to the latest advices by telegraph, coal freights from Europe and Australia are firm and slightly higher. Owners seem unwilling to accept charters even at the advanced rates, and manifest a disposition to hold for still better figures.

THE Sante Fe company is arranging with San Diego citizens to send out another "California on Wheels." A special car will be fitted up with an exhibition of southern California products and hauled through the East. It will start eastward on the 22d inst.

THE beet sugar factories of Watsonville and Alvarado will start up on the 20th inst., with double the capacity of last year. The Chino factory has been running for about a month, and is turning out 1000 sacks of sugar a day, which is three times the amount produced last year.

DURING the month of July, flasks of quicksilver were shipped from the mines of Napa, Lake and Sonoma counties as follows: Gt. Western, 600 flasks; Napa Consolidated, 425; Mirabel, 199; Sulphur Bank, 110; Baker, 2; total for July, 1336 flasks. The 1336 flasks are equal to 102,204 pounds of metal, having a value of $60,000.

DR. MAHONEY and his partners have let the contract for building their dam on the Agua Fria, Arizona. It will be one of the largest in that section and will place the Harqua Hala country in a position that both its mines and farms will have sufficient water. A large number of people are now locating land under the canal that will be taken out at the dam.

A TUNNEL 1140 feet long on the Fort Bragg Logging Railroad, Mendocino county, was completed on Tuesday, connecting Pudding creek with the Noyo river, where the Fort Bragg Redwood Company will carry on logging operations this season. The tunnel opens up a fine body of timber, miles in extent, where an ax has never been struck except for ties.

WORK has begun at Fresno on the Pine Ridge flume and several hundred laborers are on the ground. It is expected to build one mile per week. The flume will be the largest in California, although not the longest. It will be double; one part for floating lumber and the other part for carrying water for irrigation. By means of the flume it is expected to irrigate 40,000 acres of land northeast of Fresno.

THE property holders of Park street, Alameda, have finally decided that they will favor the bituminizing of Park street between the railroads, and they have prepared the plans and specifications that they prefer to be followed by the city trustees in ordering the work done. Of the 4000 feet of street, the owners of 3600 feet have signed the contract for the work to the Santa Cruz Paving Company.

A dispatch from Victoria, B. C., says: B. M. Rudy of the Vulcan Iron Works of San Francisco, arrived from the north several days ago, having just completed a cold storage system at Cunningham's cannery on the Skeena river, which is proving a big boom to the cannerymen, besides opening up a new phase of the fishing industry. When Rudy left Skeena 6000 salmon had already been frozen and were being prepared for shipment east. The fish, immediately upon being taken from the water, are put into a room where the temperature is 20 degrees below zero. They are left there six or seven hours, when they are removed to another and larger room, 30 degrees below the freezing point, where they are kept for a couple of weeks. They are then placed in hermetically sealed cases and are ready for shipment. It is claimed that they will keep for years and are just as good as fresh fish when opened. Other northern canneries are negotiating for the erection of similar plants, and it is expected that before long Easterners will be enabled to eat fresh Skeena river salmon in their homes. Besides opening up this new industry, coldstorage is also of great benefit to the canners in saving fish after a big run. For instance, while Rudy was up north there was an immense run of salmon on the Skeena and the canners could not handle the fish. Without coldstorage they would have had to stand on their docks and watch the fish running past their doors. With it they are able to take all the fish they can and put them in the coldstorage warehouse, where they will keep till they are able to use them.

Personal.

W. S. LYLE, the mining operator, has returned from a trip to Arizona.

PATRICK CROWTY, an old-time Pioche prospector, is at Kingman, Arizona.

J. H. NEFF, president of the California Miners' Association, is in Denver, Colo.

TIMOTHY KEEFE of this city is visiting the new camp of the White Hills, Arizona.

WILLIAM S. EDWARDS, who is interested in mining and other enterprises at Calico, is in the city.

W. T. JONES is superintendent and Jenkin Griffith foreman of the Bay State mine, near Plymouth, Amador Co.

O. F. KUENCER is on his way to St. Louis on business connected with his mining properties near Mineral Park, A. T.

PROF. ALPHEUS HYATT of Washington will hereafter be connected with the U. S. Geological Survey fieldwork in California.

D. H. JACKSON, superintendent of the Holmes mine, Nevada, is in town. He cannot say when the Holmes will resume work.

THOMAS POLLARD has resigned his place at the Talisman mine, Amador City, with the intention of moving his family to Los Angeles.

THE Democratic County Convention at Auburn has indorsed Assemblyman Dr. N. Martin of Placer as joint Senator with El Dorado county.

DR. T. BOYSON, a stockholder in the Kennedy mine, is up at Sutter Creek, Amador Co., from San Francisco, the guest of Senator E. C. Voorhies.

J. W. MUNN has a number of men at work on his mine in Music mountain, A. T., and is taking out some of the richest silver ore ever taken from that camp.

RICHARD L. OGDEN, formerly of this city, but now a resident of New York, is visiting California in connection with some mining operations in Tuolumoe county.

JAMES LOGAN has sold his mine near Fresno Crossing, Fresno county, to John D. Beam and others of this city for $5000. The mine will be put in operation at once.

E. H. DAVIS of Grass Valley, who came here from Australia in 1852 and has followed mining in Calaveras and Nevada counties, died near Grass Valley last week.

PROFESSORS BARNARD and Schaeberle, astronomers at the Lick Observatory, have had their salaries raised to $2400 per annum by the regents of the University of California.

CHAS. M. ROLKER, mining engineer, who accompanied Lord Randolph Churchill in his investigation of the mineral resources of Mashonaland, South Africa, has returned to New York.

ROSS E. BROWNE, who has recently been examining some mines in Wyoming, went, on his return, to Amador county on a mining examination. He came back to the city this week.

TOBIAS HOCKING, better known among miners as "Uncle Tobe," who worked for many years at the Bunker Hill mine, Amador City, died in England while on a visit to his native country.

JOHN MARTIN, an old pioneer of Trinity county and well known to many of the old timers in the State, died at Weaverville on Sunday a week ago. Mr. Martin was a very wealthy man. He was the brother of Henry Martin, the owner of the Brown Bear mine on Deadwood.

DR. POWERS of Sacramento and Mr. Sunderhaus of the Young America mine, Sierra county, have been at Gold Hill, Oregon, thoroughly prospecting recent discoveries in that section, and from the favorable showing thus far made, it is probable they will make investments in Rogue River valley.

PRESIDENT HARRISON has appointed T. R. Hofer superintendent of the U. S. Mint, at Carson to fill the vacancy caused by the death of Samuel Wright. Mr. Hofer was formerly chief clerk of the mint. The mint will be reopened as soon as his bond is confirmed, and no other changes of any importance will be made.

CAPTAIN CHESTER, Captain Brown and the eight miners who were supposed to be dead in Golovin bay were passengers on the steamer St. Paul to this city from Alaska. Captain Brown, who went up to Golovin bay prospecting, about a year ago, reports the gold mines of the Golovin bay region as phenomenally rich, and brought down three tons of good paying ore with him as samples.

JOHN B. PITCHFORD, mechanical engineer; H. B. Gale, professor of mechanical engineering at the Stanford University; and Lieut. John B. Finley of the U. S. Signal Service, each read papers at the last meeting of the Technical Society. Mr. Pitchford spoke of Corliss engines; Prof. Gale of hydraulic passenger elevators; and Lieut. Finley of the general circulation of the atmosphere, differing with the views of Marsden Manson, engineer of the Harbor Commission, who read a paper on the same subject at a previous meeting.

JAMES H. KINKEAD, superintendent of the Occidental mine on the Comstock, while carrying in his buggy $10,000 in coin to pay off the men, was stopped by a highwayman. Mr. Kinkead had a shotgun charged with buckshot across his knees, and replied to the demand by firing at the highwayman, the charge entering the latter's right arm and disabling him. After receiving the wound the highwayman ran and was pursued by Kinkead, who succeeded in capturing him after a race of half a mile, and brought him to town in his vehicle and and placed him in the custody of the Sheriff. While endeavoring to escape the highwayman discarded his rubber coat and mask, and Kinkead discovered on capturing him that he was an employe of the Occidental mill named William Hurd and aged 24 years. That rubber picked out the wrong man.

"Approved English Names for Western Trees."

Prof. Sargent's Criticisms Considered.

OAKLAND, July 30, 1892.

TO THE EDITOR:—Having kindly opened your columns from the first to the discussion upon the establishment of certain English names as being suitable for our western trees, I desire further to employ your valuable journal to report from time to time the progress of the new departure.

Returning recently from an extended reexploration of the forested mountains of Southern Arizona, we find awaiting us much interesting data concerning the proposed English names. I may say in general, that the reform movement seems to meet with almost unanimous support, which was not to be expected in certain quarters, where radical changes were proposed, and such approval is therefore all the more gratifying.

Where criticism or differences of opinion are given, it is generally offered in a considerate, kindly spirit, which is exceedingly helpful, and for which I am truly grateful.

The State Superintendents of Oregon and Washington write approvingly, and recommend that the Handbook (lately introducing these names) be placed in their school libraries, while most of the county superintendents of California receive the English names with favor, and several Eastern journals give extended notices of the Handbook, and encourage the preparation of the larger work to follow.

The most important indorsement of my efforts to establish suitable English names comes from Prof. Sargent, editor of *Garden and Forest*, for May 11, 1892. He gives a two-column editorial notice of the Handbook, quoting several paragraphs and giving nearly the full list of English names proposed for our Cone-bearing trees, "in the hope," he concludes, "of aiding the author to bring about a most desirable reform."

He also takes exception to a few of the proposed names, giving reasons therefor; and it is to these helpful criticisms that I wish particularly to refer at this time, for in most instances the exceptions are not well grounded, as I will endeavor to show.

"Alpine White-bark Pine" of the Handbook, designating in English our *Pinus albicaulis*, which we find with its white bark and its white annual branchlets fringing the upper limits of our alpine forests, he considers sufficiently designated by the shorter name of White-bark Pine; but all the trees of this order in high, wind-swept situations are apt to have more or less silvery white bark, whatever their color in less elevated localities. "White-stem Pine," alluding to the stout annual stems, would be a better name, and, moreover, it is a literal translation of the botanical one. This correction will appear in the next edition.

"Nevada Nut Pine" for *Pinus monophylla* he thinks not well chosen, because the species is not confined to the State of Nevada. To be sure, it extends to contiguous territory, but its headquarters of best development are in Nevada; and the same remark is true of the "New Mexican Piñon," which extends sparingly to adjoining regions, but is abundant in New Mexico. "Stone-seed Mexican Piñon" Prof. Sargent thinks "a rather unnecessarily long and awkward name." Awkward it certainly is, but exactly descriptive, and a similar name is necessary to distinguish this hard-seeded species from the two other soft-shelled piñones partly included in Arizona, though the "Stone-seed" is the principal one, and largely cultivated for food in Mexico, where it abounds.

"North Coast Scrub Pioe" for *Pinus contorta* he thinks might be changed to Contorted Pine. As neither the tree nor any of its parts are contorted (despite the fancy of Douglas, who named it), and considering that the tree is the smallest of our species and confined exclusively to the North Coast region, the preceding name was naturally suggested.

"Arizona Five-leaved Lumher Pine" is criticised as "an unfortunate designation, as the leaves are not always in 5's and the species does not produce especially valuable lumher." To this I have to say that the leaves—like those of other species—are usually constant in their number; and as to the other objection, this pine is one of those growing in the reach of the white man, and has been mostly cut away in certain localities and manufactured into lumber which is similar to the yellow pine of California, belonging to the same group—the "Broken-cone Lumber Pines."

"Canada Horn-cone Pine," for the curious little Canadian Pine, with its horn-like cones pointing forward along the branchlets, my critic thinks "not preferable or easier to remember than Gray Pine, hy which this species is universally known in Canada." But the horn-like cones of this species are unique in the great family of Cone bearers; the tree is not particularly gray in color, only "dull grayish green," according to Gordon, while we have agreed to call our gray, cloud-like *Pinus Sabiniana*, the "Gray-leaved Pine," which would conflict.

The approved names for our firs fare better, owing to the fact that "their identity and synonymy are more confused than the trees of any other group of conifers;" but "Feather-cone Red Fir" the editor thinks "inappropriate." Pray wherein? Its Latin name *Abies nobilis*, meaning Noble Fir, and so called hy some authors, is certainly inappropriate because the tree is less majestic than two other species, while the cones are clothed with recurved, heautifully fringed, hrown hracts, resembling the feathers of a bird—hence Feather-cone.

Concerning our redwoods, Prof. Sargent writes: "It hardly seems necessary to designate *Sequoia sempervirens* as the 'Coast Redwood,' as it is the only California conifer that is called Redwood; or to call *Sequoia gigantea* 'Giant Sequoia.' To our taste," he continues, "Big Tree is a simpler and hetter name." It happens that both Sequoias are decided Redwoods and both called Big Trees, hence some distinction is necessary. I thought to call one the Coast and the other the Sierra Redwood, hut "Giant Sequoia" is already in use and quite distinctive for the larger species.

"Alaska Ground Cypress" is objected to hecause "the tree sometimes attains a height of 100 feet, and it is by no means confined to Alaska." To this I have to remark that, compared with the other genera of cypresses, the trees of the genus *Chamæcyparis* are found with low, spreading branches, as the Latin name signifies, while Alaska is the principal home of this species.

"Arizona Red-bark Cypress" falls under criticism, "as it is the nnly species known to grow in that Territory, and so, simply Arizona Cypress would do as well." Late explorations in the Chirricahua mountains of Southern Arizona reveal, as we expected, that there may be two or three species of stringy-barked cypress, until the present unknown, in that Territory.

"Nor do we like 'North Coast Cypress' for *C. Goveniana*," writes our friendly critic, "as the species is found as far south as Monterey bay; or 'California Mountain Cypress' for *C. Macnabiana*, a rare and local species which grows on the foothills rather than on the mountains." I'm glad that the first-named cypress is admitted to be limited to the comparatively northern coast named, while the Mountain Cypress seems to have its headquarters, according to Mr. Carl Purdy, "on the top of Red mountain near Clear Lake;" also, according to Mr. Jeffrey, it was found by him "on the flanks of Mt. Shasta, at an elevation of 5000 feet."

I am glad to concede one exception as well taken: "Pacific Yew" of the Handbook is no better than Western Yew would have been; and, especially so, as Nuttall once called it *Taxus occidentalis*. This correction will be printed in future editions.

Lastly, Prof. Sargent alludes to my following the lead of Prof. Greene in taking up the name of *Tumion* of Rafinesque (not *Tuminon*, as twice printed in the *Garden and Forest* article) in the place nf *Torreya* of Arnott, and states that "the species in Florida is known by the vernacular name of *Torreya*."

Is it, indeed? Prof. Sargent's own census report of N. A. Forest Trees gives it as Stinking Cedar—one of the kind of names I am trying to get the public to discard.

A better name given the tree by other citizens is Nutmeg Tree. Only botanists would call it hy the Latin name of *Torreya*, a name commemorating one of the first botanists of America—Dr. John Torrey; hut, hallowed as is the name, when botanists learn that it is not available for this genus of Cone bearers, because it was previously applied to another genus, they must of course, however sorrowfully, take up the proper name, as I have done.

The editor of *Garden and Forest*, to whom I am indeed greatly indebted for his assistance in thus reestablishing on firmer grounds my proposed English names, concludes: "Such criticisms as those which we have ventured upon show the difficulty of fixing on any plant a vernacular name which will be acceptahle to every one, and will serve to emphasize the fact that the hest name for any plant is the Latin one which is given in accordance with a fixed and recognized principle and which cannot be changed except in accordance with that principle."

If the editor of *Garden and Forest* and other tree lovers will give the "Approved English Names" thoughtful attention, they will not find that I have entered upon this important innovation—which it must perforce appear to be in a few instances—without many years' examination of western forests and much careful comparison and halancing of appellations.

In this connection it should be mentioned that important discoveries have been made lately, concerning the conifers in the Territories of Arizona and New Mexico, but their discussion must be deferred to future articles, perhaps until the close of the exploring season, when time shall have been given for the examination of data and comparison of specimens. At present we can only pause to notice the evidences of approval nearly everywhere extended to the attempt to introduce appropriate vernacular names to the public, in the hope that they will he taken up by tree lovers and gradually estahlished, thus realizing the prophetic phrase of Sir Joseph D. Hooker: "Good English names for your noble western trees." J. G. LEMMON.

The Height of Douglass Firs.

Hon. Wm. Alvord of San Francisco, president of the American Forestry Association, was naturally put out a little by current newspaper statements that there are Douglass firs in Washington that are over 600 feet in height. Of course he did not believe it, and as will be seen hy the appended letter, one to whom he appealed for testimony, and who is an authority, says the statement is a great exaggeration. We are under ohligation to Mr. Alvord for the privilege of printing the following:

FRESNO, CAL., July 29, 1892.

William Harvey, Esq., Secretary Raisin Growers' Convention, Fresno, Cal.—DEAR SIR: I take pleasure in reporting to this convention that, pursuant to the call of the chairman, about 15 of the raisin packers of this county were together all of Monday last, in making minimum selling prices. For packed raisins, the f. o. b. prices finally agreed upon are as follows: Fancy layers, $2; 3 crown layers, $1.70; 2 crown layers, $1.50; fancy loose unfaced, $1.45; fancy loose faced, $1.50; 3 crown loose, hoxes, $1.35; 4 crown loose, sacked, 6½c; 3 crown loose, sacked, 5½c; 2 crown loose, sacked, 4c; seedless muscatel, 4½c.

These prices are based on 4½ cents for good raisins in the sweat hox. We have now the signatures of 22 packers, aggregating about 1,500,000 hoxes, and we have promise of several others that will sign the agreement adopted at the last State convention, and some have declined to sign it at all.

We are, however, hopeful that the required 95 per cent will be obtained, and to secure that desired end, a committee has been appointed consisting of G. B. Olufs, F. Romaine and G B. Nohle, to get such legal advice as may he necessary in drawing up a paper that will he hinding upon those packers who sign it.

It is further agreed that this committee shall either personally interview or correspond with those packers who have not yet signed the agreement, and ohtain from them their signatures, if possible, or in any event a definite statement of their attitude toward this movement.

I am, GEO. B. NOBLE, Chairman.

The New Silver Fields in Arizona.

WHITE HILLS, ARIZONA, Aug. 2, 1892.

TO THE EDITOR:—A short description of the new silver find at White Hills may interest such of your readers as have noted the recent sale of some of the leading prospects to San Francisco capitalists, for $200,000.

White Hills is north of Kingman, 50 miles, and the leads were discovered by Henry Schaefer in May last. The white hills from whence the camp is named, occur peculiarly in a range of black malapai, which is the country rock of this region. The hills are low, not more than hogbacks, running from the higher malapai hills to the Sacramento valley or rather desert. On the summit of each ridge extends a horse of porphyry, parallel to which, on each side, were found the broken ledges of wonderfully rich silver ore. All indications point toward a continuation of the ledges under the malapai debris of the valley. Old prospectors say that similar white hills are found among the malapai ranges all the way northward to Stone's Ferry on the Colorado, 35 miles from here. The intense heat now prevailing prevents prospectors from exploring the country, as animals succumb before water holes can be located.

Nothing whatever has heretofore been found in these barren ranges, which accounts for the easily-overlooked recent strike. The old road across the desert to Stone's Ferry and on to Pioche, passes within five miles and in sight of these hills. The surrounding country is desolate and barren of wood and water.

Over 60 claims have been located here, but outside of the 15 original discoveries nothing of a bonanza nature has been uncovered. Thirteen of the Schaefer claims were located in partnership with John P. Birnett and John L. Sullivan (not the Boston boy) and it is these claims which have just been sold. The sale is a proof of their remarkable richness when considered that none of them has a a hole dug over 30 feet. Following is a resume of each:

DEFIANCE.—South extension of the Garfield, 36 inches wide, all ledge matter assaying. A small batch at the Kingman sampling works milled 700 ounces.

GARFIELD.—The ledge is found broken on the surface 15 feet in width. It runs, at the east, into the G. A. R., making a tremendously strong lead, which can he traced hy bold croppings over 2000 feet. Ore milled $321 silver and $6.40 gold. All ore running less than $60 is left on the dump for the present, as freighting charges to Kingman preclude any profit. The shaft is down only 15 feet, where the pay streak is found 14 inches wide.

G. A. R.—This shows more rich ore than any mine in camp. The vein is over 35 feet wide on the surface, broken hadly and mixed with foreign matter. The shaft is down 25 feet. Rock running 1500 ounces is being sacked for shipment. Occasional streaks two and three inches wide are found, of pure horn silver and chloride.

CHIEF OF THE HILL.—Situated a mile north of the G. A. R., with no intervening float, this is the largest solid vein in camp. It has been already uncovered six feet without encountering the foot wall. Being in and across a wash, the ledge is partly covered with sediment, so that its extent is not yet known. Ore assayed over 2,500 ounces silver and some gold. Sulphurets are first found here.

OCCIDENT.—The little work done shows pay-streak three feet wide, the total width of ledge not yet discovered. The ore is of different character to those above described, owing to absence of manganese. Very rich in horn silver.

HORN SILVER.—Pay streak three feet, ledge full four feet. Shows more horn silver than any prospect. Shaft 20 feet.

The remaining seven locations—the Orient, Hillside, and others—are good, strong croppings, with no work done to speak of. Besides these, Judge Schaefer has the Norma and Treasure, individually, which are considered even richer than any of the partnership claims. Robert Patterson and partners have located the Prince Albert, Desert Prospect and other claims, which show the same character of rock and about the same richness.

Altogether, all mining men who have visited White Hills are astonished at the immense extent and richness of the strike. It is said to show more rich ore than Tombstone or Pioche in their Palmiest days.

The new purchasers have purchased a law-suit that has sprung up over the one-third interest sold by Sullivan to Wm. H. Lake and others over a bond he had previously executed in favor of Schaefer. This will probably delay the opening of this phenomenal camp, and hence it is advisable that miners and laborers looking for work should not yet come to White Hills. Prospectors, also, must wait for cooler weather and the rains before entering this region. A few months at most, however, it is confidently predicted, will show the extent of the present find and discover others that will attract the attention of the world to Arizona.

IRA E. BENNETT.

The Chick Process.

PITTSBURG, Kansas, July 28, 1892.

TO THE EDITOR:—Your issue of June 11, 1892, contains certain misstatements about the Chick process, and for your henefit I will give you some facts. In the first place, the Chick process was not discovered until the fall of 1889. The furnace and machinery used in the Chick process was not patented until 1891. The first plant huilt using the Chick process was built in 1891, and commenced operations in the fall of 1891, which has been continuous and successful ever since, as hundreds of its stockholders will testify, as they have received in dlvidends of $25,000, just one-half the cost of the plant.

The stock in this company at Pittsburg sold at $50 per share, but is now held and some little sold at $250 per share. This plant has just doubled its capacity, and is running night and day on dry hase and working some 99 per cent of its assay value without flux. A 50 ton plant using this process can work any base ore up to 99 per cent

of its assay value, at an expense not to exceed $2 per ton.

I enclose you a cut of the works now at Pittsburg, and should you visit the East, please call aod see for yourself the finest plant west of Chicago. There are six plants in course of construction now in different parts nf the United States that will use this process, and there will be one in California in the near future if the terms for California are complied with.

We challenge the world to show a process that will work the class of ore that we are now working up to 99 per cent of its assay value without flux. Yours truly,

G. HORATIO CHICK.

Electric Power for Mining in Nevada County.

The day is not far distant when electric power for mining purposes will be introduced into the Nevada and Grass Val'ey districts, says the Grass Valley *Union*. The plans for such an enterprise have been in formation for some time by Mr. Alf. Tregidgo, president of the County Miners' Association, who has acquired a valuable water right on the South Yuba, rights of way for a canal, and lines of electric wires, and the necessary stations for the dynamo plants. Several of the principal electrical companies have been bidding against each other for furnishing the dynamos, and there are men of capital who are desirous of he coming interested in the company that will undertake the the carrying out of the enterprise, as it is evident that it would soon be an important factor in furnishing power to run mining machioery in the districts named, and would be a valuable investment, as once the plant was established, the expense of maintaining it in efficiency would he comparatively light. The South Yuba river, at its lowest summer stage, furnishes 2500 inches of water, which will insure whatever water is required, and this will be conveyed by canal for a distance of about four miles, and then dropped to a station on the bank of the river, giving a pressure of 400 feet to drive the dynamos. This point would be only three miles north of Nevada City and only seven miles from Grass Valley, and therefore the loss of power by transmission would not be great. The advantage of the location of the entire plant would be that it is helow the snow line, and could not he obstructed by the snow fall at any time. Neither would there be any loss of water, as whatever was taken out of the river by the canal would be returned again. The location of the canal will be near the Purdon bridge on the South Yuba, and the canal will be constructed on the south side of the river. It will be made of sufficient capacity to carry 6000 inches of water, with a view to meeting the largest demands for power in the future for whatever purpose. The scheme is in all respects practicable, and can be carried into successful operation at a reasonable cost. The location is not surpassed by any in the State, and possesses the great advantage of furnishing ample power in a short distance for mining and other purposes. This valuable power has heretofore been running to waste, and its utilization cannot but exert a very beneficial influence on mining and other industries in the central portion of Nevada county. It is purposed to commence work on this valuahle improvement the present season. In a few weeks further details of the scheme will be made public.

As the vintage season for the year is nearly at hand, the wine makers of the State are again confronted with the question of storage room. They must sell their stock to make room for this season's wine or provide additional cooperage. The wine product was short last year and will be this; but the wholesale men do not want to pay figures which the makers consider fair. They are counting on the wine makers having to sell to make room for the new crop. The St. Helena *Star* (Napa Co.) says there is only one way to overcome this state of affairs. The problem of cheap storage has been solved, and is now in operation by several large wine makers. Instead of securing small cooperage to be lodged in large and costly edifices, therehy adding to the cost of the wines, they have hegun by obtaining cooperage at a low rate, the building heing an after consideration. They first order large tanks from 12 to 15 feet high and from 14 to 16 feet in diameter, capable of holding from 14,000 to 20,000 gallons each. These tanks are sent from San Francisco, carried to their destination and set up in place by competent men at a total cost to the purchaser of 1¼ to 1½ cents per gallon. When these tanks are set up in the place, they may be inclosed in a cheap frame building which will he sufficient for all purposes. Heretofore they were obliged to pay 2½ to 3 cents per gallon for the privilege of storing their wine in cooperage belonging to another man and in another man's cellar, together with the incidental expenses of drayage, gauging, watching, etc. By following the process mentioned, storage costs 1½ cents a gallon at a maximum for the first year, the wine is always under the maker's own supervision, and the cooperage is his own. When the San Francisco wholesaler sees that the wine makers are independent, and not obliged to rid themselves of their old stock to make room for new, he will be less disposed to treat them like beggars and impress upon their minds that without his good wishes they must starve.

THE Virginia *Chronicle* says: "The suspension of the ore product in the Yellow Jacket, Crown Point and Belcher mines does not constitute a complete shut-down of those mines, as many were inclined to consider. Official sources state it to be a temporary lay-off of the men employed in ore extraction for milling. About a dozen men are still employed underground in the Yellow Jacket, twice as many in the Cruwn Point and 20 in the Belcher, all engaged in prospecting and regular development work, and advantage is being taken of the situation to overhaul the machinery of the surface works and put things in proper shape after the long and incessant run of the last year or two. The present low stage of water in the Carson river gives the opportunity, therefore the mills also are similarly shut down and undergoing necessary repairs.

Cheap Power for Mills and Factories.

The great natural water power produced by the fall of Feather river at the Golden Feather dam, says the Oroville *Register*, will certainly be utilized in the next year or two if a transcontinental railroad is constructed through Beckwith Pass and down either fork of Feather river. This splendid natural power fnr manufacturing purposes will not lie idle and unused, for there is hardly a rival of such power in our whole State. At a narrow gorge in the Feather about two miles ahove Oroville, a high rock projects into the stream on the south side and a point of Table mountain on the north side. At this natnral site the Golden Feather Co. has constructed a strong and durahle dam built in the most permanent and lasting manner, to turn the water of the river into a gigantic masonry canal. The flow of water over this dam, or from the mouth of the canal back into the main stream, will afford a cheap and convenient water power for manufacturing purposes. Here mills and factories can be located, with ample room for yards and grounds, while the power for running machinery can readily be transmitted by electricity from the Golden Feather dam. The height of the dam is over 30 feet, and according to State Engineer Hall, the flow of water in midsummer in the Feather is 1200 cubic feet per second, which will give a vast power for the purposes indicated. During eight months of the year, or when the water is high, this power would be of course greatly increased. Manufacturing in other towns has built them up, caused an influx of capital, and added to their wealth and population. Manufacturing is to-day greatly needed in this State, for we have hitherto shipped our raw products and received in exchange the manufactured goods of Eastern towns and cities that have grown rich at our expense.

The water power created by the Golden Feather dam points out that Oroville is destined to become a noted manufacturing center. Cheap water power has created on other rivers great cities and huilt up extensive manufacturing establishments. In the vicinity of Oroville a vast quantity of fruit has been planted, and it is probable that within a few years extensive fruit canneries will he established at Oroville, Thermalito and Palermo. The day is not far off when the valuable beds of clay, of iron and coal will be opened and developed in this vicinity. It is probable that ramie will he grown upon the river hottoms and manufactured into various materials. The great forests that now cover the mountains along the Middle and North Fork of the Feather will be used in lumber, boxes, sash, doors, etc. This will give rise to extensive factories near where the cheap water power is created.

It is likely the day will come when tanneries and woolen mills will be in operation at this point, and with cheap and permanent water power for manufacturing, it is within the bounds of probability that Oroville within a dozen years will become a noted manufacturing center. This splendid water will not lie disused for any great time. The energetic manager of the company, Colonel Frank McLaughlin, is a clear-headed and shrewd business man. He is largely engaged in the planting of fruit, especially the orange and olive. Olive mills must be erected, and the power most cheaply obtained is that from the great dam of the Golden Feather. A hundred possibilities loom up before us, and all that is needed to draw hither capital and to establish manufactories is to make known the advantages that we have to present. The only way that this can be done is to thoroughly advertise our town and let others know what is open and apparent to us all in this vicinity.

One Way of Mining.

The Palmarejo Mining Co., Limited, may be cited as an example of how not to work a mine, says the *Arizona Herald*. The company owns mining property in western Chihuahua and was launched on the London market in 1886 by promoters who had made an unfavorable record in the Eherhardt mines of Nevada. These promoters received £200,000 cash and £100,000 of fully paid stock, of which the owner is said to have received less than $500,000. The mines were not new; they had been examined many times by American engineers, who had refused their purchase for less than $300,000. However, the English company was persuaded by the glowing report of its experts, not only to huy the mine, hut to suhscribe a working capital of £100,000. It was determined to build a mill, but when the ground was examined it was found that it would have to be located some 30 miles from the mine, where water could be obtained. This was apparently unexpected, and as the ore would not bear transportation expenses if carried on mules, the building of a railroad was suggested and £150,000 was suhscribed to the Mexican Mineral Railway, the Palmarejo Co. guaranteeing the new company 7 per cent interest on its bonds and an 8 per cent stock dividend. The railway was commenced, as was a water ditch, and the construction of a mill was resumed. Soon the latter was stopped for lack of funds, and the company had to issue debentures amounting ultimately to £150,000 before it could he completed. These were subscribed to by the stockholders, who were receiving favorable reports of the developments in the mine.

Finally the auspicious day came last April, when the railroad was completed, the mill built and the ditch ready for the water when, unfortunately for the patient English stockholders who had subscribed £600,000 in anticipation of success, there was enough water to run five stamps only, and of course, as funds are exhausted, there are further calls for money. The railroad itself was s complete failure, a fact that caused no surprise to any one who had seen it, for its grades were so heavy that it required two locomotives to haul one car of ore.

During this time the company had no less than three general managers and scores of suhordinates. The promoters claimed an average value of £30 per ton for the ore, which is just about double the estimates of many responsible experts. The prospects of the mine ever paying its dehts, or the stockholders ever getting anything, are extremely remote. If English investors in general would profit by this expensive lesson, it might he some satisfaction to those who had lost their money to feel that it was a philanthropical investment for the good of their fellow countrymen. Unfortunately, however, the crop of food is perennial and the supply is never exhausted. Or, to put it less brutally, the English investors in mines display an amount of blind, unquestioning faith which, if better directed, would surely secure the canonization of a large propurtion of Carlyle's "forty millions."

Southern Arizona as a Gold Producer.

So far in the history of the metallic output of Cochise, says the Tombstone *Epitaph*, gold has not cut a very conspicuous figure, not because it does not exist, but its development has not been fostered. Here in Tombstone a few million dollars' worth has been extracted, because it was found with the silver, and later in the history of the camp increased percentage with depth demonstrates that the output ot his metal will be immense. But aside from this camp,c ontiguous thereto we have specially defined gold belts that are certain to become great producers. The one that has received the most attention in the Dos Cabezas end of the Chiricahuas is a giant that gives sufficient showing to warrant the assertion that with a very much smaller outlay in plant and development than has been accorded the Father DeSmet group it would be a handsome and constant dividend payer. But it needs coin and plenty of it—enough at least to establish large mills eight or nine miles west of the mines where water is abundant, to he connected with a railroad, that the ores may be cheaply handled. Continuing down the range toward Sonora, gold ledges undeveloped can be found as far south as Silver creek. In the Antelope camp, adjacent to town, gold-bearing quartz can be found on almost every hill. A few prospect shafts have been sunk, but no special depth has been attained and crosscut prospecting for main depnsits is hardly shown. Speaking of this district, in the early days of our camp one of our citizens, desirous of opening up a claim he had, offered one-half interest for a 50-foot shaft on the property. The shaft was not sunk, but one party that examined the claim noticed three large granite boulders lying in a row on the surface. Breaking the crust of one of these it was brought in and found to assay $831 in gold. As this claim was close to the foothills of the Dragoons, and as the immense dyke that runs from Silver Cloud to South Pass, in view of town, gives colors on the surface, there is a field here that is well worth thorough prospecting.

To the south of Tombstone the Huachuca range, though long decried by many of limited knowledge as to its resources, is a perfect giant of a future producer. From the summit between Ash, Montezuma and Copper canyons, clear through to the reservation at the post, there is an almost unbroken belt of gold quartz. The "Sampson," in Copper canyon, owned by A. Barron and others, and now under bond for $50,000, at an elevation of 7000 feet, just under the pine belt, with wood and water in abundance, shows a ledge of from 4 to 6 feet in width, cropping up some places 30 feet above the ground, that on a careful estimate will average over $14 to the ton. This ledge is helieved to be the same that crosses the divide between Cave Creek canyon and Ramsey. There are a numher of gold claims in this helt that deserve special mention, not only for merit but for development under adverse circumstances of owners, but space will not permit. High-grade zinc, copper and lead ore have also been found in these mountains in strong ledges and deposits.

A PETITION is being circulated among the members of the San Francisco Stock Exchange in support of the resolution recently introduced in executive session to do away with the life assurance which the members' seats now carry. The movement meets with considerable opposition among the poorer class of brokers, who view it in the light of an attempt to depreciate the value of their seats. On the other side, it is argued that, owing to the fact that the fund is now depleted to the extent of one death payment, assessments would have to be levied to meet any further contingencies, all of which would have to he borne by the wealthier members. There are not so many of this class in the board just now, and besides, the present condition of business is not such as to warrant the expectation that the minority would feel inclined to pay more than their own pro rata of the amount required.

Reviewing the State as a whole, there are 40 counties out of a total of 54 that are engaged in preparing exhihits of their products for the World's Columbian Exposition that opens at Chicago on May 1, 1893. A few of the counties that are at work have not formed local World's Fair Associations, but such counties are included in one of the three district associations in the State, and the preparation of exhihits is in progress through other organized bodies or through prominent individuals. In 32 counties of the 40 there are regularly organized World's Fair Associations, and with but few exceptions the collecting and preparing of displays is proceeding systematically and with a satisfactory degree of rapidity.

M. W FOX, who was the plaintiff in the suit against the Hale & Norcross Mining Company, has notified the directors of the Savage Mining Company that he will agree to mill Savage ores for one year at $3.50 per ton. He requires that the ores shall be delivered at the mill he shall designate at the company's expense, and agrees to return in bullion not less than 65 per cent of the car-sample assays of all ores of not less value than $20 per ton.

THE Savage mine directors have appointed a committee to call upon the officers of the Chollar, Potosi and Hale & Norcross, and to invite the companies to join with the Savage in the purchase of a mill. The Hale & Norcross has declined, on the ground that it is not in a financial position to advance funds for such a purpose, and that all the available funds are necessary for exploration purposes.

MECHANICAL PROGRESS.

A Brief Fire-Engine History.

It was not until 1860 that steam fire engines came into general use, although floating fire engines had been used on the Thames for some years. In 1863 an account was published in the London *Times* of a competitive test between Englisb and American steam fire engines, prizes of £250 and £100 being offered for the best and secood best. The result was very much in favor of the old country engines, though the American ones certainly had many strokes of ill luck. Tbe Manhattan collided witb a tree and was badly damaged before it reached the competition grounds, and the other American engine, Alexander, broke its cylinder cover at the trial. If such a contest were arranged to-day, the odds would all be in favor of the machines built in this country, and no one would doubt this for a moment.

In principle all the fire engines are alike, whether worked by hand or steam. With the steam engine lies the advantage of continued action, much greater power and the supply of water at greater heights. No effort is made to economize steam in a fire engine. The main objects aimed at are the rapid generation of steam and its maintenance at a high pressure, ranging from 80 to 100 pounds to the square inch. A modern engine may be said to consist of three parts: A powerful coil of tubular upright boiler, the engine, pumps, air-chamber and the carriage. The greatest attention is paid to making the machinery very strong and very simple. Complicated valve gearing is not to be thought of. Every portion must be in a position where it can be easily reached and the parts must be such that they can be duplicated speedily. Ao average fire engine for use in a large city will have cylinders from six to eight inches in diameter and pumps from three and a half to four and a half inches in diameter, the stroke of both averaging about eight inches. All the larger engines are double, as, though each pump is double-acting, that is to say, delivers on both the up and down stroke, a steadier stream is supplied from double pumps.

The capacity of the largest engines is 800 gallons a minute; the average, though, is not over 600 gallons. The weight of an engine ranges from 7000 to 8000 pounds, and it will be understood that the very best and strongest workmanship is necessary to withstand the unavoidable rough usage incident to a hurried journey over vile pavements. The fire under the engine is lighted automatically, and as the water in the boiler is kept hot by coonection with sanitary boilers at the engine houses, the necessary pressure is attained in a few minutes at the utmost.

There are probably half a dozeo makes of fire engines in the United States, all of which rank as first class. It would be a very difficult matter to select the best, while to take the verdict of firemen would also amount to little, for men who have run all their lives with a particular kind of engine can see very little virtue in those of any other make. Some cities use almost exclusively one make of engine, and others are just as conservative in the use of aoother make.—Fire and Water.

How to File a Saw.

Every person should have a crosscut saw and a ripsaw, and should know how to file both. He will need a three-cornered file aod a couple of straight-edged boards, two or three inches wide and about the length of the saw, between which to clamp the saw in position firmly while being sharpened. The principle of sawing is the same as cutting. In ripping, the teeth act like a series of chisels, and should conform to a chisel shape as nearly as is consistent with the proper strength at the base of the tooth. The teeth of ripsaws are filed straight across the blade from every way, thus giving an entirely level and straight front to the tooth

The filing of crosscut saws is more difficult than ripsaws, at least to the amateur, as they are filed at an angle both horizontally and perpendicularly, and the set, or pitch, of the tooth must be governed by the hardness of the wood to be sawed. The softer the wood, the steeper the forward pitch of the tooth may be. In this form, the sides and base of the tooth are equally long. This gives the base of the tooth the strength to resist the pressure of the hardest woods. The hardness of the wood has also to do with the size of the teeth, as the harder the wood, the smaller the teeth must be in the same style of saw. The set of the tooth may be given fairly well, by a careful hand, by tapping each tooth with a hammer and punch as it lies flat on the end of a hard wood block, but it is best administered by one of the many good saw-sets in use. The width of the set is governed by the softness or sponginess of the wood. Elastic wood, such as willow, requires a very wide set. Give in no instance more set than is required to make the saw run easily, as all beyond this demands extra and useless effort, besides wasting the timber.—Farm and Home.

Rapid Transit.

It is estimated that a practical rapid transit system for the city of New York will require a carrying capacity of 150,000 passengers per hour io one direction. Louis Heilprin, a writer in the *Engineering Magazine*, says that the plans of the rapid transit commissioners are inadequate, and he points out that to adopt any other system than one which would give rapid transit would be only preparing tbe way for new complications in the future. Mr. Heilprin says: "This idea of compressing the traffic into a four-track main artery under Broadway for a distance of two miles and a balf is simply preposterous." Continuing, he says: "If eight underground tracks are needed above Fourteenth street, it is absurd to imagine that four will suffice for the remainder of the distance. But the idea of having only four tracks for these two and a half miles evidently has its root in the notion that the great underground thoroughfare ought to be, as far as possible, directly under Broad way. It is true tbat more than four parallel tracks cannot be located on the same level under Broadway without descending to a greater depth than the commission considers admissible. But is there any absolute necessity for locating the underground road precisely on the line of this thoroughfare? Better travel in comfort under the Bowery or South Fi'th avenue than be packed like herrings under the esthetic blocks of Broadway buildings. It might be well, indeed, for the east and west lines to converge somewhere in the vicinity of Union square, so as to meet in a capacious transfer station, which would permit passengers from the east side passing over to the west side and vice versa; but after thus meeting, the two roads ought to diverge again and pursue an independent course to the extremity of the island, from a quarter to an eighth of a mile on either side of Broadway." Mr. Heilprin is not an enthusiastic advocate of the underground plan, but seems to be convinced that it is the plan most liable to be adopted. This only adds to his desire to have real rapid transit, combining all the comforts of high-speed transportation and eliminating as far as possible the discomforts of travel through tunnels."

STEEL OR IRON TUBES.—At the Saratoga Convention of Master Mechanics' Association, a committee made the following report on steel vs. iron tubes: "The informatioo as to the relative merits of steel and iron for boiler tubes has excited considerable discussion, but your committee has very little definite information to present. We are, however, advised tbat in the case of a large number of steel tubes tbe results, so far as wear is concerned, have been unfavorable. The following definite experiment, however, bas been made: An engine was equipped with 114 iron tubes and 113 steel tubes on December 20, 1890. The iron tubes were placed on one side of the center and the steel tubes on the other side of the center of the boiler, the tubes being divided by a vertical line through the ceoter of the flue sheet. On March 9, 1892, the flues were all removed. Seventeen of the iron tubes were condemned on account of pitting and corrosion, while 64 of the steel tubes were condemned of the same defect. This would indicate that steel tubes are more affected by corrosion than iron ones. Further experiments and information in this line, however, are desirable in order to fully settle this question."

NEW LOCK NUT.—A new lock nut is being put upon the English market. It consists, says *Industries*, of a coiled spring made of steel of a suitable section so tbat the coils lie closely together. The interior of the coils is screwed to suit the bolt on which it is placed, and the exterior shaped to a square, hexagon or other convenieot form. The idea upon which the nut is based is the constant tendency which exists for tbe coil to press upon the threads with sufficient force to bind the nut firmly upon the bolt. Any pressure or jar upon the last two or three coils which are in contact with the surface to be fastened leads to an immediate locking of the nut which is very effectual. It is stated that the nut can be supplied at a low rate.

PACIFIC ROLLING MILL CO.,
.....MANUFACTURERS OF.....
Cast Steel Castings and Steel Forgings
UP TO 20,000 LBS. WEIGHT.
True to pattern and superior in strength, toughness and durability to Cast or Wrought Iron in any position or for any service.
GEARINGS, SHOES, DIES, CAMS, TAPPETS, PISTON-HEADS, RAILROAD and MACHINERY CASTINGS of Every Description.
— ALSO —
HOMOGENEOUS STEEL, SOFT and DUCTILE, SUPERIOR TO IRON FOR LOCOMOTIVE AND MARINE FORGINGS.
ALSO Steel Rods, from ¼ to 3 inch diameter and Flats from 1 to 8 inch. Angles, Tees, Channels and other shape Steel Wagon, Buggy, and Truck Tires, Plow Steel; Machinery and Special Shape Steel to size and lengths STEEL RAILS from 12 to 45 pounds per yard. ALSO, Railroad and Merchant Iron, Rolled Beams, Angle, Channel, and T Iron, Bridge and Machine Bolts, Lag Screws, Nuts, Washers, Ship and Boat Spikes; Steamboat Shafts, Cranks, Pistons, Connecting Rods, etc. Car and Locomotive Axles and Frames, and Iron Forgings of all kinds; Iron and Steel Bridge and Roof Work a Specialty.
HIGHEST PRICE PAID FOR SCRAP IRON AND STEEL.
☞ Orders will have prompt attention. Send for Catalogues. Address

A Valuable and Original American Book on the Manufacture of Leather.

DAVIS'S MANUFACTURE OF LEATHER.

The Manufacture of Leather, being a description of all the Processes for the Tanning, Tawing, Currying, Finishing and Dyeing of every kind of Leather, including the various Raw Materials and Methods for Determining their Values; the Tools, Machines, and all details of importance connected with an intelligent and profitable prosecution of the Art, with special reference to the best American Practice. To which are added Complete Lists of all American Patents for Materials, Processes, Tools and Machines for Tanning, Currying, etc. By Charles Thomas Davis. Illustrated by 302 engravings and 12 samples of Dyed Leathers. 8vo. 824 pages.

Price $10, free of postage to any address in the world.

☞ *A large illustrated circular of this book, 8 pages, 4to, showing the contents, will be sent free to any one in any part of the world who will furnish his address.*

☞ *Our New and Enlarged Catalogue of Practical and Scientific Books, 88 pages, 8vo, and our other catalogues, the whole covering every branch of Science applied to the Arts, sent free, and free of postage, to any one in any part of the world who will furnish us with his address.*

SCIENTIFIC PROGRESS.

Sponges.

Whether a sponge is to be classed as an animal or a vegetable is still a much disputed question. The sponges which you use do not seem to have much life in them, do they? And they certainly do not look much like any animal with which you are familiar. Yet these sponges are hatched from tiny eggs thrown off every spring by the parent sponge, and these atoms grow by and by to be big sponges like their mother. And although wise men have not quite agreed upon the subject, most of them have decided that sponges do belong to the lowest form of animal life, just one small step above the vegetable.

And these sponges are found of all sizes, from the small specks—the baby ones, you know—up to the huge fellows of three or four feet high. When the sponges are first batched, they spend a couple of days floating about in the water. Then they proceed to attach themselves to rock or shells, or any convenient place, where they hold on fast and grow bigger and bigger all the rest of their lives, or until some sponge fisher comes along with a big knife or a long fork and cuts or tears them from their resting-place.

Sponges are obtained in various ways, and in many different places in the world. Large quantities are found in the Mediterranean and the Red seas. Many are got in the Gulf of Mexico, and a long paper has been furnished lately to the State Department showing the great extent and value of the sponge trade of the Bahama islands.

In the Bahamas the sponge trade is an important industry. Very large numbers of people are employed in these islands in the work of gathering the sponges, handling them, clipping, washing and preparing them for market. From 5000 to 6000 persons are usually engaged, most of them, excepting the ship owners, brokers and shippers, being natives—black men.

Sponges are found either in shallow or deep water. In shallow water they are dragged off the rocks by a three-pronged fork with a long handle. The finest and most valuable sponges are found in deeper water, and divers go down to obtain them. The diver cuts them off from the rock carefully, being particular not to tear them. These are the most expensive sponges.

The amount of money made by the men who gather the sponges depends entirely upon the number they get. The work is very laborious, the prices paid are low, and the sponge gatherer who makes over $300 a year is a rare exception. The men who do the work on land of getting the sponges ready for market are paid about 50 to 75 cents per day, so it is not likely they amass a large fortune at the business.

Around these islands about 500 small vessels are employed in the trade. These vessels, being filled with the men who do the work, cruise about until they have gathered and prepared a good cargo of sponges.

The usual method employed in the Bahamas is by the fork or hook, such as is used in the East. At one time dredges were introduced, but their use has lately been discontinued. The dredge was found to break off and destroy the young and unsalable sponges, killing the spawn and working great mischief. These smaller sponges are never taken, but are allowed to remain and grow to a large size. An act was passed forbidding the use of dredges.

Great care is taken to protect the cultivation of sponges. The industry is of great value to the natives.

A sponge seems a little thing. It is like many another trifle, to which we have become so used that we no longer think of them as luxuries—more as necessities.

Yet their service to us involves the labor of thousands of people in far-away countries—people who supply their own needs and those of their families from their labor on these little things.—N. Y. World.

NICKEL AND FERRO-NICKEL.—According to a patent of Garnier, crude nickel, with basic flux of magnesia, calcined dolomite or chromic iron ore is melted in a water-jacket furnace with a hot blast. Silica and arsenic can be almost entirely removed by blowing air through the molten metal. For this purpose the tuyers are arranged in series one above the other. Then the remainder is so manipulated that the nickel alloy and slag run out simultaneously into a Gore's hearth, under the influence of the blast. The flux for refining iron or copper consists of coke and a mixture of 75 per cent bases (chalk, magnesia, and barytes) and 25 per cent feldspar or salt. The resulting alloy is free from nonmetallic elements. If nickel steel is required this alloy is remelted in a Siemens or Bessemer converter, or according to the crucible method. Pure nickel is prepared from the iron alloy by strong oxidizing action in a charcoal refining furnace or upon an open hearth furnace. Converters can also be used for this purpose. After the last traces of iron are blown out, the nickel always contains oxygen, which must be removed by the reducing action of manganese, magnesium, aluminium or zinc, added in the form of nickel alloy.

METRIC SYSTEM.—The New Decimal Association, whose headquarters are at Botolph House, Eastcheap, says the *London Daily Graphic*, has memorialized the Lords of the Committee of Council on Education on the desirability of taking an important step in connection with the introduction of the metric system in this country. The May examinations of the Science and Art Department are known through the length and breadth of the land, and much has been done by means of these examinations to popularize and extend technical study. The memorial which has been presented recommends that in certain of the science examinations alternative questions be given in future, based on the metric system of measurement, which may be taken at the option of the candidate in lieu of questions based on feet and inches. In this way the large and intelligent class of candidates for certificates of the department will be induced to learn the metric system. The Committee of Council on Education has already ordered that the principles of this system should be taught in the higher standards of all elementary schools; and one of the steps taken by the school boards of London and other towns, in consequence of this order, has been to furnish the pupil teachers and advanced scholars with boxwood rules having a decimalized inch scale and a metric scale in juxtaposition. In addition to this, colored wall-charts of the metric weights and measures are used, and in this way the rising generation will, to a great extent, be prepared for the introduction of these weights and measnres in future.

PREVENTING COAL DUST EXPLOSIONS.—In some of the German mines a new method has been successfully introduced for preventing coal dust explosions, in place of the usual practice of sprinkling water in dusty parts of the mine, this plan having only a limited utility, as the dust is generated by the breaking down of coal, and explosions may arise from the liberation of gases at the same instant. To meet these circumstances, the use of water has had an entirely new application, and with a result remarkably satisfactory. Holes of 1 metre deep are drilled at a distance from each other of about 3 meters, wooden plugs are inserted, and through them iron pipes from ¾ to 1 meter long, with openings between 2½ and 3 millimeters large, and connected with a rubber hose. It appears that in the Camphausen colliery a pressure of from 8 to 10 atmospheres and injection through two tubes in eight hours proved sufficient to impregnate 6 by 1 by 1½ meters, and in another case, that of the Kreuzgraben colliery, the water forced in under a pressure of 20 atmospheres during 16 hours moistened thoroughly the coal as far as four meters above the highest hole. In carrying out this method, primary regard is to be paid to the water pressure obtainable, the quantity of water injected and the firmness of the seam, the latter depending somewhat on the size of the coal pillars in the workings.

ALUMINIUM YACHTS.—The use of aluminium in the construction of sailing yachts offers, a naval authority considers, great advantages over the employment of wood and iron. Boats built of aluminium possess, he says, considerably greater stability than those constructed of the usual materials. He especially recommends the metal where vessels of fine lines and light draught, development great speed, are required. Estimating the price of a wooden or iron yacht of ten tons at £420, the same vessel. built of aluminium, would, this authority calculates, cost about £1,050. But the hull of the last named boat would, be argues, be as good as ever at the end of ten years, while the constructive materials of the wooden or iron vessel would be much deteriorated. Besides, he concludes, as time proceeds the price of aluminium will doubtless suffer by no means unimportant reductions.

AN English firm has invented an ingenious device for turning on the currents for electric lamps at a certain hour. An ordinary clock is so adjusted that at the desired moment a spring is released, permitting a pair of pivoted contacts to fall into mercury cups, thus completing the circuit.

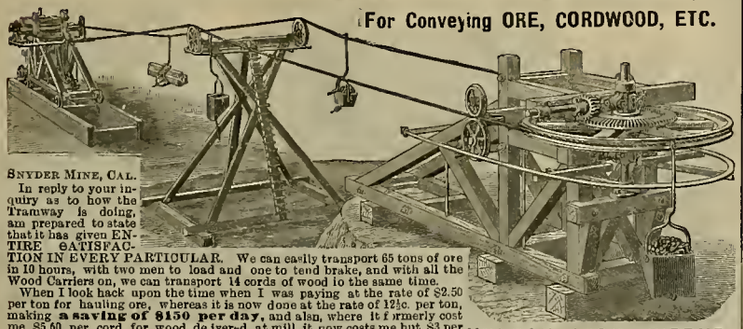
VULCAN WIRE ROPEWAY,

For Conveying ORE, CORDWOOD, ETC.



SNYDER MINE, CAL.

In reply to your inquiry as to how the Tramway is doing, am prepared to state that it has given ENTIRE SATISFACTION IN EVERY PARTICULAR. We can easily transport 65 tons of ore in 10 hours, with two men to load and one to tend brake, and with all the Wood Carriers on, we can transport 14 cords of wood in the same time.

When I look back upon the time when I was paying at the rate of $2.50 per ton for hauling ore, whereas it is now done at the rate of 12½c. per ton, making **a saving of $150 per day**, and also, where it formerly cost me $5.50 per cord for wood delivered at mill, it now costs me but $3 per cord, making a saving of $2.50 per cord—I may say that I feel pretty well over my Tramway investment for it is a PERFECT SUCCESS.

ELECTRICITY.

Electrical Development.

We of to-day are very apt to think that whatever of advancement and progress has beeo made is due to our own inventive ability, but as a matter of fact, there are very few of the inventions of the present time that can be called new, except in the details of their construction and use. The development of electricity began centuries ago, its adaptation to mechanical uses being the only part for which we can claim any credit, says the *Manufacturers' Gazette*.

Electricity has always existed since the beginning of time, and can only be considered as in the light of a discovery, invention being only applicable to the uses to which it has been put in connection with mechanical and other devices.

Neither are we able to trace it to the original discoverer or his time, which may have been and probably was many years before the time of which we have any authentic history on these subjects; but the first man of whom history tells in connection with its discovery was Thales, about the year 600 B. C., who first relates of the action of of amber when rubbed, in showing the properties of electricity as known at the present time. Thales made many experiments, and began the development, which was followed up by Theophrastus, 321 B. C., and Pliny, 70 B. C., each of whom succeeded in still further developing its properties, and they speak of the power of rubbed amber to attract dry leaves and straw. In following up the subject, they also found other objects possessing the same powers. Among these were tourmaline and the torpedo. Both Plioy and Aristotle speak of the power of the torpedo on animal matter, and of the effects by contact with it.

This power was knowo to the ancients, a proof of which is given in the fact that there are accounts of wonderful cures effected by this agency. Anthero, a freedman of Tiberius, was cured of the gout by contact with and shocks received from the torpedo, and there are many other instances in ancieot history of a similar nature.

Malineer, king of the Greeks, seems to have been a wonderful character, and if alive at the present time would be considered quite in the line of a "curiosity," as he was able to emit sparks of electricity from his body.

We believe that Dr. Gilbert of Colchester is acknowledged as being the founder of the science, he having made it a study, and experimented with different substances to determine if they possessed the same properties. He wrote several treatises upon the subject, and did much to bring it more prominently into notice, and to lay the foundations for further developments.

Robert Boyle was another of the earlier experimenters and workers upon this subject, who assisted extensively in developing this active agent and applying it to man's usefulness.

It is impossible in so brief a space to mention all the wonders accomplished, in the experiments made with this force, or even to trace many of them to their originators, as, for instance, the first discovery or production of the mariner's compass, dating back over 2000 years B. C., and having its origin probably among the Chinese.

Coming down to the time of Galvani and Sir Humphrey Davy io the 18th century, we find more correct accounts, and how it was more generally understood. Between Galvani and his friend Volta the discovery of a new element in electricity was made and developed, each of whom gave their names to their discoveries, by which they are known to-day.

Sir Humphrey Davy was undoubtedly the first to attempt lighting by electricity. By the aid of 2000 Voltaic cells, he succeeded in producing a light. The excitement and strain upon his mind caused by this and other successful achievements, is said to have thrown him into a fever, which came near proving fatal.

The scientific men of those times had, by experiments, arrived at the conclusion that there was some connection between magnetism and electricity, and this missing link was at last discovered by the son of a Danish apothecary by the name of Oersted, and on this discovery rests the entire theory of electro-dynamics. This opened up a new source for experiments and inventions.

The discovery of the lines of force surrounding magnetic bodies was made by Michael Faraday, an English blacksmith. This was the greatest discovery yet made, and on this discovery rested the theory of dynamical electric machines. Faraday brought out many new ideas and made for himself a lasting name.

This brings us down to the time, since which most of us are familiar with the wonderful developments of the past few years, and the various devices which have been made to utilize this powerful agent.

There has been no discovery ever made which has developed into such magnitude, or proved more successful than that of electricity, and yet it is apparently only in its infancy so far as what it is capable of, as every-day results show, and we may yet live to see it the great motive, lighting, heating and mechanical agent of the world.

High Speed Train Resistance.

The subject of increasing the speed of railroad trains by using rotary electric motors in place of the present reciprocating steam motors, which is daily growiog to be more and more important, involves a koowledge of the train resistance at such high speeds. As theory is of little aid, we have to depend almost entirely on existiog experimental data, which, however, is unfortunately very scarce and not free from errors. In order to arrive at a good mean result for use in such calculations, our contemporary, *Engineering News*, in an able article compiles all the best existing data, makes some corrections and then plots them. From this set of plotted results a general law is then deduced by giving more or less weight to the various data, in proportion to their probable correctness. By this process, which is the only proper way to attack this problem, is obtained what is probably the nearest approach to the true rate of train resistance in pounds per ton that existing data enable one to deduce. The result, therefore, is of considerable interest to those working in this field, especially as it shows that the generally accepted assumption which states that the resistance iocreases with the square of the velocity, is probably incorrect. For steam locomotives, to which this article refers, there is a factor which enters ioto this total resistance, namely, the resistance due to oscillations and concussions, which certainly is quite considerable at high speeds, and if included in the total train resistance would doubtless make it increase more rapidly with the speed. But for electrical traction, in which there is only rotary motion, this factor in the total resistance becomes very much smaller, because a steam locomotive expends much energy in trying continually to get off the track, to spread the rails, to pound down the roadbed and to twist its frame. Although not pointed out in the article of our contemporary, yet it appears to us that the formulæ for electrical traction ought therefore to give lower results at high speeds than those for steam engine traction. The relative positions of the plotted values obtained for steam traction and those of Crosby made with electrical motors, seem to show this, as the latter form the extreme on one side of the mean. The results arrived at in this article, which refers to reciprocating steam motors rather than to electrical rotary motors, are that the train resistance is equal to one-quarter of the velocity plus two. This is certainly a very simple formula, and it would be very gratifying to find that it was correct. Further developments io this field may give different results, but until other experiments are made this formula may doubtless be used as the best one existihg at present.—Electrical World.

TANNING.—The application of electricty to tanning on a commercial scale is reported to be making quite extensive progress says the *Engineering News*. Although often spoken of as tanning by electricity, it is really tanning with electricity. The tanning process consists in a chemical union between the tannic acid from the bark, or other tanning agent, aod the gelatine of the hide. As ordinarily carried out the process is a slow one, requiring from a few weeks to a year, or more, for the proper treatment of the skins. The application of the electric current is claimed to greatly expedite the process, so that two to four days suffice to complete the tanning after the skins are made ready for action by the tanning liquor. Various theories are proposed to account for the action of the electric current in this case, but the well known effect of the current in inducing chemical action is sufficient to show that the process has really a scientific basis.

THE generators that George Westinghouse is building to furnish electricity for the 93,000 incandescent lamps at the World's Fair are to be among the largest in the world. One of them will operate 20,000 lamps. "The ordinary generator supplies but 1,200 lamps," Mr. Westinghouse said, "and most of them less. Our largest generator will supply 20,000 lamps, and most of the others will be of 10,000 lamp capacity each."

IRON PIPE

ALL SIZES, FOR GAS, STEAM AND WATER.

— WE MANUFACTURE —

SHEET IRON AND STEEL PIPE,

ALL SIZES,

For Water Supply, Mining, Irrigating Purposes, Stock Ranches, Etc.

Made in Lengths Desired from 16 to 30 feet.

The Cut shows a Section of Three Joints

DOUBLE RIVETED SHEET IRON PIPE.

In the manufacture of this Pipe, we use only a high grade o annealed Charcoal Iron of great tensile strength.
The weight or thickness of metal used, is graded according to service required, and pressure to which the Pipe will he suhjected.

FOR ALL UNDERGROUND PURPOSES, we immerse the Pipe in a bath containing a special mixture of ASPHALTUM, PITOH and PETROLEUM, at a Temperature of 300° Farenheit. It thus receives a thorough coating, both inside and outside, rendering it impervious to the alkalies of the earth, rust, etc., and is practioally indestructible.

CORRUGATED IRON,

Black, Painted and Galvanized, for Roof and Sides of

HAY BARNS, DRY HOUSES, STABLES, ETC.

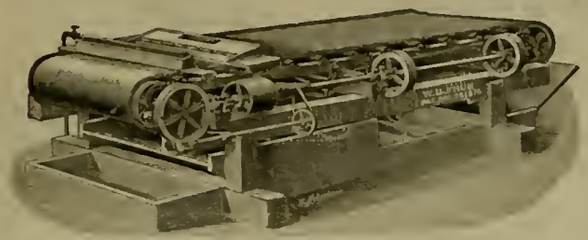
FRUE ORE CONCENTRATOR

OVER 3200 IN ACTUAL USE.



Manufactured under Patents of April 27, 1880; September 18, 1883; July 24, 1888; and March 31, 1891.

GLADSTONE MINING COMPANY, C. J. Clark, M. E. Con'l. Supt. FRENCH GULCH, Cal verss Co , Cal., Dec. 12, 1891.

MESSRS. ADAMS & CARTER, San Francisco, Cal.—DEAR SIRS: During my experience in mining and milling, I have used twenty-four of your four-foot Frue Vanners on different kinds of ore, both gold and silver. I have made competitive tests against them with other widely puffed-up concentrators and have always found the FRUE in first place. When I built this mill (20 stamps), I determined to put in six-foot Frues in order to save space and machinery. I am now running four of your six-foot machines and they have been going for TWELVE MONTHS. They are taking the pulp from 20 stamps, crushing a minimum of fifty tons per day, and do better work than the four-foot tables. They require no more attention than a four-foot table and handle at least twice the quantity of ore. I have run them up to 80 tons per day and could not see that they were crowded. They stop and start as easily as the smaller tables and have the advantage of double capacity with the same bearings and wearing parts, requiring no more oil, and no more wear and tear than the smaller tables. My repair account for the past six months has been too small to mention. In order to give an idea of the work they are doing here I will state that the ore has varied monthly from $5 to $20 per ton and the tailings from nothing to 60 cts. per ton. I will conclude by saying that I cannot endorse the six foot Frue Vanner too highly, and it is the only table that I would have in my mill.

C. J. CLARK, Con'l Supt.

Price of 4-foot wide Plain Belt Frue Vanner..... $550, f. o. b.
" " " Improved Belt Frue Vanner ..... 800, f. o. b.
" 6-foot " Plain Belt Frue Vanner..... 800, f. o. b.

For any information, or for pamphlets, or for circulars or testimonials, call on or address us at our office.

FRUE VANNING MACHINE CO., Adams & Carter, Ag'ts. H. J. Summerhayes, Manager.
No. 132 Market Street. - - San Francisco, Cal.

"TRIUMPH" ORE CONCENTRATOR WITH IMPROVED RIFFLED BELT.

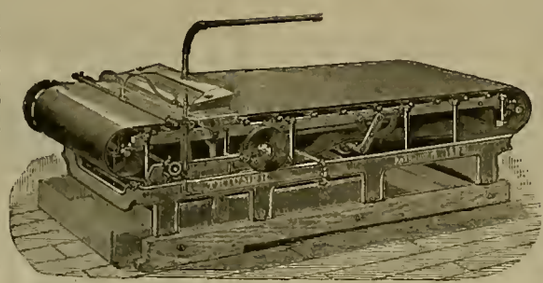
The competitive trials which have been held between the Triumph" Ore Concentrators, the "Frue" Vanners and other forms of concentrating devices, do not warrant the assertion that the "Frue" Vanner is the best ore concentrator in the market. The fact that the "Frues" have improved (corrugated) belts does not militate against the superiority of the "Triumphs;" for, when desired, they (the "Triumphs") can be mounted with a superior belt known as the "Blasdel" Riffled.

—o—

Price "Triumph" Concentrators, with Improved (Patented) Belt - - - $650 f. o. b.
Price "Triumph" Concentrators, with Plain Belt - - - - - - - $550 f. o. b.

—o—

We are prepared to guarantee the superiority of the "Triumph" over the "Frue" or any other form of Concentrator, for coin if used be. Circulars and testimonial letters furnished on application.



JOSHUA HENDY MACHINE WORKS,
39 to 51 Fremont Street, San Francisco, Cal.

(PATENTED.)

Both the "Triumph" Concentrator and "Blasdel" (riffled) Belt are protected by incontestable letters patent, granted by the Government of the United States.

Original Empire Mill and Mining Company,
Principal Office, 401 California St., cor. Sansome, S. F.
Location of Works, Grass Valley, Nevada Co., Cal.

GRASS VALLEY, NEVADA CO., CAL., Nov. 10, 1885.

Joshua Hendy Machine Works, 39 to 51 Fremont St., S. F., Cal.:

GENTLEMEN—I am pleased to state, in reference to the "Triumph" Ore Concentrators, that four (4) of them were placed in the mill of the Original Empire Mill and Mining Company in April, 1884, and a thorough test made of their practical operation; and their efficiency having been demonstrated, four (4) more were subsequently introduced as the complement of the Twenty (20) Stamp Mill, and the eight (8) have been and are now running with entirely satisfactory results.

At the Ten (10) Stamp Mill of the North Star Mining Company, under my supervision, four (4) are also in successful operation, and from my observation of their practical workings, I am convinced that this form of Concentrators is the equal, if not superior to any other style of Vanners or concentrating devices. DAVID McKAY, Jr.,

Signed] Sup't North Star and Original Empire Mining Co.

N. B. When the stamping capacity of the two above named mills was increased, more "Triumph" Concentrators were purchased, and twenty-eight (28) are now in constant successful operation.

NOTICE TO GOLD MINERS!

SILVER-PLATED AMALGAMATED PLATES

For SAVING GOLD!

IN QUARTZ GRAVEL, OR PLACER MINES. MADE OF BEST SOFT LAKE SUPERIOR COPPER

AT REDUCED PRICES.

Our plates are guaranteed, and by actual experience are proved, the best in weight of Silver and durability. Old Mining Plates Replated, Bought, or Gold Separated. THOUSANDS OF ORDERS FILLED.

SAN FRANCISCO NOVELTY, GOLD, SILVER AND NICKEL PLATING WORKS,

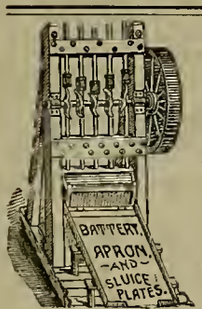
Agent for HOSKINS'

HYDRO-CARBON ASSAY FURNACES.



IMPORTANT TO GOLD MINERS!

SILVER-PLATED AMALGAM PLATES for SAVING GOLD

In Quartz, Gravel and Placer Mining.

PRICES GREATLY REDUCED. ONLY REFINED SILVER AND BEST COPPER USED. OVER 3000 ORDERS FILLED. FIFTEEN MEDALS AWARDED. Old Mining Plates can be Replated. Old Plates Bought, or Gold Separated. These Plates can also be purchased of JOHN TAYLOR & CO., Corner First and Mission Streets, San Francisco.

SAN FRANCISCO GOLD, SILVER AND NICKEL PLATING WORKS,

E. G. DENNISTON, Proprietor. 653 & 655 MISSION ST., SAN FRANCISCO, CAL.

Our Plates have been used for 20 years. They have proved the best. We adhere strictly to contract in weight of Silver and Copper. SEND FOR CIRCULAR.

RECEIVED EVERY MEDAL Awarded on the Pacific Coast for Silver-Plated Amalgam Plates and Best Gold, Silver and Nickel Plating.

PLACER AMALGAMATORS

Combined with Steam Shovel or Dredge.

BUCYRUS SYSTEM.

NEW METHOD OF PLACER MINING.

Saves all the Gold. Uses very little Water. Treats large quantities at Low Cost.

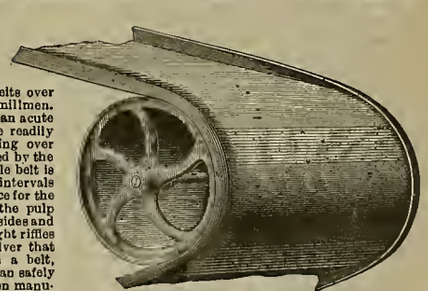
—BUILT SOLELY BY THE —

BUCYRUS STEAM SHOVEL AND DREDGE COMPANY,
BUCYRUS, OHIO, U. S. A.

THE BLASDEL CONCENTRATING BELT COMPANY.

We have now made arrangements to have our new Improved Concentrating Belt manufactured in San Francisco. We keep always on hand Belts suitable for the Triumph and Frue machines, but can make any length or width desired. The advantages of these belts over *any others* will be readily seen by practical millmen.

First, the flanges or edges of our belt stand at an acute angle inclining toward the center, and therefore readily conform to the change of direction while passing over the end rollers; thus the vexation and loss caused by the frequent breaking of the flanges of the old style belt is practically done away with. Again, our belts, at intervals of two to four feet, have a very slight riffled surface for the space of three inches, which tends to equalize the pulp on the belt, and prevents it from banking on the sides and forming channels through the center. These slight riffles also save very fine sulphurets and the quicksilver that would otherwise escape with the tailings from a belt, the surface of which is entirely smooth. We can safely say that it is a better belt than has ever been manufactured for use on this coast. It will last much longer and will handle fully one-third more pulp than any smooth belt, and will save a higher percentage of sulphurets



H. G. BLASDEL, Jr., Manager, 419 California St., San Francisco.

Adamantine Shoes and Dies

—AND—

CHROME CAST STEEL

Cams, Tappets, Bosses, Roll Shells and Crusher Plates.

THESE CASTINGS ARE EXTENSIVELY USED IN ALL THE MINING STATES and Territories of North and South America Guaranteed to prove better and cheaper than any others. Orders solicited subject to above conditions. When ordering send sketch with exact dimensions. Send for Illustrated Circular.

GOOD HEALTH.

Exercise.

Much of the food actually digested and assimilated is not used to the fullest extent, for want of sufficient oxidization to make it yield the greatest amount of vitalizing power to the tissues of the body. Such partially unoxidized products have an irritating effect on the organs and tissues, and predispose them to disease, if they do not directly affect them with it.

Exercise has a stimulating effect on all parts of the body by inducing further oxidation in all the tissues and organs. This increased oxidation is attended by a greater demand upon the part of the system for oxygen, as indicated by the greater number, force and frequency of the respirations.

During exercise the heart beats faster, and forces more blood through the lungs to all parts of the body, bearing in its little blood cells the precious life-giving factor, oxygen. These little cells, one constituent of which, *hæmoglobin*, has the wonderful faculty of quickly loading and unloading itself with oxygen—thus act as direct aids to the process of oxidation in the tissues and organs.

It is the combining of oxygen with unoxidized products in the blood that gives to each individual cell its possibility of sustaining life. Any process which increases the oxygen supplied to all parts of the body tends to strengthen the life in each individual cell, and to give it more power to resist disease.

Exercise, of all factors, does this most effectively; and besides actually producing in each individual cell a greater vitality, it gives a favorable opportunity for the waste products of the tissue to be thrown off rapidly. But thus causing a further oxidizing of certain matter in the blood, it conduces in a double sense to life and health.

Habitual outdoor exercise, with suitable protection from extremes of weather, is the most effectual means of prolonging life to old age.

In this age of rush and hurry, when time is too precious to use for systematic exercise, and when the cultivation of the brain too often debars the remainder of the body from a complete development, it is not to be wondered at that the body succumbs to diseases which overtake it in its prime, because it has not the vitality to resist their inroads.

Our legal authorities would confer countless blessings upon "millions yet unborn" if they would pay more attention to increasing the number of public parks and places conducive to indulgence in outdoor sports.—Youths' Companion.

Tooth Culture.

In a capital address on "tooth culture," delivered at the annual meeting of the Eastern Counties Branch of the British Dental Association, and printed in *Lancet*, Sir James Crichton-Browne referred to a change which has taken place in bread, as one of the causes of the increase of dental caries. So far as England is concerned, this is essentially an age of white bread and fine flour, and it is an age therefore in which we are no longer partaking, to anything like the same amount that our ancestors did, of the bran or husky parts of wheat, and so are deprived to a large degree of a chemical element which they contain—namely, fluorine. The late Dr. George Wilson showed that fluorine is more widely distributed in nature than was before his time supposed, but still, as he pointed out, it is but sparingly present where it does occur and the only channels by which it can apparently find its way into the animal economy are through the siliceous stems of grasses and outer husks of grain, in which it exists in comparative abundance. Analysis has proved that the enamel of the teeth contains more fluorine, in the form of fluoride of calcium, than any other part of the body, and fluorine might, indeed, be regarded as the characteristic chemical constituent of this structure, the hardest of all animal tissue, and containing 95 5 per cent of salts, against 75 per cent in the dentine. As this is so, it is clear that a supply of fluorine, while the development of the teeth is progressing, is essential to the proper formation of the enamel, and that any deficiency in this respect must result in thin and inferior enamel. Sir James Crichton-Browne thinks it well worthy of consideration whether the reintroduction into our diet of a supply of fluorine in some suitable natural form—and what form, he asks, can be more suitable than that in which it exists in the pellicles of our grain stuff.?—might not do something to fortify the teeth of the next generation.

USEFUL INFORMATION.

ALUMINIUM FOR ARMY USES.—A French magazine contains a paper on this metal, giving the results of some fresh experiments which have been made in France in order to test the assertions of certain German chemists. The French claim aluminium as a national metal, and state that it is fitted, by its strength and lightness, to supersede other metals for numerous purposes; but chemists on the other side of the Rhine have thought less highly of it, saying, among other things, that it impregnated the liquids with which it came into contact. The writer in this review is perfectly satisfied with the new experiments. They prove that water, wine, beer, cider, coffee, milk, etc., are less affected by it than are the ordinary metals, such as iron, copper, zinc, etc. Vinegar and sea-water act on it to an ascertained extent, but not sufficiently to interfere with its use. The War Ministry is in the best position to profit by it, not only on account of its capacity to produce electricity, but of its extreme lightness and power of resisting the influence of the atmosphere. It is invaluable in the messing of troops, in the preserving of provisions, for ambulance purposes, for telegraphs, and for the many items, such as scabbards, canteen-badges and buttons, which by being lightened, would permit the soldier to carry more cartridges.

HOUSES OF GLASS.—While transparent glass brick have been employed for some time in walls of buildings to afford light at places where a window would interfere with the architectnral plan, this material has not been used to any extent for general construction purposes. It is now proposed to cast the glass, not necessarily transparent, into large blocks for buildings. As it is practically indestructible, nonabsorbent, and therefore damp-proof, it is expected by this means to furnish coarse glass in suitable shape as cheaply as concrete or stone. A plan has also been put into practice by which broken glass of various colors is mixed up, placed in molds lined with silica, talc, or other resisting material, and fired. The result is a firmly coherent mass, which can be dressed and cut into blocks. These are, of course, irregularly colored and may be employed in place of artificial marble. If decorative effects are desired, designs in relief can be obtained by pressure while the block or slab is still plastic.—Boston Journal of Commerce.

IT is not generally known that the light of the sun and the moon exercise a deleterious effect on edge tools. Knives, drills, scythes and sickles assume a blue color if they are exposed for some length of time to the light and heat of the sun; the sharp edge disappears and the tool is rendered absolutely useless until it is retempered. Purchasers should therefore be on their guard against buying tools from retail dealers and peddlers, which for show purposes have probably been exposed for days together to the glare of the sun. The unserviceableness of tools acquired under these conditions is generally wrongly attributed to had material or to interior workmanship. A similar prejudicial effect has been exercised by moonlight. An ordinary crosscut saw is asserted to have been put out of shape in a single night by exposure to the moon.

A GERMAN firm is bringing out a new type of electric mining lamp which differs in arrangement from the customary form, and which outwardly looks like the ordinary oil safety lamp. The accumulator is carried in a box having greater depth than length or width, and the glow lamp projects upward from the top of this, being surrounded by a glass cylinder surmounted by an iron plate, to which is attached the hook whereby the lamp is carried or suspended. The lamp weighs about 4.2 pound, and gives a light of seven to eight candle power for from ten to twelve hours.

A KIND of seaweed which is plentiful on the coast of China furnishes an admirable glue and varnish. When dried it is waterproof and it is employed to fill up the interstices in bamboo network, of which windows are frequently constructed in that country. It is also utilized to strengthen and varnish paper lanterns.

THE system of road-making known as macadamizing was invented by Mr. John Macadam and published by him in an essay in 1819, having practiced it in Ayrshire. He prescribed stones to be broken into six ounces weight, and the use of clean flints and granite clippings.

Educational.

JOHN T. EVANS,
Assay Office and Chemical Laboratory,
ROOMS 46 AND 47 MONTGOMERY BLOCK, 628 Montgomery Street, San Francisco. For nearly 15 years with Thomas Price, as Chief of the Ore-Assay and Analytical Department. Lessons given in Assaying and Chemistry.

School of Practical, Civil, Mechanical, Electrical and Mining Engineering,
Surveying, Architecture, Drawing and Assaying,
723 MARKET ST., SAN FRANCISCO, CAL.
Open all year.
A. VAN DER NAILLEN, President.
Assaying of Ores, $25; Bullion and Chlorination Assay, $25; Blowpipe Assay, $10. Full Course of Assaying, $50.
ESTABLISHED 1864. Send for Circular.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior. In proximity to the mines mentioned

CALIFORNIA.

Amador.

SUTTER CREEK.—Amador *Ledger*, Aug. 6: Cheering news is at hand of the South Eureka, being one of the mines of Amador county, and not a mere prospect. On striking the wall in the east crosscut a small vein about four inches thick was found, with the absence of any sign of gold. This was somewhat discouraging, but they kept it to themselves and made up their minds to drift north on the vein, which soon began to increase in size, till it has developed to about five feet in thickness and, the best of all, prospects $10 or $12 per ton. This makes the stockholders jubilant and one has already remarked that he would refuse an offer of $20,000. The local stockholders are J. Dennis, J. F. Parks, J. McIntire and Dr. J. L. Mayou. They intend to continue drifting, and as soon as that level is sufficiently explored, in all probability sinking will be in order again. [We sincerely hope our correspondent's figures as to the quality of the ore may prove correct. They do not, however, tally with the statement, based on actual assays, given us from headquarters. While the quartz at present met with may be nonpaying, there is no reason to feel discouraged. The main fact remains—a strong ore body has been met with and it is out of joint with the general character of veins on the mother lode, if it does not lead to pay rock. —Ed.] Taking water out of the Hector is about through for the present. They are below the 700-foot level now, where water will be kept, while levels are being opened up between the 200 and 600 foot levels. At the earliest opportunity the mill will be started. A new track is being put in the shaft, which is necessary for steady work. At the Wildman everything is running full force, and there is nothing new to report. Exploring at the Belmont is being pushed with all possible speed, and sinking will likely be brought to a halt soon. Attention will be directed to the opening up and taking out of ore. After a rest of two weeks for repairs, the sulphurets works have resumed operations again.

BAY STATE.—Amador *Ledger*, Aug. 6: The vein discovered on this claim had widened out in the early part of the week to five feet on one side and three or four feet on the other, and still widening. The ore is of low grade, estimated to mill $5 or $6 per ton. With a strong ledge, this can be made to pay handsomely. The stockholders are naturally greatly enthused over the prospects, and the population of Plymouth generally shares in the expectations of better times as the outcome of the successful opening up of this mine. Quite a number of Plymouth folks—stockholders and others—visited the mine last Sunday.

SOUTH EUREKA.—The drifting operations at this mine encountered a body of ore last Friday, and by Sunday the ledge was disclosed to the width of several feet. The quartz is of a dark character, mixed with considerable slate. Some pieces were taken out showing free gold. All the ore seemed to be plentifully charged with sulphurets of a dark color, and somewhat different from any found elsewhere on the main belt. To all appearances, it was of good grade, and indeed expert miners who saw the ore never doubted that it would surrender the precious metal in paying quantities. It is very disappointing to have to report otherwise. Samples of the ore have been assayed at the Kennedy, and the highest yield obtained was $2.50 per ton down to as low as $1.25. Mr. Parks was as fully satisfied of the pay nature of the quartz as any one on first sight, and was very much surprised at the poor showing. The ore shoot seems to extend upward and downward. Barren places are met with even in the best gold-bearing ledges of the mother lode, and it is probable that one of these nonproductive spots has been struck in the South Eureka. The result of further exploration will be awaited with much interest.

AMADOR GOLD MINE.—The affairs of this property seem to be as far from settlement as ever. The report that the English and American stockholders had agreed upon a basis of settlement of their differences appears to have been premature. At any rate, it is now said that no agreement has been reached, and the prospect is that the courts will have to arbitrate the differences between the two factions. This means an indefinite prolongation of the present idleness of the property.

MISCELLANEOUS.—The shaft track and timbers are being taken out of the Plymouth Consmine, which looks like the complete abandonment of this celebrated property. W. T. Jones reports that the Bay State gives every promise of a solid mine. The ore shoot has been followed 75 feet.

Butte.

IN GRANITE BASIN.—Oroville *Mercury*, Aug. 3: Jo. Peppin of Granite Basin came down last night with 11 ounces of gold taken from a quartz mine. About five years ago he bought the property for taxes and it was not redeemed. He drove away at the mine until he developed a rich ledge and the ex-owners—San Franciscans—instituted suit to recover the property. The contest has been going on four years, until recently, when a compromise was effected whereby they agreed to work the mine in partnership. They intend now to put up a good mill and work the mine thoroughly. Mr. Peppin says the rock he has crushed yielded an average of $15 to the ton, free gold.

A RICH LEDGE.—Jas. Cory of Clear Creek went to the Bangor mines a few days ago. Being of an investigating turn of mind, he prospected for a day or two and was rewarded by the discovery of a quartz ledge that prospects rich. The sample of rock sent to the *Mercury* contains free gold. The ledge is about four feet wide but its extent is yet a matter of conjecture.

Fresno.

WATERLOO.—Madera *Mercury*, Aug. 6: The Waterloo mine will soon change hands. It is not known who are the intending purchasers nor what price they will pay, but it is said that a big figure will be given for it. Swanson's mine near Grub Gulch has been bonded by a San Francisco company for a year. The company has an option of buying at the end of that time for $6000. A five-stamp mill is on the way from San Francisco and will be put in as soon as it arrives. Mr. Swanson will get one-half the proceeds, besides a salary for running the mill. The mine is very rich, a large amount of gold being taken out the last clean-up. There are two Huntington mills on the way to Grub Gulch. They are to be put in mines there.

Humboldt.

WILLOW CREEK MINES.—Blue Lake *Advocate*, Aug. 6: It has not been such a very great while since discovery of gold in quantities on Willow creek and the consequent epidemic of mining locations broke out there. The miners have not found life along the creek an ideal existence. The ounce of bitter has been found in each lump of sweet. Insufficient means to develop their claims has been the great drawback, and the miners, not taking life too seriously, have plodded on, doing, with their primitive methods of separating the gold, the best they could. They have not accomplished much. All this is preliminary to saying that an English syndicate has turned its eyes in that direction and there is a possibility, if not a probability, that it may be induced to take hold of the mines in an energetic way. The company possesses ample means for their development, and if they should pass under its control a new era would dawn upon that mining region. J. J. Moston of Eureka, who has been below to confer with the representatives of the syndicate accompanied by J. L. Callison, a mining man from Nevada, came up from the county-seat Tuesday and departed for Willow creek the same day, the understanding being that Mr. J. Garnett, one of the English syndicate, should arrive in Eureka by Thursday's steamer and immediately join them. Whether anything shall come of the contemplated deal is the merest conjecture. Capital is cautious, and mining investments have not invariably paid dividends in California. Something may come of this visit of Mr. Garnett to the mines, and then again it may result in nothing whatever.

Napa.

A FINE PROSPECT.—*Calistogian*, Aug. 6: Four miles, air line, from Calistoga, on C. H. Holmes' Yellow Jacket Ranch, a few miners have been at work several months endeavoring to find cinnabar in paying quantities. It has been the expressed desire of the principals that nothing be said publicly about the work unless something was found worthy of mention. Now, however, developments have been made that warrant us in writing of them. A shaft was sunk to a depth of 113 feet, then a drift from it was started. A small vein of cinnabar was encountered, and upon this the miners drifted, the work progressing somewhat slowly, as in cases where steam power is not used in hoisting earth. For about 150 feet the vein was followed until a few days ago, when a body of cinnaber was cut, the extent of which is unknown. Last Monday the drift had been advanced into the body a distance of 15 feet, nothing being cut except ore, and the whole face is still in ore. The outlook is good for a mine there, and Calistogians will look forward with much interest to the result of further work, as a good quicksilver mine there would be of value to the town. On the property there is a furnace, which, though old, has been but little used, and can be put in complete order in less than a month. Thus there will be but little delay in producing quicksilver in case developments warrant the making of necessary repairs, and there is every reason to believe, at this time of writing, that they will.

Shasta.

BONDED. — Shasta *Democrat*, Aug. 3: The Quartz Hill, owned by Thomas Harrison, Bob Lyons and Steve Meek, and the first extension south, owned by W. T. Hiatt, all of Buckeye, has been bonded to a gentleman representing the company operating on the Sky-blue mine. The people who have bonded the property have commenced development by sinking a shaft on the ground, and will put it down to water level, when a crosscut will be run north and south from the bottom of the shaft. The bond runs for so short a time, that, taking into consideration the extensive work started, it is believed it is equivalent to a sale. The Bell brothers are inclined to the belief that their lead prospect near Buzzard Roost will develop into one of the best pieces of mining property in the county. They will expend considerable money developing the property this year, and next week Mr. Scranton, superintendent of the Sunny Hill mine, will take charge of the lead prospect. Geo. McDaniels is up in the vicinity of Copper City prospecting for the Bell brothers. Mr. Hart, Sr., has 25 miners at work in the Ballychoop mine.

NEVADA.

Washoe District.

CON. CAL. & VA.— 1500 level: From the south drift at point of connection with the old stopes, we continue to extract some ore and fillings of average milling value. From the upraise which was carried up from the end of the crosscut run west 36 feet in from the main south drift, 155 feet south from the shaft station, we have continued to work upward and to extract ore of fair quality. 1600 level—We have continued prospecting upward from the old sill floor to the old stopes, from which some ore of fair quality is being extracted, and have been making some repairs to the main south lateral drift. 1750 level—In east crosscuts No. 1, 3 and 5 from the main south drift, in working upward from the sill floor, have continued to extract some milling ore. From the end of the drift run south, 88 feet from the end of the crosscut run west from the end of the southwest drift, the upraise has been carried up 21 feet; total height, 44 feet; in a porphyry and quartz formation which carries a low assay value. Are repairing and retimbering the main southwest drift. 1800 level—Along the south end of the drift running south from the crosscut run east from the winze No. 1 sunk from the 1750 level, we have continued to extract some ore from the sill floor upward of milling value. From the bottom of winze No. 2, down 45 feet, a west crosscut, No. 2, has been advanced 24 feet in a quartz formation of very low assay value. There has been extracted from all parts of the mine during the week 978 920-2000 tons of ore, which was shipped to the Morgan mill, the average assay value of which, per car samples, was $23.08 per ton. The average assay value of all the ore worked at that mill during the week, 980 tons, was $19.42 per ton per battery samples. Bullion shipped to Carson Mint, assay value, $14,700.68. Bullion on hand in our assay office, assay value about $15,323.90.

OPHIR.—1165 level—From the south drift 101 feet below the sill floor of the 1465 level, at a point 84 feet in from its mouth, the west crosscut has been advanced 24 feet; total length, 84 feet, continuing in a quartz formation showing clay separations and carrying a very low assay value.

MEXICAN.—On the 1465 level the drift running north from the crosscut run east from the bottom of the winze sunk 101 feet below the sill floor of this level near the south boundary of the mine, at a point 40 feet east from the winze, has been advanced 20 feet; total length, 209 feet; in porphyry with some clay and fine lines of quartz carrying low assay value.

UNION CON.—900 level—The Joint Union Con. and Sierra Nevada west drift has been extended during the week 25 feet; total length west from the joint shaft, 2277 feet. The face is in a mixture of quartz and porphyry of no value.

UTAH—340 level—From the end of the north drift (at a point 432 feet in) from the west crosscut from the shaft station, west crosscut No. 2 has been extended 45 feet; total length, 137 feet, continuing in porphyry showing some clay seperations.

SIERRA NEVADA.—The east crosscut No. 2, 200 feet south of No. 1, 1000 feet in Kenosha tunnel has been advanced 35 feet; total length, 70 feet; face in porphyry and streaks of quartz. The joint Sierra Nevada and Union west drift, 900 level, was advanced 25 feet; total distence west of shaft 2277 feet, face in mixture of quartz and porphyry of no value.

BEST & BELCHER. — 900 level—During the past week west crosscut No. 1 has been advanced 10 feet and discontinued; formation passed through was hard west country rock; total length, 416 feet

GOULD & CURRY. — 200 level — Northwest drift, started 435 feet west of shaft, has been extended 14 feet through hard porphyry; total length, 453 feet. On the Sutro tunnel level, we have finished repairing the joint north drift with the Savage company, and started to work in the face.

HALE & NORCROSS.—We have finished retimbering the main shaft between the 400 and 500 levels, and have started to retimber the shaft at the 1100 level. The south drift was advanced 30 feet; total length, 60 feet; face in porphyry. These drifts are continuing outside and east of the ledge.

CHOLLAR.—Are making repairs on the 450 and 650 levels. The east crosscut near the north line, 900 level, is in 115 feet; face in soft porphyry.

POTOSI.—Extracted and sent to the mill in the past week 484 1000-2000 tons of ore from the 930, 1100, 1150, 1200 and 1300 levels. Milled during the week 484 tons. On hand at mill, 108 500-2000 tons; average battery assay, $25.30; average car sample assays, $30.30. Shipped to Carson Mint 85½ pounds of crude bullion.

BULLION.—Have excavated and timbered for a chute at the 1300 station in Potosi winze. Are cleaning and repairing south drift on 1300 level, preparetory to raising in the body of quartz found in east crosscut, 320 feet south of north line. Have resumed sinking the joint Potosi winze. The northwest drift from the 1300 station of Ward shaft has a total length of 692 feet; face in hard porphyry.

ALPHA.—The joint Exchequer and Alpha south drift from north line of Exchequer, 1800 level of Ward shaft, has a total length of 344 feet; face shows quartz of low assay value.

WARD COMBINATION SHAFT.—The joint Alpha and Exchequer south drift from the nort line of Exchequer, 1800 level of Ward shaft, has a total length of 344 feet; face shows some quartz of low assay value. The joint Bullion and Potosi northwest drift, from the 1800 level, has a total length of 692 feet; face in hard porphyry.

CON. NEW YORK.—The winze in No. 4 west crosscut, 650 level, is down on the slope 56 feet, bottom shows some fair-grade ore.

SILVER HILL.—No work has been done in the mine the past week owing to the closing down of the Justice shaft. Resumed work yesterday.

ANNEX.—During the week east crosscut No. 1 north on the 420 level was advanced 18 feet; formation quartz and porphyry.

OCCIDENTAL.—From the stopes on 350, 400 and 450 levels have extracted and milled 175 tons of ore of the average assay value of 21.40 per ton as per battery samples. West crosscut No. 4, on the 750 level, has been extended eight feet; face in hard porphyry. East crosscut from Zadig drift, Sutro tunnel level, has been advanced 21 feet in favorable-looking vein matter.

Ploche District.

FINISHED UP.—Ploche *Record*, July 28: The corps of mining engineers and experts, which for six weeks past has been examining the various properties of the Ploche Con. M & R. Co. here and vicinity, has completed its labors and withdrawn. The last to finish up was Prof. E. E. Olcott, who to-day left for Ferguson district, where he will examine the mines before starting for the north. Prof. Olcott's report on the properties here is full and exhaustive in every detail, and is believed to be a favorable one. It is said the examinations ere made in the interest of the Consolidated Kansas City Smelting & Refining Company, with a view to consolidation or outright purchase. This company is already a vast and successful concern, and should they obtain a footing in this section, a long era of profitable business is looked for. As nearly as we can learn, the matter will be definitely determined within the next 30 days. Matters at the smelter are progressing very favorably. The output of bullion is unusually large, which speaks volumes for the management. The Yuba is still looking exceedingly well, large and new bodies of ore showing, as a result of the development of the last few months. The Poorman claim, east of town, is steadily improving. The working force has been slightly increased, and the production for the month will be double that for June. The smelter is still turning out lots of bullion and running very smoothly. Sorting has been resumed on the old Bristol smelter dump, and seven men are engaged in the work. It is calculated that several thousand tons of material which will pay handsomely can be yet gotten out.

Tuscarora District.

NAVAJO.—*Times-Review*, Aug. 5: The stopes above the 350-level are without material change. Everything running as usual.

DEL MONTE.—Hauled to and worked at the concentrating plant 168½ tons, average assay value $38 per ton.

NORTH BELLE ISLE.—No. 2 upraise, south 500-foot level, extended 20 feet, total length 70 feet. The stopes are yielding some very good ore. No change elsewhere in the mine since last report.

NORTH COMMONWEALTH.—Second level: Cleaning up the drifts and repairing where needed; also at No. 3 shaft. Hauled and worked at concentrator 168½ tons, battery assay $38 per ton.

COMMONWEALTH.—East drift from chute 5 in east crosscut connected with Queen opening, exposing low-grade ore. Have started joint west drift on the line, also dritting east on the line in the west vein, showing some good ore. Have started to open stopes on the west vein just north of line; ore is high-grade but small.

BELLE ISLE.—Line crosscut, 250-foot level, extended 10 feet. Upraise from south drift, same level, extended 14 feet. A winze has been started on the ore at this point; the vein is getting wider, ore very rich. Upraise from No. 2 stopes extended 12 feet. East intermediate crosscut above the 350-foot level, extended 7 feet, cutting the vein again in good ore.

NEVADA QUEEN.—North drift from No. 5 advanced 19 feet in vein metter. North drift from No. 6 advanced 20 feet, one foot of good ore in the face of drift. North drift from No. 7 extended 18 feet, showing second-cless ore assaying $40 per ton. Line drift, west vein, in 90 feet, exposing four inches of $80 ore. Line drift going west in the east vein has been started, three feet of $25 ore in the face. South from No. 3 crosscut there is one foot of $200 ore. Extracted 13 cars first-class ore, and worked at the concentrator 252.9 tons, average assay $30.15 per ton. Received from Union mill $5051.22.

ARIZONA.

SILVER ANN COPPER.—Cor. Los Angeles *Times*, Aug. 6: There has been no silver development of great importance in the Territory since the discovery of the Tombstone mines. The much vaunted "bonanza" mines at Quijotoa were a dead failure from the start. They have been worked, in a desultory manner, on the San Francisco stock market for several years, the stock being now peddled at a nickel a share—which is five cents more than it is worth—and a plaster of the same amount in the shape of an assessment as often as the patient's—the patient stockholder's—pulse indicates that he can stand it. The old Silver King, that wonderful mine which has furnished such remarkable specimens of native silver, has been gutted, as far as the visible deposit is concerned, though there are those who believe that by judicious prospecting ore might yet be found. The mill has been moved away from Pinal. The Reymert mines in Pinal county, belonging to a resident of your city, which turned out a considerable amount of bullion, have been shut down for some time, owing to difference of opinion among the owners. There are, however, many smaller silver mines being worked on an unpretentious scale throughout the Territory, the aggregate output of which is quite important. Many of these have a good chance to develop at any time into a bonanza. The Harqua Hala mines, in northern Yuma county, which were discovered about three years ago, have proved to be veritable bonanzas, turning out a large amount of bullion. The Mammoth gold mine, on the San Pedro near Tucson, owned by Englishmen, is also making a good record for itself, turning out bullion steadily from a large mill. It is, however, in copper that Arizona is at present most distinguishing itself, as far as mining is concerned. The copper deposits of Arizona are wonderful as to richness of the ore. Few copper deposits could be worked under such unfavorable circumstances as these. There is the Old Dominion mine at Globe, which is nearly 100 miles from the railroad. Coke, to be used in smelting, has to be hauled this distance by team. Yet the Globe mines have a large and increasing output and pay "big." The United Verde copper

mine, in Yavapai county, has a tramway 20 miles long, to connect with the Prescott and Arizona Central railway, and supports a large camp. Another flourishing copper camp is that at Bisbee, near Tombstooe. The town is booming just now. They have a railroad from Fairbanks, electric lights, and are talking about a street-car line. The copper mines at Clifton, in Graham county, continue to turn out a stream of metal. The value of the copper produced in Arizona in 1892 promises to be close up to $5,000,000. Large onyx deposits have been discovered recently in Maricops, Cochise and Yavapai counties. The latest is a discovery of black onyx in the latter county.

IDAHO.

FLORIDA MOUNTAIN.—Silver City *Avalanche*, July 30: The Black Jack is owned and operated by the Idaho & Pittsburg Mining and Milling Company. The majority of stockholders are residents of Pittsburg, Pa., and their interests are carefully looked after here by Frederic Irwin, the superintendent. In 1890 and 1891, a crosscut was run some 1200 feet to cut the Black Jack ledge and develop the property. An Ingersoll-Sargeant air-drill plant was erected at the mouth of the tunnel. The Black Jack ledge was cut 945 feet in, but was comparatively barren. The crosscut was exteoded on toward the Empire State vein several hundred feet, but work on the same is now discontinued. A drift was started south on the Black Jack vein, and it was on this, 312 feet from the crosscut aod 1257 feet from the mouth of the tunnel, that the rich ore mentioned some three weeks ago was struck. They have run the drift about 70 feet farther, and the ore continues even richer and in a larger body than when first opened. For 70 feet now they have had from 6 to 18 inches of ore which a conservative estimate would value at $200 per ton. The ore which is now being sacked for shipment has an average assay value of over $600 per ton. No stoping has been done, all the ore so far extracted coming from the drift, and the pay streak is as strong in the present face as at any point oo the shoot. The ledge is between solid granite walls, and the present workings are about 800 (estimated) feet below the surface. The ten-stamp mill erected hy the company last year in anticipation of opening a body of ore on cutting the Black Jack ledge, whicb has been lying idle almost since its completion, will now be remodeled to adapt it to the changed character of the ore, which is now slightly base. A nine-ton lot of ore was milled last week for a test, and it is probable that concentrators will be added to the plant. We could not visit the north side of Florida mountsin without calling at the Phillips & Sullivan mine, owned by Isaac Phillips and J. F. Sullivan. This is one of the camp's steady bullion producers and has ore enough in sight to keen all the mills in the county at work. The Belfast crosscut, 636 feet in length, run by cootract during the past winter, has opened a 13-foot ledge of rich ore at a good depth. Connections were made witb the winze last week, and now excellent ventilation is secured. This tunnel is connected with the boarding-house level by 110-foot winze. The Hick's winze extends from the latter level to the surface, a distance of 120 feet. The property is well opened and prospected, and the ore reserves are immense. A new ore-house 15x30 feet is now being built near the month of the Belfast tunnel. As soon as this is completed, a force of miners will be started in the stopes.

MONTANA.

THE WASTE DUMPS OF BUTTE.—*Inter-Mountain*, Aug. 6: The vast waste dumps of this district, for sucb a comparatively new mining country, are sources of wonderment to visitors from abroad. It is an easy matter to make a visitor believe that in the underground workings of the Lexington mine there are some 14 miles of tunnels and drifts, after he has viewed the enormous quantity of waste on the dump. It represents an extraordinary expenditure of wealth and muscle, and in most mines the dumps do not represent the many tons of waste which are used in filling up the interior workings of the mines. Hundreds of tons are daily used in the Anaconda mine in filling in places to make the workings more secure. In conversation a few days ago with an old miner who has had a varied experience of over half a century in different mining districts, he incidentally mentioned a peculiarity of tbese dumps. In the taking out of waste a large percentage of ore necessarily accompanies it, and he said that if after the lapse of 50 or 60 years a drift was run into the dump, the ore would be found to have stratified and formed itself into a ledge similar in every way to a natural ledge enconntered in the earth. A piece of iron left in the dump will after a time attract to itself particles of mineral, and if removed, after being buried for ten years, will be found to be several times its natnral size.

THE ROCHESTER DISTRICT.—Reports of mining operations in the vicinity of Rochester are very enconraging. Edward Mueller is working the Buffalo and employs two sbifts of men. It is said that the average net yield of this property during the past few weeks has been $700 per day. Regnlar shipments of ore, which averages 80 ounces in silver to the ton, are made to Butte and Omaha. The Nancy mine is operated by Porter and Deacon of this city. Tbe ledge on this property is quite narrow, but the assays made run very higb in silver and gold. The lowest returns received were 70 ounces and the highest 1360 to the ton. A shaft 70 feet in depth is on this property. Leavitt and Ward are leasing on the Watseka and are only engaged in surface work. A whim hoist is being operated on the property and the retnrns are said to be very satisfactory to the leasers. Bartine and company are working some properties abont two miles from the Watseka and are producing some very fine silver and lead ores. Ryan and Malloy are working an adjoining claim and bave erected a whim and hoist on tbe property, from which a fair quality of ore is being obtained. This last does not by sny means include all the paying mines of this district. The hills are dotted with shaft houses and windlasses, and it is estimated that some 30 or 40 prospectors are in that neigbborbood this summer, all iotent npon the uncovering of the rich ore bodies whicb are believed to exist in that section of country. W. A. Clark of Butte has a representative in that country and it is said that some very promising prospects have been discovered. A Kansas City syodicate has also made recent explorations in that vicinity, and if anything of an encouraging nature is discovered, the gentlemen who compose the syndicate will bond several of the most promising mines.

SOUTH DAKOTA.

THE FAMOUS J. R. MINE.—Deadwood *Pioneer*, Jacob Lampert, one of the principal owners of the J. R. mine, which is jnst now attracting considerable attention, was in the city yesterday. Tbe mine is located on Spring creek, about three miles from Hill City, and is free-milling ore. A sbaft has been sunk to a depth of 70 feet, disclosing a vein of quartz varying in width from 18 incbes to 8 feet, aod carrying an averags of $50 a ton in gold. The ore is being milled at the Summit mill, now owned by the J. R. Company, and the rock is hauled a distance of three-quarters of a mile. The last run of ten days netted over $3000 witb five stamps. The J. R. was located originally for tin, but prospecting disclosed the fact that the ore carried gold in paying quantities. From the present outlook, it will prove one of the richest mines in the Black Hills.

MARKET REPORTS.

Local Markets.

SAN FRANCISCO, Aug. 11, 1892.

General trade the past week has been fairly active with a large increase in the volume of goods sent out. From all we can learn, the buying has been largely of an assortment character, although more stock buying from distant points was noted. Retail merchants are pursuing a conservative course, and do not show any disposition to buy beyond near-by wants. This is a healthy sign, and if persisted in, it will he greatly to their advantage in the end. The general tone of the market is firm, with a tendency to bigher values in some lines. The cut in freights by sail between New York and this port, while accepted as of the greatest possible advantage to the wholesale trade in this city, is, for the present, a disturbing factor in this—that no one can tell how low freights will be sent by sail or steam via Panama or by the overland transportation companies before the bottom is touched or a compromise is effected. While the present situation unsettles the market for leading articles brought from the East, yet signs are not wanting going to show that importers are taking advantage of the favorable conditions to import heavier than ever before. The lower freight rates will largely offset the disadvantages under which they work through the high local freights. The railroad company, the past week, reduced freights to points in Oregon and Washington. This ought to place our merchants on a more favorable footing in those two States. Farm and orchard products are moving quite freely, particularly that of fruit. The high prices realized here and at the East are putting the industry on a far more stable footing than was done two years ago. The high prices in 1890 were followed by a big speculative boom in lands, etc.; but this year the feeling is more conservative and therefore much better for all interests concerned, Foundrymen and ironworkers in general report, as a rule, more orders executed and in hand than has been the case for several years past. Structural material is being called for quite largely. This is due to more building and other improvements under way than ever before. The local money market continues to rule easy, although there is a steady increase in the call for funds from the country for crop purposes. It is quite generally claimed that all requirements will be met without any undue closeness or friction in the market. The very beavy shipments of fruit and other products eastward give a liberal supply of exchange on tbe East, while renewed exporting of wbeat gives a liberal supply of exchanges on Europe. It is claimed that from now on there will be a steady gain in the amount of grain sbipped from this coast. Eastern mail advices continue to report an easy money market. The placing, by the Treasury, of the Chicago national banks on the same footing with tbe New York national banks relieves, to a great extent, the latter banks of the large drain of money, during crop seasons, of funds for the central States. This relief so far equalizes the money market that in moving the crops the serious frictions heretofore felt will be done away with. The labor troubles at the East continue a disturbing element there.

SILVER—The market has declined rapidly; today London cables 38¼d and New York telegraphs 83 cts. These low prices take the general public by surprise, but bankers and capitalists having connections with England were not ouly prepared for the drop, but look for still lower prices before the bottom is touched. The way in which the market acted previous to the last serious decline not only indicated lower prices, but also that it was under strong manipulation. The prevailing opinion today is that the commercial countries will be forced to take a most decided stand in favor of protecting silver, and at the coming International Monetary Conference action will be taken in that direction. England, which has stood so stoutly for gold, will doubtless change front, for the drop in silver has unsettled exchanges, and demoralized trade by destroying the purchasing power of silver. The greater part of England's trade is with countries and colonies that use silver, and the drop in the market value of the metal has paralyzed the trade with them, so that, in self-protection, tbat nation must aid in reinstating silver to its former standing as a circulating medium of trade and commerce. Germany's course will be influenced hy England's, and as for France, Italy and other European countries, they have always stood for bimetallism.

MEXICAN DOLLARS—The drop in silver has demoralized the market, and it is difficult to get correct quotations. The market is nominal at around 67¼ cts.

QUICKSILVER—Receipts the past week aggregate 125 flasks from Australia and 425 flasks domestic. The market at the East continues weak. In our market, concessions are made to buyers, but no lower quotations reporteó.

LIME—Imports the past week aggregate 2356 bbls. The market is steady at $r.25@1.50 per bbl. There is a fairly active demand.

BORAX—Receipts the past week aggregate 220 ctls., and exports by sea 1016 ctls. to New York. The Candelaria *Belt* says: "Negotiations are now in progress for the consolidation of the various horax companies in western Nevada, together witb the works at Daggett, Cal., and the properties in the State of Washington. The interests to be brought together represent a capital of $2,000,000, and it is probable that as soon as the combine is effected the price of borax will be put at a figure that will justify the resumption of operations at the marshes that are now idle in this country, whicb will benefit this section mightily."

PIG IRON—The low freights offered by sail from New York has tended to weaken our market, and although quotations are unchanged, yet they are considered more or less nominal. The consumption on this coast is larger than it has been for years. New York mail advices report still lower prices, as do cables from England.

TIN—In our market the demand for both pig and plate is lessening. New York and English advices indicate that another bull campaign is being inaugurated, but whether it will he as successful as the last remains to be seen. Imports of pig the past week aggregate 2519 from Australia.

COPPER—The market has held fairly steady the past week. European advices report an increase in the stock with charters in Chili for the shipment of 2200 tons. New York advices report a fairly steady and conservative market.

PIG LEAD—The market is essentially unchanged either on this coast or at the East.

COAL—Imports the past week aggregate as follows: Tacoma, 4700 tons; Departure Bay, 4738; Newcastle, N. S. W., 6160; Seattle, 3100; Coos Bay, 450. Total, 18,748 tons. The market for spot and for near-by cargoes is reported strong with some asking an advance. For shipments, sellers are firm at full asking prices, owing to ships asking more money to come to this port. Coast coals are irregular. The consumption is increasing slowly.

Eastern Metal Markets.

NEW YORK, Aug. 10.—The following are the closing prices the past week:

	Silver in London.	Silver in New York.	Copper.	Lead.	Tin.
Thursday	39	85¼	11 50	3 95	20 65
Friday	38 15-16	85	11 50	4 15	21 65
Saturday	38⅜	84⅜	11 50	4 05	20 65
Monday	38⅜	84¼	11 50	4 05	21 40
Tuesday	38⅜	84¼	11 50	4 05	21 45
Wednesday	38¼	84	11 50	4 05	20 45

Pig Iron continues to rule in buyers' favor, owing to strong selling competition from the south. Copper is fairly firm. Pig Lead is slow, but there is no selling pressure. Pig Tin is again under manipulation. Borax is steady.

THE Presidio and Ferries cable road extension from the junction of Union and Steiner streets, out Union to Baker, and thence on Greenwich to the Presidio, has been completed and is now in operation. The steam dummy is only used from the intersection of Greenwich and Baker streets to Harbor View.

Mining Share Market.

SAN FRANCISCO, Aug. 11, 1892.

Mining shares the past week have been dealt in only to a limited extent by outside investors. The latter's purchases were more or less confined to Union and Sierra Nevada shares, owing to the glowing reports put out regarding the prospects in the Union-Sierra Nevada west drift. There can be no doubt of their striking ore in this drift, but it is equally as certain that it will be more or less broken and that it cannot be utilized to advantage until connections are made either above or below. It is not at all unlikely that when the time comes (after the rings have peddled out a sufficient quantity of the shares), a winze will be sunk; but whether on the ore or not remains to be seen. On the lower levels the ore is more compact and the lode wider and richer than where they will strike it on the 900-foot level. Of course, to sink a winze and do development work will take money, which means assessments. How long it will take to do the work will depend altogether on the length of time the public will pay assessments before selling. How the shares will be manipulated in the meantime the writer does not know, but it is quite safe to say that insiders will first induce buying by better prices and bull reports, after which the old game will be played to the best advantage for insiders. The secret work under way in Mexican, Ophir and two or more of the other mines is very important, and the members of the Mining Stock Association do not "catch on" the same as they did when the share market was considerably higher. The public is getting tired of too much fraud talk. What is now wanted by the large majority is more reliable and explicit news from the mines than is given in the skeleton reports of the superintendents of the mines.

Bob Morrow, who it is claimed is D. O. Mills' confidential broker returned on last Monday, but so far he has not broken the market, according to reports on the street, as was desired by the man he operates for, but it is claimed that he will yet do the work, and is only waiting a favorable opportunity to execute, or have executed by bis brokers, the bear orders. The points are out for lower prices, then get in on the long side. Perhaps this is part of the program so as to more successfully break the market. Sbrewd but conservative operators are watching with considerable interest the movements of the market at New York for railroad and industrial stocks. They claim that with investors attracting to these securities interest in mining shares soon follow, when a real genuine bull campaign is the more successfully engineered. Mail advices under date at New York of August 5, report the market for railroad and industrial stocks, more particularly for the latter, gaining in strength. On this point the financial editor of the New York *Mail and Express* says: "The market is unquestionably as strong as it is quiet and the Stock Exchange commission houses are not at all active. They have comparatively little to do, but their orders are largely on the buying side. They are selling few stocks, but have a long list of orders booked to buy at any concession. There is only this one story. Commission houses are doing very little business because their orders to sell are so small and the market so strong that that buying orders which had been advanced day after day could not he reached. One book showed a list of buying orders twice as long as that for selling, and the buying orders were at low prices still, although they had been advanced. It is quite patent that the investment demand in the market is strong, although it is not especially active." The above indicates that we are nearing an era of more active speculation.

In a letter to secretary Havens, superintendent Lyman of the Consolidated California and Virginia mine says: "We are obliged to report to you that the three bars, Nos. 4197 to 4199, total value $111,337.01 (our shipment of July 26th), do not belong to this company, hut to the Comstock Mill & Mining Company, it having come to our assay office misdirected. We did not discover our mistake until some time afterward. This bullion, of course, is eliminated from our account." The question naturally presents itself; where and how did the C. M. & M. Co. get the bullion? For milling ore, the company, it is said, is paid not in bullion, but in cash, as the vouchers or monthly statements of the mining companies would indicate. Then how does the milling company get bullion? It makes the many believe that not one-half was told in the now celebrated suit of M. W. Fox against the late directors of the Hale & Norcross Mining Co. Even with this knowledge there is a growing conviction with outside investors and operators that if the rings will turn the mills over to the mining companies, and also allow certain other reforms, it would be better to withdraw all suits and let bygones be bygones. By doing this, they think that a boom in the share market would follow.

News from the Bodie district is confirmatory that Mr. Leggett, superintendent of the Standard Mining Co., is, with his usual energy, pushing the work on the electric plant. It will have sufficient power to drive several mills the size of either the Standard's or Bodie's.

News from the outside mining district grows in interest, and if there was any life to the market, the shares of several of the mines would be selling for dollars where they now sell at cents.

News from the Comstock mines is of unusual interest, and points with certainty that the mill rings are getting ready to show up some ore either this fall or next spring. The showing up of ore, it is said, would have been done some time ago had it not heen for the active opposition of D. O. Mills. It is quite generally claimed that Mr. Mills believes more in the returns of the mills than in stock hooms, and therefore it is better to have no ore development made public. The Savage Company reports higher assays and more ore milled, while Con. Virginia reports lower assays. It looks like a seesaw game. From the Gold Hill group of mines, reliable private news is confirmatory of active developing work, and that in several of the mines they are getting ready to extract rich ore. From the Middle group of mines there is nothing new to report.

This afternoon mining shares broke badly on the announcement that the following assessments had been levied: Hale & Norcross 50 cents and Bullion 25 cents.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR WEEK ENDING AUG. 2, 1892.

480,006. — HARVESTER — Daniel Best, San Leandro, Cal.

480,067.— CARRIAGE CURTAIN FASTENER—A. Buker, Hueneme, Cal.

479,970.—PRESERVING EGGS—E. T. Burnette, Haywards, Cal.

480,072.—CLOTHES PIN—J. W. Cook, Harrisburg, Or.

480,183.— PAVEMENT—R. D. Duff, Tacoma, Wash.

479,976.—INSECT GUARD—J. Elwood, Sanger, Cal.

480,081.— BOILER—F. X Fischer, Oakland, Cal.

479,938.—CLASP—J. L. Fredlihp, Porterville, Cal.

480,119 — METRIC MODEL — Jas. McCourt, Salem, Or.

480,120.—WALL OR CEILING COVERING—J. P. McMurray, S. F.

480,112.—DRIER — S. A. Meuzemer, Santa Clara, Cal.

480,208.— CASH REGISTER—W. K. Nichols, S. F.

479,918.—WAGON AXLE—N. Olsen, Portland, Or.

480,134.—BRICK KILN—W. Radford, S. F.

479,906.—VINA CUTTER—W. H. Starks, Bellevue, Wash.

480,222.— DOOR CHECK — C. H Timins, John Day, Or.

480,223.—STEAM STAMP—C. W. Tremain, Portland, Or.

480,153.—STEAM ENGINE—Tremain & Johnson, Portland, Or.

The following brief list by telegraph, for Aug. 9, will appear more complete on receipt of mail advices:

California—William N. Anderson, San Raiael, elevator; Mahlon G. Bailey and H. T. Welch, San Jose, book indicator; Arthur W. Coffin, San Francisco, ticket punch; Wilson R. Ellis, Woodland, meat and vegetable cutter; Charles S. Hardy, San Diego, mailing attachment for hooks and like articles; Emory J Nichols, San Francisco, igniter for gas engines; James R Phelps, Sacramento, legspreader for horses; William Willoughby, San Francisco, telegraph transmitter; Henry York and F. W. Austin, Colton, lifting jack. Nevada — A. P. Anderson, Oriental, quartz crusher. Washington—Russell H. Avery, Spokane Falls, coin chute; James H Livermore, Port Townsend extension shoe last. Oregon—Andrew C. Mack, Portland, key fastener; Charles A Marlitt, Portland, temporary stamp; William L. Ulenhart, Astoria, nonrella rib.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co in the shortest time possible (by mail for telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Rsonst Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

BRICK KILN.—Wm. Radford, S. F. No. 480,134. Dated Aug. 2, 1892. This invention relates to certain improvements in brick and other kilns for similar purposes in which there are a number of adjoining chambers adapted to communicate with each other through suitable doors or openings, and also communicating with a common flue. In a former patent to the same inventor a perpetual kiln is shown, consisting of a series of communicating chambers surrounding a central chimney and having flues connected with said chimney with means for cutting off or uniting any two or more of the chambers so that the burning may be carried on continuously in a certain number of the chambers, fresh chambers being added from time to time and others being cut off as the work is completed within them. In the present invention, Mr. Radford has made improvements in the arrangement of communicating passages, dampers or gates for cutting off or opening said passages, ventilating openings, etc. The draft may be regulated at will at all times, and may be directed to any portion of the burning chambers.

BOILER.—Frank X. Fisher, Oakland. No. 480,081. Dated Aug. 2, 1892. The object of this invention is to provide an economical and effective boiler, more particularly a portable boiler of that type known as "return flue" and which is especially adapted for burning straw and is consequently most used in the harvest field either for a traction or a thrashing engine, a harvester or other movable implement. The patent covers certain combinations of devices and peculiarities of construction.

WALL OR CEILING COVERING.—John P. McMurray, S. F. No. 480,120. Dated Aug. 2, 1892. This invention relates to an improvement in the construction of walls and ceilings whereby the inventor is enabled to produce a hard, firm surface and to reduce the liability of such surface to crack and break.

TRAVELING HARVESTER.—Daniel Best, San Leandro. No. 480,006. Dated Aug. 2, 1892. This improvement in traveling harvesters and thrashers consists in certain details of construction and the means for applying the power of the two driving wheels independently to the heading and conveying portion of the apparatus and to the thrashing and cleaning portion respectively.

DRIER.—Augustus Menzemer, Santa Clara. No. 480,112. Dated Aug. 2, 1892. The object of this improved drier for fruit and other articles is to better distribute and equalize the heated air throughout the entire contents of the apparatus.

MINING SHAREHOLDERS' DIRECTORY.

New Incorporations.

The following companies have been incorporated, and papers filed in tbe office of the Superior Court, Department 10, San Francisco:

COTATE Co. Capital stock, $100,000. Object, to carry on a real estate business. Directors—Charles Page, Wilfred Page, Arthur Page, George Thomas Page, John D. Mailliard.

AMERICAN IMPROVEMENT Co. Capital stock, $250,000. Object, to carry on a street-sweeping business. Directors—Michael J. Donahoe, John W. Morshead, George S Switzer, John G. South, Simeon S. Buuge.

ALLEGRETTI CALIFORNIA FLOWER AND TRANSPORTATION CO Capital stock, $300,000. Object, to operate and utilize, as far as they are adaptable, certain patents for the preservation, storage and transshipment of flowers, flowering plants and vegetables. Directors—L. Allegretti. Frank Allegretti, G. Allegretti, Charles F. Runyon and James A. Watt of this city.

WESTERN BAKERY Co. Directors—Frederick Hilsz, K. Hilsz, R. Anixter, Charles Hilsz and S. Joseph Theisen.

MCGLEW ORE CONCENTRATOR CO — Capital stock, $250,000. Directors—Thomas McGlew, John B. McGlew, Harry Barnere, Frank Berrere and William S. Mollison.

B. H. PATRICK & Co.—Capital stock, $10,000. Object, to manufacture and vend stamps and stencils, principally in this city. Directors—Benjamin H. atrick, James M. Patrick, J. G. Mudgett, James H. Pitman, H. Thles.

HUMPHREYS HYDRAULIC DREDGING Co. Capital stock, $300,000 Directors—W. P. Humphreys, George W. Hopkins, J. P. Allen, L. P. Drexler and M. J. Haley.

*Collecting an assessment.

NOTE.—Con Cal. & Va. has unsold bullion amounting to $26,531.99. Navajo has due on pumping accou t $7,800, and from sal s of ores $7,218.69. North Belle Isle has $2,346.89 due from sales of ore.

WANTED.

A position by a Mining Engineer and Metallurgist. Lead and Copper Smelting. Address Box W., this office.

HORACE D. RANLETT,

Ores, Mining, and Commission,

420 Montgomery St., S. F.

Ships under advances to smelting works in Boston New York, Baltimore and Liverpool.

Twenty-five years' experience in Shipping Ores and Managing Mines.

Solicits Consignments of Copper Produce and Management of Mining Matters.

All business conducted on Cash Basis.

Purchase and shipment of Mining Supplies A SPECIALTY.

Sales of Developed Copper Mines undertaken.

Business Manager of UNION COPPER MINE, Copperopolis, Cal.: NEWTON COPPER MINE, Amador Co., Cal.

HORACE B. GALE,

EXPERT AND CONSULTING ENGINEER

—IN—

Steam and Electrical Engineering.

PROFESSOR OF MECHANICAL ENGINEERING

— AT THE —

Stanford University.

Tests Conducted, Specifications Drawn, Etc. Address: Stanford University, Menlo Park, Cal.

Assessment Notices.

CALIFORNIA VERDE ANTIQUE MARBLE COMPANY Location of principal place of business, San Francisco, California; location of works, Placer County, California.

Notice is hereby given that at a meeting of the Board of Directors, held on the 12th day of July, 1892, an assessment (No. 2) of One Cent per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the Company, 3 8 Pine street, San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the 22d day of August, 1892, will be delinquent and advertised for sale at public auction, and unless payment is made before, will be sold on MONDAY, the 12th day of September, 1892, to pay the delinquent assessment together with costs of advertising and expenses of sale.

By order of the Board of Directors.

W. J. GURNETT, Secretary

Office 3 8 Pine Street, San Francisco, California.

GOVER MINING COMPANY. LOCATION OF PRINcipal place of business, San Francisco, California; location of works, near Drytown, Amador County, California.

Notice is hereby given that at a meeting of the Board of Directors, held on the 23th day of July, 1892, an assessment (No. 3) of Ten Cents (10c) per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Treasurer of the Company, at his office, Nos. 13 and 15 Fremont Street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on Tuesday, the 1st day of September, 1892, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 26th day of September, 1892, to pay the delinquent assessment together with costs of advertising and expenses of sale.

ROGERT McF. DOBLE, Secretary.

Office—Nos. 13 and 15 Fremont Street, San Francisco, California.

WANTED.

Position as Superintendent or Metallurgist.

First class Mining Engineer and Metallurgist, several year's experience in Europe, America and Mexico, is open for engagement. Graduate of one of the best mining schools in Europe. Best references. Address,

Secretary Concordia Club,

San Francisco, Cal.

WANTED.

The owner of a group of Nine Gold Veins, two of which average $30 per ton gold, wishes to give a workiog bond on very reasonable terms, to party who will develop the property. Wood and water convenient and abundant. Only bases in ores are iron and sulphur.

Address Box I. PONY, Montana.

WANTED.

Position as Manager or Assayer, at a gold or silver mine. Many years parctical experience in the manage ment of mines and the milling of gold and silver ores.

Address Box O, this office.

JAMES M. HAVEN. THOMAS E. HAVEN, Notary Public.

HAVEN & HAVEN,

ATTORNEYS AND COUNSELORS AT LAW.

No. 530 California Street,

Telephone No. 1746 SAN FRANCISCO, CAL.

EVERY one in need of information on the subject of advertising will do well to obtain a copy of "Book for Advertisers," 368 pages, price one dollar. Giant Forms of Extinct Animal Life.

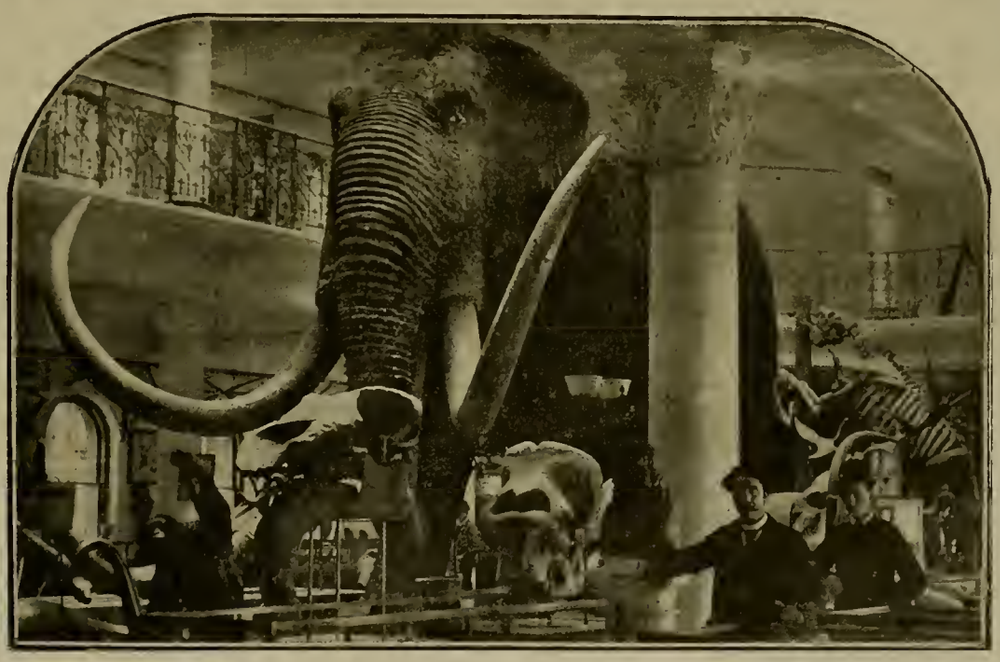
Mammoth remains are among the very earliest forms of extinct animal life which attracted the attention of observers of our earth and its natural products. The whole continent of Europe from France and England to the Ural mountains, and from Sicily to northern Russia, is strewn with mammoth bones in its alluvial and post pliocene deposits. Research has also shown the mammoth in India, Persia, Siam, all northern Siberia, Cbina and Japan. In both the continents of Europe and Asia these remains are found to be more sparsely distributed in the southern lands and to abound in vast numbers on the northern limit, showing thus a strange disagreement in distribution with the elephant of the present day, which is confined, in its wild state, to the tropical portiona of Africa, and to the equally bot countries of India, Sumatra and Borneo. All the northern shore of Siberis, particularly in the deltas of the Lena and the Yenessei rivers and the islands lying off these coasts, is crowded thick with the leg bones, tusks and teeth of these extinct animals. In some places the continued action of sea waves and river freshets have piled these bones together in quantities so vast that their number and volume is something incredible. It is plain tbat the mammoth was once an inhabitant of north temperate and frigid zones; now its descendants, reduced in numbers and degenerate in size, inhabit the tropics. More than a hundred years ago, not only their ivory, but their carcasses, were known to exist in Siberia, imbedded in solid ice. The first discovery of such remains was six degrees north of the Arctic circle, where the body, largely imbedded in ice, was still standing erect, and was almost perfect. The skin remained in place and the hair and fur were still attached in spots.



THE MAMMOTH—A RESTORATION IN THE ACADEMY OF SCIENCES MUSEUM.

The most celebrated discovery was at the mouth of the river Lena in 1799, when a fisherman found a complete body of a mammoth in the ice. The nomadic tribes had been feeding their dogs on the flesh. The skeleton, hide, etc., were carried 7000 miles to St. Petersburg and placed in the museum of the Imperial Academy of Sciences. This is the famous Siberian hairy mammoth, and stands unique in the history of fossil remains from the fact of the preservation of the soft parts of the animal—its flesh and sinews—in connection with the bones.

In the museum of the Academy of Sciences of this city is a "restoration" of this mammoth, made by Prof. Henry A. Ward, of Rochester, N. Y. The height is 16 feet, and length, including forward curve of tusks, 26 feet. The engraving on this page is from a photograph made in the Academy of Sciences museum on Market street. As may be imagined, this mammoth is the central figure in the collection exhibited in the museum-room.

A LARGE colony of disappointed Oklahoma home-seekers have left for Central America.

THE BROKEN HILL MINES, New South Wales, the largest silver-producing mines in the world, have 6000 men out on strike, and the mines are idle. The question in dispute is as to the working of the mines. The mine-owners have decided that the stoping of ore shall be let by contract. The men refuse to agree to this, and ask that it be paid for by day work as at present. The companies are now forced by the unions to do stoping work on what is known as the "double-handed system." That is to say, the men have to work on the face in couples, whether the conditions are snitable or not. The arbitrary enforcement of this rule has a disastrous effect on the economic working of the mines. The owners know that if they are allowed to stope ore by contract, the men who tender for the work would do it by what is known as the single-handed system. The effect of the carrying out of this latter system would be that the work would he done for about half its present cost. The large decreaae which has taken place in the prices of silver and lead has not been without its weight in causing the directors to come to their determination.

PLACER COUNTY MINES.—From Thos. B. Everett, secretary of the Placer County Miners' Association, we learn that the Pioneer mine is running steadily under the management of Mr. Sullivan. The Drummond, up near the head of Shirt-tail canyon is doing well. Remler & Co. of Forest Hill are taking out good ore. The Harlow drift mine at Loomis is in some sort of difficulty just now, but the mine pays and will be going again shortly. The mines at Ophir are very quiet at present, but there is some talk of starting up the Hathaway very soon. As soon as they put in a new crusher they will start up the Gold Blossom. They are using the cyanide process at this latter mine.

THE Contention Consolidated Mining Company of Tombstone district, Arizona, has declared a dividend of twenty cents per share, aggregating $50,000. The last previous dividend of this company was paid in December, 1884, and was at the rate of twenty-five cents per share, aggregating $62,500.

Sites for Manufacturing Establishments.

Large manufacturing establishments require more ground space than is usually available in a large city. The movement away from the crowded center commenced here when the Union Iron Works went out to the Potrero and estsblished their ship-building plant. The Risdon and Fulton Works, the next in size of our foundries, are both seeking better locations. The fire at the Fulton decided the move, as far as they were concerned, and it is probable they will go to Oakland and establish a ship-building plant on tbe edge of the harbor there. Tbe Risdon people are also on the lookout for a water-front location and will bardly remain much longer where they are. These firms both intend increasing their facilities in the direction of marine work. To do this properly they must have water-frontage where vessels can he hauled out or launched. Available water-frontage near this city is rather scarce. The Potrero point of land near deep water is already occupied by the Union Iron Works, Pacific Rolling Mills, gas works, sugar refinery and cordage works. In the large bay beyond that, and this side of Hunter's point, there are wide mud flats extending far out from the beach. At Hunter's point the dry-dock property takes up the water-frontsge, and beyond that, far down until Baden is reached, there are more mud flats. The city-front proper cannot, of course, well be obtained for manufacturing purposes. Along the north-beach frontage there are few available sites for factories. Under these conditions, therefore, we may expect to see some of our large establishments leave us and go across the bay to Oakland and Alameda. The water-front of Oakland harbor has been kept vacant for years by the corporation owning it, but the Railroad Company is showing now a disposition to lease or sell without restriction, so that it can now be utilized.

The fact that the Fulton Iron Works is negotiating for a tract on the Oakland water front has led other manufacturers to look in the same direction. Already the firm has applications for ground from an iron-pipe manufacturer, a bell-casting company, a brass foundry and pump works. This shows that these other firms want more space than they can readily obtain in the city. For the reasons stated, if they want water-frontage they must go across the bay.

Very naturally, all such enterprises will have their offices in this city, and the business portion will be conducted here. But the manufacturing department will not he in the city, and the mechanics and laborers will reside near the works themselves, and not in the city. This will be our loss but Oakland's gain.

THE Ely Mill and Mining Company at White Pine, Nevada, has completed cyanide works at its mill. It has put in four tanks, each tank having a capacity of thirty tons.

Comment.

English investors in Colorado mining properties are becoming restive because, while large quantities of ore are being produced, and the local managers live in ease and luxury, the dividends come slowly or not at all. A number of these investors have sent a man over to Denver to find out the reason why, with some $50,000,000 invested in Leadville, Aspen, the San Juan country and other camps, the returns to stockholders are small. The promised investigation will be apt to bring out facts which will render certain persons uncomfortable, as did the investigation here into the Comstock methods of management. It seems odd that in mining affairs the managements get rich, while the stockholders do not. It is unfortunate that this is the case in most of the mining regions where work is done on a large scale. The experience in this city shows that it needs vigorous, aggressive and earnest men to take the companies in hand before reforms can be carried out. Custom gives mining directors and presidents so many ways of making money that any change is very difficult to bring about. For the good of the mining industry in general, the more searching the investigation the better will be the results; and if Colorado expects to get more capital interested, the sooner the bad customs are broken up the better.

Agents are in this city from Ecuador to obtain appliances for working the gravel mines of that country by the hydraulic system. Mr. Russel F. Lord, who has been making an examination of the mines in the province of Esmeraldes, says that the beds will yield an average of 40 cents a cubic yard, and some tracts will run higher. The auriferous territory is in the lower and westerly foothills of the great Andean Cordillera, about 40 miles from the coast. There are several deposits, and the water supply is abundant. Preparations are now being made to outfit and work these properties on an extensive scale by hydraulic process. The estates are traversed by large and swift-flowing streams full of water the year round. The conduits will probably consist in large part of flumes and iron pipes. The pipe, giants and other appliances will be purchased in this city. Natives will do most of the work in the mines, a few white men being employed for superintendents, overseers, pipemen, mechanics, etc., this part of the force having already been engaged in San Francisco. While we now do comparatively little hydraulic mining in California, except in the northwestern tier of counties, there is a demand for skilled hydraulic miners, especially pipemen, from other countries. Many of these men have gone abroad to South Africa, Australia, and South and Central America. Others have gone to Colorado, Oregon and other States. Ecuador is a new field for this kind of work, and the promoters of the enterprise referred to do wisely to come here for suitable men and machinery.

The time is prolific of labor troubles. Besides the two great strikes already on at Homestead, Pa., and Cœur d'Alene, Idaho, three others have developed during the past week. At Buffalo, New York, nine hundred railroad yardmen are striking over a question of wages. They have resorted to violent methods, and besides dealing roughly with nonunion men put at their abandoned work, have damaged the property in their charge and have burned nearly three hundred freight cars loaded with goods worth half a million dollars. State troops are on duty to protect property, but they have not been able to stop rioting or to prevent the abuse of nonunion workmen. In Tennessee there is another labor riot. Here the iron and coal miners are preventing by violence the Tennessee Iron, Coal & Railroad Company from employing convicts in their mines and timber camps. In three instances the guards have been overpowered, the camps destroyed, and the convicts returned to the State penitentiary near Nashville. All this has not been accomplished without a good deal of brutal violence, of which both the guards and the convicts have been the victims. Nearer home, at Port Gamble, on Puget Sound, there was a riot on Friday last of a very different kind. Three vessels lying at anchor were boarded by gangs of union seamen and their crews dragged or driven ashore and warned not to return. The men thus forced from their work belonged to a union, but not to the particular fraternity which dominates the shipping of Puget Sound. Here, therefore, we have warfare carried on with the fierce methods of piracy, not against nonunion men, but against the members of a nonaffiliating and less powerful organization. If there be among the champions of the rights and interests of workingmen anybody hold enough to claim that there is any sort of justice in these proceedings, he is no friend but an enemy of labor. Organization of workmen into unions is as legitimate as the organization of capital into companies and corporations. Organization is labor's legitimate weapon of defense, but the right to organize no more carries with it the right to violent enforcement of demands, just or otherwise, than the right to bear arms carries with it license to murder. The right to strike is a legitimate one, as sacred as the right to labor, but it does not carry with it the right to prevent others from making such engagements as they choose. The labor unions are going to treasonable lengths in assuming the right to enforce their own rules, and it is the duty of the Government to employ its whole power, if necessary, to defend the constitutional rights not only of property-holders, but of nonunion workmen. This country cannot allow the trades-unions to usurp the functions of Congress; it cannot allow the rights of its citizens, either capitalists or nonunion workmen, to be trampled upon. If it should fail in this duty, it would not be worthy to live, and could not live. It must assert, definitely and positively, that the right of the property-owner to his mill, his mine, his railroad or his ship, and that the right of the humblest citizen to labor, are as sacred as the right of the trades-unionist to strike.

The fame of the natural wonders of California is world-wide. The Yosemite with its cliffs and waterfalls, the geysers, the big trees and other wonders must now, however, resign their supremacy in favor of a bald-headed spring. That is, not exactly a bald-headed spring, but a spring which cures baldness. The Jamacha spring is on an old Spanish grant about 13 miles from San Diego. A committee of the Board of Health has reported that the waters really do cause the hair to again grow on bald heads. The water is alkaline, ferruginous, sulphuretted and arsenical. If present reports are fully verified, the Jamacha ranch will become a bald men's paradise, and one more natural wonder is added to the list in California. More people will come to this than to the Yosemite; for there are more bald-headed people with money to travel after hair than there are people with money to spend on mere scenery.

The telegraph brings news from Albuquerque, N. M., about the test of the new Crawford gold extractor on 15 tons of ore from the Snake mines. The account says: "The ore was crushed and was very refractory, still the cleanup showed that the mill had extracted over 80 per cent of the assayed value of the ore, while the old Huntington mill extracted but 60 per cent from the same ore. The assay test from the tailings, added to the product of the run, was greater than the original assay value of the ore. A number of miners from different camps were present at the test runs and were highly pleased with its methods of reducing ore." From this it would appear that the Crawford extractor was a sort of combined machine and process, yet comparing it with the Huntington mill, which is simply a mill, would lead one to believe it was only a crushing appliance. If that is the case, what the percentage obtained from the ore has to do with it is rather puzzling. The crushing of ore is generally preliminary to obtaining its valuable contents and has little to do with the proposition of results. But it is encouraging in this instance for Californians to know there is at last a machine or process which takes out more gold than the ore originally contained. That is the only conclusion when the value of tailings, added to the product of the run, is greater than the original assay value. This machine works the ore to over 100 per cent of the assay value. No wonder it beats the Huntington or any other mill, and no wonder the miners from different camps were highly pleased. They have long been looking for some machine which will do this.

Foundry Notes.

The foundry and boiler-making departments of the Fulton Iron Works not having been very much damaged by the recent fire, work has been continued in them by the firm. The machinery, tools, etc., were, however, destroyed, and since then the tools and shop of the old Pacific Iron Works have been used by the Fulton people. Castings made at the foundry have to be carried around to First street for machine work and finishing. While the arrangement is, of course, inconvenient, it has enabled the Fulton Works to complete their contracts and go on with whatever work is offered. They have just completed four very large boilers for the new electric light plant in this city belonging to the California Electric Light Company, and four more are to be built. The new boilers are of vertical type with very small flues. The plate of which they are made is very heavy, and the boilers are tested up to 150 pounds.

A boiler has also just been made for the new tug for the Harbor Commission. The quarantine boat, with its fumigating apparatus, completed by the Fulton Works, has been tried and found to be successful. A Corliss compound engine for the Currier silk factory at Petaluma is in the shop now. Considerable work is being done also for Mexican orders.

The city of Oakland has raised the $10,000 bonus to bring these works there. Titles to land, etc., are yet to be examined, but everything points to the new works going across the bay. The new works will occupy 42½ acres of land on the Hayes estate. The property lies 750 feet from the railroad line and runs from the south of First street to the edge of a strip of water known as Oakland harbor. The Fulton Iron Works proposes to build a long canal into its property with wharves on each side. On the east side of the canal the ship-building yard and workshops of the company will be erected and a large portion of the land will be reserved for the expansion of the company's business. At present much of the property is a marsh, and it will take some time to put it in shape for building purposes. The title is being searched, and if everything is found to be in good condition, it is probable that the new Fulton Iron Works will be erected in Oakland.

At the last meeting of the State Prison Directors the bill was paid for 25 looms for the new jute mill made by the Oakland Iron Works, that concern having placed the machinery on the ground. These are the first looms of home make ever put in the prison, and they are considered to be very much better than those of English manufacture, which have until now been used in the prison. One of them has been in use for two months, and has been perfectly satisfactory. The California looms cost $175 75 apiece, against $240 for those of English manufacture. The bill for the new looms was ordered paid. They will be placed in the new jute mill with 75 others yet to be made. The amount thus received by a California industry is $17,500.

On Tuesday the new electric street railway in this city was formally opened. It is the Metropolitan Railway, which starts at Powell and Eddy streets and runs to the powerhouse on Carl street and Forest avenue via Golden Gate park. The cars are the latest design in finish and utility, being fitted with three trucks, which do away with that rocking motion in the double-truck car. In the two end trucks are located the motors, each of 25 horsepower, that can easily drive the car at the rate of 20 miles per hour. For the present the road will be operated by electricity from Van Ness avenue out. An injunction taken out by the city restrains the erection of poles from the avenue to the starting point at Powell and Eddy streets, but this distance will be covered by horsecars until the injunction is lifted. When completed, the line will carry passengers from the Baldwin Hotel to the Olympic Club grounds and the beach for one fare, whereas they now pay two. The service is much quicker, and it is the intention to put on a large service, one-minute cars if necessary. The company now has 12 cars at the powerhouse, but will start the road with double that number. Everything connected with the enterprise except the cartrucks was turned out in this city. The engine, a handsome piece of machinery turned out by the Risdon Iron Works, is of 500 horsepower, which drives three dynamos. Two are sufficient to operate the system, but there is room for the addition of a double plant should the line be extended.

The gauge of the Geary-street Cable Railroad has recently been altered, thus necessitating the placing of a new turntable at the junction of Geary, Kearny and Market streets The big steel frame was manufactured at the Pacific Rolling Mills. It is 33 inches thick, 30 feet in diameter and weighs 15 tons. The cost of the frame alone was $2000, and the total cost of the table $3000.

Coast Industrial Notes.

There are 110 men belonging to the Brewers' Union of this city now out on strike.

THE horseshoers of this city are all busy. There are very few idle men belnnging to the the union.

THE engineers of the San Francisco and Great Salt Lake railway are now surveying just east of Reno.

CLAUS SPRECKLES has got two agents in Kern county looking for a suitable location for a beetsugar refinery.

THERE were 238 banks doing business in California on July first last, with resources amounting to $301,046,944.

THE North Pacific Coast railway has contracted for a new ferry steamer, and will soon enlarge its slip at Sausalito.

TTTE big lumber raft at Fort Bragg, Mendocino county, will be ready for launching this Saturday, and will then be towed tn this port.

THE electric road from Ventura into the Ojai valley has been graded for four miles from Ventura and the track is down for two miles.

THE foundations of a 2,000,000 cubic feet gasnmeter are being put in on Bay and Buchanan streets for the San Francisco Gaslight Company.

LABOR COMMISSIONER WALTS has started an inquiry in the matter of unemployed workingmen, with a view to ascertain, if possible, the cause.

ON the 1st of September the California State Board of Trade will move their exhibit into and occupy the entire basement of the Crocker building.

THE Nevada County Miners' Association will have a small stamp mill in full operation as one of the features of the World's Fair exbibit of that county.

CONTRA COSTA COUNTY is becoming quite an object of interest for capitalists of late, owing to the many projected railroad schemes and the fact that most of the lines enter and cross the county.

LAST month there were shipped to Salt Lake from Eureka, Nev., 1649 tons of ore—from Union district 15 tons; from Diamond district 34 tons; from White Pine district 406 tons, and from Morey district 28 tons.

IT is reported that the Ducey Timber Co. of Micbigan has purchased the mills, flume, timber, track, logging railway, etc., of the Kings River Timber Co., on Kings river, Fresno county. This is the plant of Moore & Smith.

A SATISFACTORY understanding has been reached by the parties interested in the proposed starch factory at Petaluma, and the necessary buildings and machinery will be in readiness to commence work as soon as tbe potato crop is ripe.

THE directors of the Electric Lighting and Tramway Company place the loss by the fire at Victoria at $80,000, insurance on the burned property $45 000. T. Teague, architect, will prepare plans at once for a first-class brick, iron and stone building.

THE Journeymen Coopers' Union will open its cooperative shop on Perry, between Fourth and Fifth streets, on the 22d inst. The coopers have received financial aid from the various unions to assist them in sustaining the strike against the nonunion shops.

THE Piedmont Cable Company of Oakland will build a branch electric road from the carhouse on Fourteenth and Center streets to Seventh and Wood streets. The branch line to the cemetery gates has been finished and was in operation for the first time last week.

THE Haywards electric railway will soon be in operation as far as Broadway, Oakland. About 100 men were put to work Monday, and are laying the track at the rate of two blocks per diem. It is expected to have the road in running order toward the end of October.

A. LUSK & CO. have increased the working force at their fruit-canning establishment at Brannan and First streets. Business was so rushing that the addition of 500 women and girls was necessary to take care of the immense supplies of stock shipped in from all directions.

AT a meeting Saturday of the directors and stockholders of the Giant Powder Company and the Safety Nitro Company, it was decided to consolidate the two concerns. The decision was rendered by the heavier stockholders of the two companies and, unless the minority carries enough weight to upset these plans, the combine will go through.

THE large pottery works at Lincoln, one of the institutions of Placer county, while not inordinately rushed, is doing a good business. It receives orders from all parts of the Pacific coast. The quarries at Lincoln, Rocklin, Loomis and Penryn continue to turn out most of the granite used in tbe State, and all of them are working average forces.

FORTY stonecutters are out on strike at J. G. Day's stonequarry at Raymond, Fresno Co., because the owners refused to reduce the hours of labor from nine to eight hours, and pay the same wages—$4 per day. Last April the men informed Day that the union had made a new schedule to go into effect in all quarries in the State. According to the new schedule, the stonecutters were to work eight hours instead of nine and receive the same pay.

THE Tolmans Landing and Vallecitos Railroad Company has filed with the county clerk a certificate of the creation of a bonded indebtedness to the amount of $500,000, as determined upon at a meeting at which 153,000 of the 225,000 shares were represented, being 3000 more than two-thirds of the capital stock issued. George B. Tolman is president, B. Austin secretary, and with L. B. Hopkins, Marian Tolman and Robert Gilbert constitute the directors.

THE Eighteenth street branch of the electric road which runs from Eighteenth and Guererro streets to Golden Gate Park was opened on Monday. President Joost has been authorized to let contracts for a new steam engine and new generators to be put in the powerhouse at Thirtieth street and San Jose avenue, and also for 20 new cars, the latter of the double-generatnr heavy class. The estimated outlay for the new work is $200,000, so that the letting of the contracts will be awaited with interest by local engineering firms. The new work is to be carried out as speedily as possible.

San Francisco Cable Roads.

THE Sutter Street Cable Railway Co. and the San Francisco and San Mateo electric road have made a transfer arrangement whereby transfers are exchanged at Ninth and Harrison streets between the cars of the Larkio street system and the electric road traveling in both directions.

THE new engine and carhouse for the Geary street cableroad, at the corner of First and Point Lobos avenues, is rapidly approaching completion. When finished, it will be the largest powerhouse in this city, its dimensions being 300x107.6, and two stories in height. The company will take possession of its new quarters in four or five weeks and will then move out of the Buchanan and Geary street structure.

A CHANGE contemplated by the Cliff House and Ferries is the extension of the cableline three blocks farther north to Taylor and Jefferson streets. This will mean lifting the turntable from its present location and moving it to that named. In this case all that is awaited is tbe completion of section B of the seawall and the filling of the intermediate water space between it and the half block of ground north of Bay street. A large force of men is at work on the seawall and it is now rapidly approaching completion.

THE Mayor has signed an order granting the Ferries and Cliff House Cable Railway Company permission to construct a street car line on Bay street, and work is tn be commenced as soon as the material which has been ordered arrives on the ground. Superintendent H. H. Lynch says it is the intention of the company to build the line at once. It will start at the junction of Taylor and Bay streets, the present North Beacb terminus of the company's cableroad, and run due east along Bay street to Montgomery. As soon as the work at the seawall and ferries is finished, application will be made for a franchise to extend the line from the junction of Bay and Montgomery streets clear round the waterfront to Clay street. In the district encircled by the line described there is no streetcar accomodation whatever. The Omnibus Cable Company's horsecar line stops at Powell and Bay streets, and the Mission and North Beach horsecar line just a block from that point. From these two termini and that of the Cliff House and Ferries east to the waterfront there is no other road. Within tbe past two years several large factories, and notably two large iron works, employing several hundred men, have been erected on the blocks north and soutb of Bay street, and from Stockton street east. The short horsecar line from Bay and Montgomery streets is to be constructed expressly to meet the demands of this district. The cars will transfer to the Cliff House and ferries, and thence to the Market street system or out Jackson street to the western Addition, practically placing this hithertn out of-the-way district in communication with the entire city.

Mining Briefs.

THE Crossbow Mining Company has levied an assessment of 10 cents per share.

THE mining town of Red Mountain, Colo., was almost entirely destroyed by fire last Sunday.

THE Idaho Gold Mining Company of Grass Valley has declared dividend No. 265 of $2.50 per share, aggregating $7750.

THE directors of the Nevada County Miners' Association have elected Fred Searls to fill the vacancy in the Board caused by the death of George G. Allan.

A FEW days ago D. G. McIntosh discovered a coal vein two and a half miles north of Klamath Falls, Or., on the ranch of J. G. Shallock. It burns readily and clean, and is free from all foreign matter.

THE big smelter at Mineral, Idaho, was burned last week. The loss will reach $50,000, with no insurance This was the only smelter in the Boise Basin mining region, and will very greatly retard the output of bullion.

THE tailings accumulated at the Washoe mill from working the ore from the Justice mine, estimated at 2000 tons, have been purchased by Col. E. D. Boyle of the Comstock Milling Co. for $2000. The tailings assay $13.50 per ton, and are being worked at the Douglass mill.

A special meeting of the Company of Associated Stockbrokers of the San Francisco Stock and Exchange Board has been called for August 22d, at which a resolution, introduced July 11th, empowering the board of directors of tbe association to sell the Board building and real estate on Pine street for a sum not less than $450,000, will be voted upon.

THE sale of an onyx mine in Lower California has been consummated to an Eastern syndicate for $50 000. The mine is considered one of the most valuable of its kind in tbe country, and at the time of the transfer was the property of the estate of C. Murrillo, A. Viliavicencio, P. Espinoza and J. L. Clark. The mine is located about 170 miles south of tbe line. The new owners will proceed at once to develop the property.

THE Ophir pan mill at the foot of Gold canyon, Nevada, which has been running steadily for the past 15 years, when there was water in the Carson river for power, has closed down permanently. The material worked was tailings from the Consolidated Virginia and California ore pulp flumed there while a portion of the ore from the bonanza discovered in those mines in 1874 was being crushed. The mill handled 130 tons of tailings in 24 hours, and the bullion product therefrom during the entire run of the mill is said to have netted J. W. Mackay & Co. $2,000,000.

Personals.

JOSEPH LOW, the mining operator, has returned from an extended Eastern trip.

COLONEL D. H. JACKSON, superintendent of the Holmes mines, is ill with typhoid fever at Candelaria, Nev.

GEORGE H. BUMP, who is interested in mining properties at Pine Nut, Nev., reports a bright outlook for that district.

ALF TREGIDGO of Grass Valley has been in the city this week on business connected with his electric-power and mining plant.

D. B. HUNTLEY, the Portland, Oregon, assayer and metallurgist, is now superintendent of the Morning mine, at Mullan, Idaho.

JOHN H. TILTON, one of the original locators on the Comstock lode, and father of the first child born at the famous camp, died at Virginia last week.

MR. THEODORE G. ED WOLLEB, the mining expert, who is a resident of East Oakland, left this week for Plumas county to make an examination of a quartz mine.

RUSSELL L. DUNN, the U. S. Deputy Mineral Surveyor of Auburn, Placer county, is at present in Siskiyou county engaged in fieldwork for the State Mining Bureau.

E. A. STENT has sold his quartz mine at Salmon river, about five miles from Sawyer's Bar, to C. J. Clark, who represents the Gladstone Company of Shasta county.

WILLIAM P. SHAW, the silvermine-owner who is interested in sinking six or eight artesian wells near Nevada, has returned from the Cortez mining district in Nevada, where he has been for some time.

ERNEST BEYER, a mining man of Tombstone, Arizona, has purchased a fruit farm near Petaluma, in this State. He says the refusal of Congress to take action on the silver question has greatly depressed the mining industry in Arizona.

C. N. LAMBERT is now associated with ex-Representative Morelock of Linn county, Oregon, in the management of the old Ganiard mill near Gold Hill, Oregon, and they have put in a wheel to supply water for the approaching milling season.

WM. P. BLAKE, now at Shellsburg, Wis., put up the first rockbreaker in California, in the Benton mill, Mariposa county, in 1861. He also introduced the machine as an adjunct to stamps at Land's and Booth's mills for crushing Comstock ore.

A. L. COLTON has been appointed secretary and assistant astronomer at the Lick Observatory. Mr. Colton has recently been connected with the Weather Bureau, and received his instruction in astronomy under Professor J. M. Schaeberle at Ann Arbor.

Mr. B. F. LACY, president of the Parke & Lacy Co., who went to Australia last March, is still in Sydney, and will not return to California before October. The company has a branch house in Sydney, where they do a large business in mining machinery, etc.

JOS. NORTHEY, Jos. G. Northey, Benj. Hall and Wm. Black bave formed a copartnership for the purpose of working sulphurets at the Pioneer Reduction Works, Nevada county, which property will pass into their hands at the expiration of Fred Bost's lease.

M. C. CREEDE, whom the mines of the new camp in Colorado have made a millionaire, is a native of Illinois, who went to Colorado 20 years ago and has since been prospecting all over that State. He is described as "the most genial and unaffected fellow in the whole diggings."

B CHANDLER, an experienced Pennsylvania petroleum oil man, now a resident of Los Angeles, is in the city. He and George J. Ainsworth and others of Oakland have just secured a tract of several thousand acres of Contra Costa county land, on which they will soon begin boring for oil.

ARTHUR GRIGSBY had the fingers of his right hand injured in the machinery while working about the engine in the reduction works of the Palisade mine, Napa county. The two middle fingers were badly crushed, the bones of one being broken, and amputation may become necessary.

THE new concentrating plant of the Harney Peak Tin-Mining Co., South Dakota, was planned and constructed by George Labram (of the firm of Fraser & Chalmers, Chicago), with the assistance of J. S. Childs, superintendent of the Harney Peak Co. The machinery is intended to treat 250 tons a day.

MR. FRANKLIN BALLOU and his associates have made some improvements on the Austin hot-blast process, just being applied at the new Bi-Metallic smelter at Leadville. D. H. Moffatt and others own the patent rights for Lake county, Colo. The furnace with all its appliances was built at the Colorado Iron Works, Denver.

GEORGE ATTWOOD, son of Melville Attwood, of this city, has for several weeks past been examining the mines of the Slocan, Lake county, and the vicinity of Golden and Revelstoke, British Columbia, for leading officials of the Canadian Pacific railroad. He predicts the rise of a number of good camps there.

E. SCHEFFELIN, a mining man well known all over the State of California, Arizona and Alaska, is about to remove for a time to Oregon, where he has mining interests. Mr. Scheffelin was the discoverer of the mines at Tombstone and made a large amount of money in connection therewith, a portion of wbich he invested in gilt-edge Alameda property.

G. F. BECKER of tbe U. S. Geological Survey, and in charge of tbe division of California for surveying the gold belt, left suddenly for Washington last week, leaving four parties at work here. Prof. Becker is one of the chief geologists of the survey, but the lack of appropriations this year will necessitate the withdrawal of several of them. Whicb geologists will remain in the service Major Powell will determine.

The Geographical Society of California.

Although not incorporated until December, 1891, the Geographical Society of California has lost no time in taking a prominent place among the scientific organizations of this State. With a daily increasing membership amounting to 350, there is already a goodly number to contribute to the lectures and bulletins, and the active work done thus far augurs well for the future advancement of the Society. The acquisition and dissemination of geographical knowledge are its permanent objects, and for this purpose lectures are given either by native or foreign travelers or by qualified scientists. Information is received from naval officers with regard to points of geographical interest, changes of currents, climatic variations, etc., and a record kept for consultation. A library of books of travel and other kindred subjects, together with maps, is being also rapidly accumulated. The following lectures have so far been delivered before the Society: "Somali Land, or the Eastern Horn of Africa," (with stereopticon views), by J. Studdy Leigb, F. R. G. S.; "The Yellowstone Park," by Prof. David S. Jordan, president of the Leland Stanford Jr. University; "Holland and Belgium (with stereopticon views), by Edgar D. Peixotto; "Egypt" (with stereopticon views), by Hon. Jno. E. Sandstrom; "Arabia," by Col. John O'Byrne; "Brazil" (with stereopticon views), by Dr. John Branner, Professor of Geology Leland Stanford Jr. University; "Volcanic Region of New Zealand," by Thomas Crawford Johnston (illustrated with 100 very fine views).

A bulletin will be published very shortly by the Society which will contain a paper by Thomas Crawford Johnston embracing the "Origin of the Aztecs," the invention of the mariner's compass 200 years before the earliest date commonly assigned to it, and the discovery of America at least 2500 years before the arrival of Columbus, all of which he ascribes to the Phœnicians. Mr. Johnston first communicated his discoveries to his friends on the 19th of April last, and they are now to be published. On the 24th inst., at Union Square Hall, Prof. Jordan will deliver a lecture entitled "A Neglected Naturalist—Constantine S. Rafinesque." The membership fee in this Society is $10, and monthly dues $1, but associate members not taking part in the management pay $5 per annum. The life membership fee is $100. The rooms of the Society are in the Academy of Sciences building on Market street and the officers are as follows: President, David Starr Jordan, M. D., L. L. D., PH. D. (president of the Leland Stanford Jr. University); vice-presidents, Fred. W. D'Evelyn, M. B. C. M., Edin, Colonel John O'Byrne. Directors—George W. Davis, M. D.; Wm. Ham Hall, C. E.; George A. Moore, Henry F. Emeric, Peter MacEwen, Edgar D. Peixotto, Hon. W. H. Pratt, U. S. Surveyor-General; treasurer, R. H. McDonald, Jr., vice-president of the Pacific Bank; secretary, J. Studdy Leigh, F. R. G. S.; bankers, the Pacific Bank.

Quicksilver in California.

Up in Sonoma county there is quite a revival in the quicksilver-mining industry. The Crystal mine, near the Pine Flat region, has been bonded for $6000, and several other claims, which have been practically abandoned for a long time, are being reopened and development work pushed. The Cinnabar King mine, owned by a corporation composed of residents of Healdsburg, has lately struck a vein of cinnabar that assays well, and the stockholders are confident that it will be but a short time before they will open a valuable mine.

The center of the quicksilver mining industry of California has, within the past year, shifted from the south to north of San Francisco. The practical stoppage of work at the famous New Almaden mine took from Santa Clara county the lead in this product. Now the counties of Napa, Sonoma and Lake are turning out the bulk of the quicksilver produced in this State. During the boom in quicksilver, a number of years ago, many small claims were opened and operated in these counties, but on the price of the metal declining, all but the larger ones closed down. Since the great falling off in product of the New Almaden, the owners of these claims have concluded there was some chance for them, so that the old claims are being reopened. In Trinity and Siskiyou counties and in Southern Oregon, there are claims which merit attention, some of which are being worked. The price of the metal is unchanged, remaining at about the same figure it has for a long time. Should, however, any number of the smaller mines again be reopened and worked, there might be a change in the market value of the product, although there is not very much money in this class of mining with the price lower than it is now.

The White Hills, Arizona, has already become so civilized as to boast of a lady barber, the only one in the Territory.

The Mines of Amador County.

From Our Traveling Correspondent.

TO THE EDITOR:—Amador has always occupied a prominent place in the list of California's mining counties. Being an old mining county many of her mines have either been worked out or reached that stage where it was no longer possible to work them to a profit. But the closing down of these old mines after a production of several millions has been closely followed by the opening of other mines their equal, until now it is thought, and to some extent proven, that it is but necessary to sink to 500 feet and drift to secure a mine on the mother lode of Amador. Beginning at the east the first mines encountered are in the vicinity of Jackson.

THE ZEILE.—The old Leila has been run without interruption for 13 years past and still bolds several years' dividends. At the time that Mr. W. F. Deitert, the superintendent, took charge, the mine was opened but not developed. Shafts had been sunk and levels run, but no vein encountered in the lower works. Mr. Deitert's practiced eye soon saw where to drift and in a short crosscut showed up 40 feet of quartz in the lower levels. Although the ore is low in grade, running from $3 to $4, under Mr. Deitert's management the 40-stamp mill has been pounding out a steady profit to the present depth of 1160 feet. The Zeile is the only property working in the immediate vicinity of Jackson. Above Jackson, on the road to Volcano, the Clinton Consolidated, with Mr. John Francis, superintendent, is dropping its 30 stamps, but owing to the wretched condition of the road hetween Jackson and the Clinton, I did not visit the mine at this time.

THE KENNEDY.—J. Parks is the superintendent of this claim. As the Kennedy is the banner mine of the county, and its situation is beyond Jackson as you drive to Sutter Creek, both towns claim it, though it is but a short distance from Jackson. The Kennedy is now down 1550 feet, with every evidence of continuing for years to come. Drifts have been run for 1200 feet on the vein, thus determining its value throughout that distance. The largest shoot of ore is in the south end and averages 250 feet in length by 15 feet in width. In the north end the vein is small and the gold concentrated, thus giving one ton the gold value of 20. The Kennedy is a steady producer of large-sized dividends, and is at the head of the mines of the State in the size and number of its dividends. One of the best evidences of the mine's value is the fact that there is no stock for sale.

Just below the Kennedy mill is the blanket system of the inventor, Mr. Geo. Gates. This plant is, without a doubt, the most complete and convenient, and for rapid, economical and effectual work I douht if its equal can be found. The system differs from the usual blankets in the "cut-offs," or short cuts, and conveniences for saving time and labor, and the more effectually saving the valuable contents that escape from the mill. After passing over the blanket system the concentrates feed on to a concentrator of Mr. Gates' invention, where they are recleaned. The concentrator does good work and is perfectly noiseless.

SOUTH EUREKA.—Mr. J. Parks is in charge of the South Eureka. On this property can be seen the evidence of the faith in gold values of the mother lode of Amador county. Here was a piece of ground without a single cropping, and yet capital was eagerly subscribed to develop the property. A survey was run from the mines to the north and south. The lines did not join and the distance between was divided and the shaft put down 500 feet. A crosscut was then driven west in black slate, which is now in 210 feet, and then a crosscut was run east 188 feet, until the contact was reacbed, when a drift was started north and a five-foot vein of gold-bearing quartz encountered, which is now being drifted on. The nerve displayed by the promoters and stockholders in the South Eureka is the hest display of "sand and soap" to be found in the State, and those back of it deserve all the success that now seems to be in store for them. In time the whole length of the mother lode will he developed in the same manner, and as mine after mine is added to the list, capital will the more willingly embark in these prospecting ventures.

SUTTER CREEK.—The well known iron works of Knight & Co. are situated here. Mr. Knight has recently purchased the old Donnelly foundry, with all of its machinery, and is better prepared than ever before to turn out first-class mining and milling machinery of every description. These works manufacture the old and well known Knight water wheel, hydraulic engines and complete mill and mine plants.

THE WILDMAN—John Tregloan, superintendent—is now down 900 feet, with a six-foot vein, and only wants the shaft put down and levels run to bring it into bonanza. The mine labors under a great disadvantage in being operated by a single shaft and that by hucket. Given another shaft and skips, Mr. Tregloan could work all of the mine's low-grade ore to a profit. That the mine does so well, handicapped as it is, is the hest evidence of the ability of its superintendent. The mine has a fine surface plant, with a 30-stamp steel mill. Its steel shoes, dies, cams and tappets make the mill send out a roar not equaled by an iron mill of 60 stamps. In fact, I have never been in a mill which can equal the volume of its roar, and I have been in all the large mills of Dakota.

THE HECTOR.—G. T. Taylor is superintendent and S. D. Valentine manager of this property. It is better known as the Old Mahoney. The mine is now the property of Valentine Bros. & Finch. The shaft is now down 700 feet and the old 600 foot level opened up. On this level there has been no ore stoped, and tbe vein here runs from 50 to 75 feet in width. The mill is of 40 stamps, all of which will begin dropping September 1st. The hoist on this mine is new and novel. The machinery is from the shops of Knight & Co. Instead of the old system of setting the water-wheel on a separate shaft and then belting to the hoist, Mr. Knight here placed two of his nine-foot wheels directly on to the shaft that carries the cable reels. The wheels are set so as to reverse the motion, and, to date, the machinery has been found to give entire satisfaction. Messrs. Valentine took hold of the mine when she was about abandoned, cleaned out the old shaft, and put the mine in its present shape. Everything indicates that under their management tbe mine will prove to be a very valuable property.

The Lincoln is idle, but will, when handled like the Hector, prove its value.

THE BELMONT, J. H. Tibbits, superintendent, has now a fine shaft down 220 feet. The vein is here eight feet in width. The mill of ten stamps will be started as soon as drifts and upraise are completed, and a good hoist will follow. Mr. Tibbits is proceeding slowly with his work, making sure of his footing as he proceeds; and though apparently slow, in the end it will be satisfactory.

REDUCTION WORKS.—Midway between Sutter Creek and Amador City is situated the Amador Reduction Works of Messrs. Voorhies & Barney, who are also the proprietors of the Phœnix Reduction Works at Drytown. The first-named plant is one of the most complete in the State, and is under the charge of Senator Voorhies. This has a capacity of 4½ tons of sulphurets a day. The works treat a large quantity of sulphurets, working them up to a very high percentage. The Phœnix plant is in charge of Mr. Barney. While this plant is not as large as those of Senator Voorhies, the work done here is equal to that of the other works. To these works is due in no small measure the financial success attending mining in this county.

THE WABASH.—This property, at Amador City, is north of the Belmont and south of the South Spring Hill. A crosscut tunnel has recently been run on this mine and a very fine vein of gold-hearing quartz encountered. Its situation is such that it is safe to predict that when developed it will prove to be a valuable property.

SOUTH SPRING HILL.—The shaft is now down 900 feet and the mine very thoroughly developed to this depth. The 40 stamp mill is pounding away regularly, while the Frue, Triumph and Woodbury concentrators sit side by side elbowing each other in trial for the supremacy. J. R. Tregloan is superintendent of the mine.

THE KEYSTONE.—The old Keystone, E. T. Hale superintendent, has held the arch with a production of over $7,000,000, and Mr. Hale is delving away in the old workings for neglected or hidden treasures, keeping 25 of the 40 stamps dropping. Mr. Hale has put in modern concentrators and left nothing undone to lessen the expense and increase the income of the mine. On the Keystone is to be found a mining timber framing machine, the patent of Mr. Isaac Lepley, which, if it were but known, would be generally adopted wherever there is a large amount of timbers to be framed. The timber is fastened on to a car which is brought forward by a lever. The framing machinery, which is a cutter head, is then brought up one side of the timber, over the top, down the otber side, and back under the bottom, thus framing all four sides of the end at one time, and that in less time than I can describe it. The machine has been in operation on this mine for a number of years, and is also used on the Zeile and at a mine at Bodie. It will well repay any mining operator to inspect the machine, as the framing of one timber will suffice to convince the most skeptical that Lepley's mine timber framer is as great an advance over hand framing as the power drill is over the hand drill.

QUARTZ MOUNTAIN.—The mines of this section are located about 1¾ miles east of Amador City and the mother lode. The quartz crops very strongly all along the summit of the ridge, hence the name. The mining thus far has been principally by short open cuts and tunnels in the grass roots. The vein there is from 5 to 15 feet in width, of a ribbon character, with a very small per centage of galena. In this surface rock the percentage of sulphurets will run from nothing to 10 per cent, with a small average. This, however, is counterbalanced hy the high value of the sulphurets, which assay from $400 to $1800 a ton. If a shaft were put down on this vein to 500 feet, there is everything to show that the vein would prove very valuable below water level. Tbe vein is of that character that would increase its free gold and sulphuret values tenfold, once the vein was opened to live rock. The present free gold value of $1.25 would no doubt increase to $10, while the percentage of sulphurets, wbich is now less than one per cent, would increase to at least 2½ per cent. The principal operations on the vein are located on the ground of the Gold Mountain M. Co.

THE GOLD MOUNTAIN.—On this location a series of open cuts have been run near the surface and a vein opened which runs from 5 to 25 feet in width. In some of the openings the vein has broken over and lays flat, thus giving it the appearance of being very wide. The rock carries bunches or streaks of quartz which are very heavily mineralized. The quartz is fine, dry and granular, with a ribbon structure. From these surface works the rock is hauled down the hill to a mill hy tramway about 1200 feet long. At the mill 20 stamps are erected. Two of the batteries are of the all-iron patent of the Pacific Iron Works. These are open at both sides and hoth ends, only closed at the corners. This style of battery allows the pulp to escape as fast as crushed; which prevents the galena from sliming and increases the battery's output to 50 per cent more than the adjoining single discharge battery. After leaving the battery tbe ore is fed on to six-foot Frue and seven-belt Woodbury concentrators, two to each battery. Below the batteries there is arranged a blanket and tank system to catch the fine mineral that may escape from the concentrators. The mill will undoubtedly do good work on this class of ore and once the mine has a shaft put down on the vein 500 feet and a direct automatic tramway from the shaft down in a direct line to the mill, the property will come to the front as one of the best in the county.

Adjoining this mine are a number of other locations which promise equally well. On one of them, the Goodwin, Mr. W. G. Whorf has driven a crosscut tunnel and showed up a good vein, but the mine is tied up in litiga-

tion. Given depth, this is a good vein, but I doubt if the present surface workings can be made to pay expenses. Amador county's mines have never got into bonanza until about 1000 feet deep, and that is what this vein wants—depth.

The old Bunker Hill has closed down. The superintendent was out of town, and, in consequence, I could learn nothing reliable as to its possible future.

THE GOVER.—A. B. Call is superintendent of the Gover which is about an equal distance from Amador City and Drytown, and is the only mine in operation in that section. The mine is now opened 1140 feet, or 140 feet below the old workings. The width of the vein in the old workings is 15 feet, of fair-grade ore that carries, in addition to its gold values, about 3½ per cent sulphurets of an assay value of $109 a ton. The top of the shaft has been remodeled and self-dumping skips put in. The most interesting feature of the mine is its electric-pumping plant, which throws a continuous stream of 12 inches of water which flows as regularly as though it were a babbling brook. The mill is of 20 stamps. An extensive system of blankets and sluices extends beyond the mill, which, with the settling tanks, allows very little to escape.

PLYMOUTH.—Old Plymouth is dead. The New London plant has been removed to the Raw Hide mine, Tuolumne county. The old Empire and Plymouth mines lie idle—a relic of bygone days. At the time of the fire in January, 1888, the Plymouth was paying a regular monthly dividend of $15,000. The fire closed the mine for eight months. The mine was opened in 1889 and the water had risen and put the fire out. The mine was reopened into the old ground and worked to a profit for eight months, when the mine caved, leaving possibly a year's supply of good quartz in these old stopes. After the cave the mine was opened south and the ore bodies encountered worked out, and the old mine closed down for good August 1, 1892. During the life of the mine the property paid dividends of over $4,000,000. As the mine did not pay above the 1000-foot level, and everything went for expenses, it is very safe to say that the total output of the mine exceeded $10,000,000.

THE BAY STATE.—W. T. Jones is president and general manager of this mine. The Bay State is on the southwest bank of Indian creek, near its junction with the Cosumnes river, three and one-half miles north of Plymouth, and is on the mother lode. The mine was first located by a miner named Philips; then sold to Maguire; then to Poundstone; and then secured by Mr. Jones, who organized a local company to develop the property under the title of the Bay State Mining and Developing Co. A shaft was started 40 feet back of the vein in the foot wall, and sunk on the pitch of the vein 300 feet. A crosscut was run 25 feet to the channel of the vein which was crosscut and at 124 feet the contact on hanging wall was struck. A drift was then started and run south 50 feet on the foot wall; here a stringer of quartz three inches wide came in, which is gradually increasing, until at 100 feet from the crosscut it has widened out to five feet of a very fine ribbon quartz which samples $8 a ton, and at the time of my visit was showing very nicely in visible gold with the vein rapidly increasing in width. A drift was run north on the foot wall and at 25 feet ribbon quartz came in, about three inches wide, and was run on for 45 feet, when the quartz had increased to three feet in width. The quartz is the same in character and appearance as in the south drift and samples $6 a ton. As this is only 300 feet deep, the owners feel that once they get down below the 1000-foot level they will have a mine in size and value equal to the old Plymouth. Mr. Jones will continue on out on the present drifts until there is sufficient quartz in sight to feed a mill, when it will be erected and the shaft continued on down. The mine owners are fortunate in the position of the property, as a fall of 325 feet can be secured, for pressure and water can be secured from the Plymouth ditch. It would look as though now it would be but a question of development to make the Bay State one of the best mines in the county, and the writer sincerely hopes that the good people of Plymouth who have invested their little private store of wealth in prospecting the Bay State may see their fondest dreams realized and Bay State stock command $10 a share. E. H. SCHAEFFLE.

Local Labor Unions.

THE different unions of the city are making preparations for their annual Labor Day parade, September 5th.

THE Horseshoers' Union reports that nearly all the bosses are now employing only union men in the shops. There are only two or three small concerns which employ nonunion men.

THE Granite-cutters' Union has installed the following named as officers: M. Becklay, president; M. Mondt, vice-president; Alexander G. Craig, secretary; W. Thomas, financial secretary; W. Donald, treasurer.

THE new organization known as Wiremen's Union, No. 1, composed of the electric-wire layers of this city, met at Drew's hall on New Montgomery street, Monday night, to adopt by-laws and perfect arrangements for permanent organization.

THE Cigar-makers' Union reported to the Council of Federated Trades that trade is very dull and many men are idle in consequence. All union men are requested to buy only white-labor cigars and leave cards requesting the cigar-dealers to sell only that class of goods at each store.

AT the last meeting of the council of Federated Trades, the Coopers' Union reported that the bosses had refused to submit their differences to arbitration. They reported that 110 union men are out of work and that if the trouble is not settled at an early date a cooperative factory will be started.

THE Pavers' Union of this city is in a prosperous condition, and all its members are at work. The new officers are as follows: President, Daniel Dismond; vice-president, Edward Lyons; financial secretary, John Callon; corresponding secretary, M. McMurphy; treasurer, James Flinn, and sergeant-at-arms, Thomas McGrath.

The Cyanide Process.

A Chemical View of It.

SAN FRANCISCO, Aug. 13, 1892.

TO THE EDITOR:—Having read all the literature accessible relating to this new process for extracting gold and silver from refractory ores, and having studied carefully its chemistry and electrical relations in metallurgy, the writer offers some suggestions which will, perhaps, help those interested to understand some of its peculiar features which are most puzzling.

It is claimed by MacArthur that cyanide of potassium dissolves out the gold and silver from base ores *by preference*, leaving the base metals untouched and the appearance of the ore unchanged to the eye. This action, being the opposite of chlorine and other solvents, may be explained by investigating the electro-chemical relations existing between the different metals and their solvents.

All substances bear certain electrical, or magnetic, relations to each other, that is, each one is positive or negative to all others, in a definite degree, and they are so classed by scientific authorities. For instance, the leading elements, as classed by Gore, a high authority, are electro positive or negative in the following order, beginning with the most positive and ending with the most negative, viz.: Potassium, sodium, magnesium, zinc, iron, aluminium, lead, tin, bismuth, copper, silver, mercury, platinum, gold, hydrogen, antimony, carbon, tellurium, phosphorous, selenium, iodine, bromine, chlorine, nitrogen, sulphur, fluorine, oxygen. As a rule, the farther any two of these are apart in the scale, the stronger is the affinity between them, and each is negative to all before it and positive to all following it, in proportion to the distance they are apart.

Cyanide of potassium is composed of two negatives—nitrogen and carbon—together forming cyanogen, which, acting chemically as a radicle, or element, unites with potassium, the positive element of the scale, and forms a solvent in which the positive element predominates. Cyanogen cannot exist permanently by itself and requires potassium, or some other highly positive element, to *fix* or hold it. It is the cyanogen which attacks and dissolves the gold and silver in the ore, but the potassium causes it to seek out the most negative metals and unite with them by preference, because of the stronger affinity of the positive solution for that class. Looking again at the scale above given, gold is the most negative metal and silver next; therefore, the gold and silver are first dissolved by the cyanogen and taken into the combination, forming a double, or triple, cyanide of gold, silver and potassium. Unlike other solvents, cyanide of potassium is not decomposed (but slightly), that is, the gold and silver unite with the cyanogen without displacing the potassium. The latter, probably, takes up a little oxygen and causes a slight waste, or weakening of the solution.

It is proper to state that different solutions change the relative positions, in the above scale, of some of the principal metals. In a cyanide, chloride and some other solutions, gold and silver are negative to antimony, which, in the scale given, is the reverse. So in a strong (12 per cent) cyanide solution, copper, lead and antimony are positive to iron. Here, again, it must be noted that, while cyanogen attacks the most negative metals first, by preference, it does not follow that it will not attack the others also. On the contrary, it will follow up its attacks upon the others in succession, according to their negativeness—that is, if there is enough cyanogen to go around and supply the demands of all. This explains an important feature of the cyanide process, namely, that the solution must be *very weak*, so that there will only be cyanogen enough to dissolve the two metals you wish to capture and not disturb the others. There can be little doubt that some of the failures in trying the process result from using the cyanide too freely.

Other solvents of the precious metals commonly employed, such as chlorine and the acids, attack the more positive or base metals first, all of which have to be supplied with some substance more attractive before they will give up their hold upon their associates in the original or natural combinations existing in the various ores. These common solvents are negative in character, and hence prefer to unite with positive substances. Cyanogen associated with potassium is of a positive character and prefers negatives. These facts suggest that in some kinds of ores, both positive and negative solutions may be advantageously employed, one at a time, to dissolve out the different metals sought for.

Another peculiar feature claimed for the process, as of great economic importance, is that the ore yields almost as high a per cent of gold and silver when crushed very coarsely as when reduced to ordinary fineness for amalgamation. This means that the same power that crushes two tons a day per stamp, using a 30-mesh screen, will crush about three tons a day using a 20-mesh screen, thereby increasing the output 50 per cent. That the percentage of fine assay value is practically the same in leaching the ores of different fineness with the cyanide solution, or any other for that matter, is fully established by long experience with the Russell process, where hyposulphite of soda is used as a solvent. The solution penetrates the coarse particles of sulphurets and reaches the metal sought for, just as the acid employed by the assayer to extract the silver from a button containing both gold and silver penetrates the metal of the flattened button, dissolves out the silver and leaves the gold untouched.

Considering the foregoing facts, and that no concentration, no roasting nor expensive amalgamating machinery is required, the cyanide process certainly has a future before it.

The contamination of the bullion with the zinc used to precipitate the gold and silver from the solution, is unfortunate, but will soon be overcome by the introduction of a better precipitating agent, in due time, by the writer.

M. T.

Care of Tools.

The wooden parts of tools, such as the stocks of planes and handles of chisels, are often made to have a nice appearance by French polishing, but this adds nothing to their durability. A much better plan is to let them soak in linseed oil for a week, and rub them with a cloth for a few minutes every day for a week or two. This produces a beautiful surface, and at the same time exerts a solidifying and preserving action on the wood.

The following recipes complied by *The Tradesman*, are recommended for preventing rust on iron and steel surfaces.

1. Caoutchouc oil is said to have proved efficient in preventing rust, and to have been adopted by the German army. It only requires to be spread with a piece of flannel in a very thin layer over the metallic surface, and allowed to dry up. Such a coating will afford security against all atmospheric influences, and will not show any cracks under the microscope after a year's standing. To remove it the article bas simply to be treated with caoutchouc oil again and washed again after 12 to 24 hours.

2. A solution of indianrubber in benzine has been used for years as a coating for steel, iron and lead, and has been found a simple means of keeping them from oxidizing. It can be easily applied with a brush, and is easily rubbed off. It should be made about the consistency of cream.

3. All steel articles can be perfectly preserved from rust by putting a lump of freshly burnt lime in the drawer or case in which they are kept. If the things are to be moved—as a gun in its case, for instance—put the lime in a muslin bag. This is especially valuable for specimens of iron when fractured, for in a moderately dry place the lime will not want renewing for many years, as it is capable of absorbing a large amount of moisture. Articles in use should be placed in a box nearly filled with thoroughly slacked lime. Before using them rub well with a woolen cloth.

The following mixture forms an excellent brown coating for preventing iron and steel from rust: Dissolve two parts crystallized iron chloride, two antimony chloride, and one tannin in four of water, and apply with sponge or rag and let dry. Then another coat of paint is applied, and again another if necessary, until the color becomes dark as desired. When dry it is washed with water, allowed to dry again, and the surface polished with boiled linseed oil. The antimony chloride must be as nearly neutral as possible.

5. To keep tools from rusting, take half an ounce of camphor, dissolve in one pound melted lard; take off the scum, and mix in as much fine black lead (graphite) as will give it an iron color. Clean the tools and smear with this mixture. After 24 hours rub clean with a soft linen cloth. The tools will keep clean for months under ordinary circumstances.

6. Put one quart freshly slacked lime, half pound of washing soda, half pound of soft soap in a bucket and sufficient water to cover the articles; put on the tools as soon as possible after use, and wipe them up next morning, or let them remain until wanted.

7. Soft soap, with half its weight in pearlash, one ounce of mixture in about one gallon boiling water, is in every day use in most engineer's shops in the drip-cans used for turning long articles brought in wrought iron and steel. The work, though constantly moist, does not rust, and bright nuts are immersed in it for days until wanted, and retain their polish.

8. Mix slowly together six ounces or eight ounces lard to one ounce resin, stirring till cool; when it is semi-fluid it is ready for use. If too thick it may be further let down by coal oil or benzine. Rubbed on bright surfaces ever so thinly, it preserves the polish effectually, and may be readily rubbed off.

9. To protect metal from oxidation, polished iron or steel, for instance, the requisite is to exclude air and moisture from the actual metallic surface; therefore, polished tools are usually kept in wrappings of oil cloth and brown paper, and thus protected they will preserve a spotless face for an unlimited time. When these metals come to be of necessity exposed in being converted to use, it is necessary to protect them by means of some permanent dressing, and boiled linseed, which proves a lasting covering, as it dries on, is one of the best preservatives, if not the best. But in order to give it body it should be thickened by the addition of some pigment, and the very best, because the most congenial of pigments is the ground oxide of the same metal, or, in plain words, rusted iron, reduced to an impalpable powder, for the dressing of iron and steel, which thus forms the pigment or oxide paint.

10. Slack a piece of quicklime with just enough water to cause it to crumble in a covered pot, and while hot add tallow to it and work into paste, and use this to cover over bright work. It can be easily wiped off.

11. Olmstead's varnish is made by melting two ounces resin in one pound fresh, sweet lard, melting the resin first, and then adding the lard and mixing thoroughly. This is applied to the metal, which should be warm, if possible, and perfectly cleaned; it is afterward rubbed off. This has been well proved and tested for many years, and is particularly well suited for planished and Russian iron surfaces, which a slight rust is apt to injure very seriously.

RUST REMOVERS.

1. Cover the metal with sweet oil, well rubbed in, and allow to stand for 48 hours; smear with oil applied freely with a feather or piece of cotton wool after rubbing the steel. Then rub with unslacked lime reduced to as fine a powder as possible.

2. Immerse the article to be cleaned for a few minutes, until all the dirt and rust is taken off, in a strong solution of potassium cyanide, say about one-half ounce in a wine glassful of water; take it out and clean it with a tooth-brush with some paste composed of potassium cyanide, castile soap, whiting and water mixed into a paste of about a consistency of thick cream.

Practical Suggestions to Young Woodworkers.

Since the care and management of wood-working machinery has become recognized as a trade, the young man who intends to adopt this as his business should look upon it in the same light as any other trade or profession, and make up his mind to become, as far as possible, familiar with all the machinery that belongs to this class, so that he may be able to successfully manage any machine that may come into his hands. The time has gone by when it was considered that any intelligent man or boy could in a few days or weeks make himself sufficiently familiar with a planing machine or a molding machine to make it a success. It is true that many such men, after stumbling along for a few months, and spoiling any amount of good lumber, with probably several breakdowns, have at length become passable operators; while others have succeeded in losing a few fingers or perhaps a hand, and abandoned the business in disgust.

But at the present time, with the increased value of lumber and the more complicated and expensive machinery, the proprietors of planing mills and other wood-working establishments find it to their advantage to employ none but competent and experienced men to take charge of and manage the machinery of an ordinary mill.

The time was when the fact of a man being a carpenter or other wood-workman was a sufficient recommendation to warrant him in applying for a situation as a planing mill foreman; and while his previous knowledge of carpenter or joiner work might be of some advantage to him in judging of the quality of the work performed by the machine, yet without a practical knowledge of the use of machinery, his previous knowledge, so far as keeping it in a proper condition to turn out the work, was of but little consequence, and he might as well have been a mason or a machinist.

It is not necessary that a man who learns the business of a woodworker should he a carpenter or a cabinet maker. The term woodworker is only applicable to those whose business is to work wood by the use of machinery. There is a wide difference between a wood-workman and a woodworker. A wood-workman is one whose business is working in wood principally by the use of hand tools, and he may be a joiner, a pattern maker or a piano maker; and while each one is a wood-workman, yet a joiner may not understand the first principles of pattern-making, nor the pattern maker the first principles of piano-making. But with a competent woodworker, one who thoroughly understands the care, management and use of wood-working machinery, it matters little to him whether he is employed in the planing mill, sash and door factory or a furniture factory; the principal machines are common to each, and if he can run a planing machine or a molding machine successfully in one place, he can, with equal success, run the same machines in another. All he requires is patterns or drawings to work to. Therefore, in order to become a good, practical woodworker, it requires as much mechanical skill and ability as any one of the mechanic arts.

It is a fact that is well known to all planingmill proprietors, as well as proprietors of other wood-working establishments, that first-class men who are capable of taking charge of and managing successfully the machinery of a mill are not plenty, and the few, comparatively, who are such, command large salaries. This arises from the fact that but few young men at the present time are willing to spend the necessary time in serving a regular apprenticeship and working for apprentice's wages. The fact is, a young man who goes to work in a planingmill, for instance, is not willing to work but a few months before he wants the same wages as the other workmen; and that being the case, the proprietor or his foreman must necessarily put him upon such work as will enable him to earn it, and the consequence is, he learns but little about the business. Or if he is put upon some machine and given a certain class of work, he may learn this one thing; but so far as the general practical knowledge of wood-working and other machinery of the mill is concerned, he is no better off than if he had worked in a shop where there was no machinery at all.

Again, if he should leave this mill and go to another, unless he was lucky enough to find the same work and the same kind of machine, he would be little better than a green hand.

If a young man intends to become a woodworker, and make that the future business of his life, and become competent to take charge of a mill should a situation of that kind offer itself, he must expect to serve an apprenticeship in the same manner as he would if he were to learn the trade of a patternmaker or a machinist; and certainly no young man would expect to obtain journeyman's wages while he was learning either of those trades, or of completing his apprenticeship in a few months. The first and one of the most important branches of wood-working is to became a good sawyer. This not only consists in being able to cut up lumber economically and to the best advantage, but also in keeping the saws, as well as everything else pertaining to the machine, in perfect running order. A good sawyer may always be known by his saws. The teeth will be kept in proper shape, and few if any "beauty spots" will be found upon their sides. The planer should be the next machine to learn the use of; not only in being able to feed the stuff to it correctly, for that part can he learned by any intelligent laborer in a few days, but in fitting up the necessary tools, adjusting the several parts so as to obtain the best results, the care of the belts and boxes, and, in fact, everything pertaining to the machine that is required to keep it in first-class running order. All this, of course, will be done under the direction of a careful and competent foreman, and what is applicable to the planer is equally so with all other machines.

Right here I will say, although it has been often stated that planingmill foremen are averse to showing or teaching young men these points, yet in my extensive acquaintance with planing-mill foremen in all parts of the country I have never yet found a case where an intelligent and competent foreman has refused to impart all the necessary information to an apprentice who was faithful to his employers and anxious to learn. And those complaints generally come from a class of young men who expect to learn the whole business and obtain journeyman's wages in a month or two, and at the end of that time or before know more than the foreman, who has had perhaps 20 years experience, and yet is still able to learn something every day.

It is no wonder that the foreman sometimes loses his patience with such men. But whose fault is it?—G. R. Tompkins, in the Lumber Worker,

The Rose Mine, Morongo District.

Last Friday morning a Riverside *Press* representative, in company with G. A. Fudickar and J. W. Roberts, started from Bear valley for a visit to the Rose mine, in the Morongo district. The distance is 20 miles, over a very good mountain road. Reaching the mine we were most cordially received by D. A. Wheeler, superintendent, and family, and W. B. Taylor, assayer and mill manager, who showed us all over the mine and mill and explained everything to us. They were all feeling very jubilant and happy, for that very day the miners had struck a wider and richer body of ore than any previous ones. We went down in the mine, and on the 115-foot level, about 200 feet from the main shaft, examined this rich ledge, which was on that day nine feet wide and growing larger the farther they went. The main shaft, which is at an incline of 35 degrees, is down 200 feet. At that depth a level is to be run to strike the ledge of rich ore found above. A large amount of development work has been done, levels run in various directions and shafts sunk, for when they got down 50 feet they lost all trace of the ledge, and for 65 feet farther worked in barren rock. Things looked blue at the Rose mine at that time, and but for the faith and determination of Mr. Wheeler, no doubt work would have ceased and the Riverside owners been out of pocket many thousands of dollars. But Mr. Wheeler kept on, overcoming many obstacles, and at last struck the ledge again. Now there is no question about the richness and large amount of ore in the mine. The ore, which is a dark red in color, is now being taken out much faster than the mill can crush, and five more stamps are to be added.

At present the mill is turning out about $150 a day, 12 hours' run, and it costs about $60 a day to operate the mine and mill. So it will be seen that there is a good margin of profit, even if only about 50 per cent of the gold is saved. Only free gold is now extracted, and about half goes off in the tailings. These tailings, of which there are 1000 tons on the dump, will be run through a concentrator—which is probably in operation by this time—and then the concentrates will either be treated by the cyanide process or sent to a smelter. Nearly all the gold will thus be extracted, doubling the output.

The mill, orehouse, whimhouse, and other buildings are large and convenient and the machinery the very best.

The mill has now five stamps, but is made for ten, and the other five will be put in soon. A concentrator was being put up while were there. Fuel is abundant, as the hills are covered with pine, cedar and oak.

The company has had some trouble about water, as the supply has been limited. But Mr. Wheeler has been developing more lately, and an adequate supply is assured. It is brought in a two-inch pipe across the hills, a distance of two and a half miles, and carried to a couple of large tanks above the mill.

There is a good boarding house where substantial meals are served; quite a number of cabins and tents are scattered around, making a lively little settlement, way off near the edge of the desert.

This mine, owned entirely by Riverside parties, has developed into a rich and well-paying property, and Mr. Wheeler deserves great credit for his perseverance and intelligent labors in the face of obstacles that would have daunted most men. But he was confident the ore was there and he was bound to find it.

The owners of the Rose mine are fortunate in having such a capable and energetic superintendent as Mr. Wheeler, who is also the largest stockholder, and therefore deeply interested in the success of the mine on several accounts. The manager of the mill, W. B. Taylor, has had large experience in running mills in Colorado and New Mexico, and thoroughly understands the business. The foreman of the mine, Mr. Hooper, is an old, experienced miner.

The Morongo district is very promising, and the late strikes in the Rose will draw many to that section. While there Mr. Fudickar purchased a half interest in the "Seneca," a silver mine near the Rose, the ore of which assays from $60 to $100 in silver and $10 in gold.

On our way back we stopped at an onyx mine, owned and worked by B. H. Wright. He has three magnificent ledges of onyx, two being black and one white, each ten feet wide. Some polished specimens shown us were fully equal to the Mexican product so highly prized. Mr. Wright has disposed of some of this beautiful stone at $3 50 per cubic foot at the mine.

That whole country is full of mineral, and no doubt some very rich mines will be discovered from time to time.

DR. C. J. EAMES still maintains that he will locate his "squeezer bloom" iron plant at Roseville, San Diego county, and not in Ventura as reported. As is known, a large proportion of the machinery is already on the ground, including the big squeezer sent from Pittsburg. One furnace is completed at Roseville and two others are well along. The squeezer, however, was nipped in the bud, before it had opportunity to bloom, during the recent cold spell, when attachments and executions fell like a white frost on the whole Roseville iron plant. But the plant was not carried away or dug up, and only requires irrigation and liquidation to set it going.

Ocean Beach Mining on Monterey Bay.

"We have made a practical test of ocean beach mining,' said Dr. F. R. Waggoner to a Sacramento *News* reporter, "and it has proven a much greater success than the most sanguine of our company anticipated."

"What process are you employing in your mining?" I asked.

"The Ball-Norton electro-magnetic separator," replied the Doctor. "Our company is a regularly organized mining company, with president and treasurer, and is called the 'Pajaro Mining Company.' We own about a mile and a half square of ground on the line of the railroad between Santa Cruz and Watsonville, and about a mile from the bay of Monterey. Our mine is magnetic iron ore and gold deposited by the action of the waves in prehistoric years. It is the most remarkable deposit of iron ore in that form on the Pacific coast, and is the only one of the kind known. The Pajaro mining company, of which I am president, has put in a plant for working this ore, or, as it is commonly called, black sand. This plant consists of an electro-magnetic separator, with which we are separating the particles of magnetic iron from the silica and other nonmagnetic matter. Our working test has shown that we can, with this machine, separate the magnetic iron from all other matter up to as high as 72 per cent of chemically pure iron. In the residue, or tailings, if you want to use a mining term, is fine gold which, treated by the wet process of amalgamation, by running through sluices and over plates in a revolving quicksilver pan, returns from $10 to $15 per ton. The separator we now have in operation works 300 tons in 24 hours, 65 per cent of which is magnetic iron and the residue nonmagnetic matter, such as silica and other product in which are the particles of gold.

"Ocean beach black sand has been worked on this coast since the very earliest days of the discovery of gold here. In some instances, miners have made from $2 to $3 a day by sluicing with blankets and burlaps for catching the gold, and sometimes rockers yielded to the industrious worker a fair living. The hot-lead amalgamation process, even, was tried, but it proved a dismal failure. The process was to force the sand into molten lead, expecting that the lead would take up the gold like quicksilver. The effect, however, was that the lead oxidized and volatilized and became litharge, when it fell in imperceptible particles over the surrounding country. Many other processes of amalgamation were abandoned because the magnetic iron in which gold was found 'sickened' the quicksilver and it would not take up the particles of gold. I have been experimenting for the past ten years with various processes, and found them all impracticable. Finally, I dropped on the electro-magnetic separator and it has proven a success. It simply separates by the aid of a powerful magnet. Two drums, composed of wood or paper, with positive and negative magnets turning upon shafts, and with apertures in the drum for the entrance and exit of the ore, are the main parts of the machines. I could explain its construction technically and at length, but it would require cuts and diagrams to properly describe the machine.

"The deposit where we have set up our plant is about 100 feet below the surface and is five feet thick. On top of it is a seamless sandstone nearly 20 feet thick. Above this sandstone is a gray sand extending to the surface. Of course, the question presents itself; how did this immense deposit of magnetic sand containing gold get there? I think it was washed there in prehistoric ages, by action of the ocean's waves. Since then the shore upon which it was deposited has gradually risen, until now it is many feet above the ebb and flow of the tide. Even now the same process of depositing magnetic sand is going on all along the coast, but in a much slower degree than in the earlier ages. Close down to the water's edge may be seen strata of sand, recently deposited, which are six or eight inches thick. Yet in no place around the coast have I seen the strata so thick as around the bay or Monterey. Where the Pajaro mine is situated the bay is formed in such a peculiar shape, however, that the waves have had a splendid opportunity to concentrate their power and dash upon the shore more of the sand from the sea than probably at any other point along the entire coast. The valuable properties of this magnetic iron, however, are the great demand for it in the iron markets of the world. From it is made the best quality of steel. It is free from sulphur and phosphorous and commands $6.50 a ton in the East. As we are at tide water, it can be shipped by sail to Eastern markets at a profit. The cost of mining and separating does not exceed 25 cents a ton, and the supply is practically inexhaustible. Then the gold which will be taken from what we denominate the 'tailings" is an item that must not be overlooked. I think it is the best mining proposition I have seen in California since the days of '49, and the balance of the stockholders think so, too. There are 4000 shares in the company."

THE Gem Marble Company, through C. R. Merriam, has made an application to the Board of Trade, asking that body to assist in raising a bonus of $10,000 to enable the company to locate its works in Oakland. As that city already has a job on its hands collecting a bonus for the Fulton Iron Works, perhaps some other town can accommodate the Gem Marble Co.

A MOVEMENT is on foot, says the San Diego *Sun*, to manufacture water pipes out of redwood strip four inches wide with asphalt in the seams and patent wooden bands holding them immovable. These will be much cheaper than metallic pipes, and will revolutionize things in the arid land region of San Diego county.

MESSRS. MCINTOSH & SHEA have commenced to open up the Industrial mine at Glencoe, Calaveras county. They contemplate putting up a 30-stamp mill as soon as the shaft is cleaned out.

ROSE'S
MECHANICAL DRAWING SELF-TAUGHT.

Fourth Edition, Thoroughly Revised and Corrected.

Mechanical Drawing Self-Taught. Comprising Instructions in the Selection and Preparation of Drawing Instruments, Elementary Instruction in Practical Mechanical Drawing; together with examples in Simple Geometry and Elementary Mechanism, including Screw Threads, Gear Wheels, Mechanical Motions, Engines, and Boilers. By Joshua Rose, M. E. Illustrated by 330 engravings. Fourth edition, thoroughly revised and corrected. 8vo. 303 pages. Price.....$4.00

BY THE SAME AUTHOR.

Modern Steam Engines. An Elementary treatise upon the Steam Engine, written in plain language for use in the workshop as well as in the drawing office; giving full explanations of the construction of Modern Steam Engines, including diagrams showing their actual operation; together with complete but simple explanations of the operations of various kinds of valves, valve motions, link motions, etc., thereby enabling the ordinary engineer to clearly understand the principles involved in their construction and use, and to plot out their movements upon the drawing board. By Joshua Rose, M. E. Illustrated by 422 engravings. In one volume, quarto, 321 pages. Price.....$6.00

The Complete Practical Machinist. Embracing Lathe Work, Vise Work, Drill and Drilling, Taps and Dies, Hardening and Tempering, the Making and Use of Tools, Tool Grinding, Marking out Work, etc. By Joshua Rose, M. E. Illustrated by 356 engravings. Fifteenth edition thoroughly revised and in great part rewritten. 12mo, 439 pages. Price.....$2.50

The Slide Valve Practically Explained. Embracing Simple and Complete Practical Demonstrations of the Operation of each element in a Slide Valve Movement. By Joshua Rose, M. E. Illustrated by 35 engravings. 12mo. Price.....$1.00

Steam Boilers. A Practical Treatise on Boiler Construction and Examination. For the use of Practical Boiler Makers, Boiler Users and Inspectors; and embracing in plain figures all the calculations necessary in Designing and Classifying Steam Boilers. By Joshua Rose, M. E. Illustrated by 73 engravings. 8vo. 250 pages. Price.....$2.50

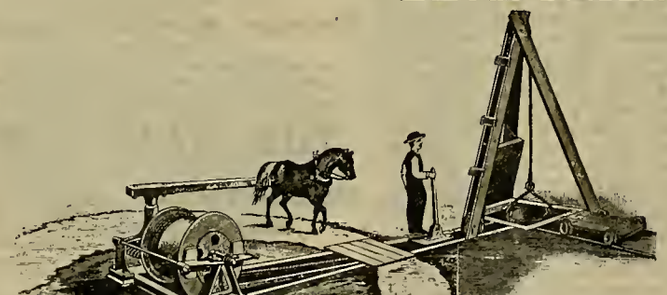
BUILDERS OF
"Sensible" Horse-Power Hoisting Whims.
(DAVIS PATENT.)



PRICES REDUCED.

The "Sensible" Hoist is the cheapest and beyond doubt the best in the market. It is built entirely of iron and steel, mounted on a heavy iron base plate, and is therefore very durable and not affected by exposure to climatic influences.

The bevel gear on the drum shaft is loose, and, in hoisting, drives the drum through a friction clutch. This avoids the frequent accidents occurring with other Whims, occasioned by the breaking of the gear teeth when throwing them out of gear. In lowering, the drum is pressed by a powerful screw lever against brake woods at the opposite end. Perfect means of adjustment are provided for the friction clutch and brake blocks.

As the drum is entirely independent from the driving gears the operations of hoisting, dumping bucket and lowering can be performed with the horse in constant motion, a feature not possessed by any other horse hoist in the market, and one that greatly increases the capacity of the machine by avoiding the loss of time due to stopping and starting the horse.

It is very light and compact and very easily taken to pieces for transportation by mules. The cost of erection is very small, two men in half a day being able to put it in place ready for work.

Weight of hoist, 1200 lbs. Total shipping weight, including sweep, levers and sheaves, 1400 lbs.

Circulars giving Capacities and Prices furnished on application.

BALDWIN LOCOMOTIVE WORKS.
ANNUAL CAPACITY 1000. ESTABLISHED 1831.
LOCOMOTIVE ENGINES!

Adapted to every variety of service, and built accurately to standard gauge and templates. Like parts of different engines of same class perfectly interchangeable.

Broad and Narrow Gauge Locomotives, Mine Locomotives by Steam or Compressed Air, Plantation Locomotives, Noiseless Motors for Street Railways, Furnace Locomotives, etc.

COMPOUND LOCOMOTIVES

BURNHAM, WILLIAMS & CO., Proprietors, Philadelphia, Pa.

RUPTURE,

MECHANICAL PROGRESS.

Foundry Mixtures.

At a recent meeting of the Foundrymens' Association of Philadelphia, Mr. J. M. Warner read a paper on the above subject, from which we make the following extracts :

A more limited knowledge of the chemistry of iron, coupled with a better acquaintance of its physical characteristics, has resulted in very important changes in foundry mixtures in the past five years. These changes have been more important and radical in the West than in the East. Most of the large agricultural machine manufacturers, jobbing foundries, architectural works, etc., which five years ago were using largely of Nos. 1 and 2 foundry, with high-priced softeners, are now making their entire mixture with No. 2 foundry, No. 3 foundry and grey forge, and a little low-grade high-silicon iron. The firm of Rogers, Brown & Co. about four years ago began an exhaustive series of experiments with foundry mixtures. The cooperation of leading smelters of iron throughout the central West was invited and freely accorded. Precise mixtures were given (in confidence, of course), and accompanying these were test-bars of uniform size. Something over 600 test-bars were thus broken, representing about 150 distinct mixtures. The data were very carefully noted and the results have formed the basis of foundry practice recommended by that firm. Some of the largest smelters of iron have readapted their mixtures with the advantage of securing a materially lower cost and a more uniform grade of castings. The old style of foundry practice, which was dependent upon No. 1 foundry for certain favorite brands, is practically a thing of the past, because the foundrymen retaining it cannot longer compete in prices in these days of fierce competition.

Noting in detail the results of some of these tests : The bars broken transversely were one inch square and 24 inches between supports. All tests were made under the supervision of a competent civil engineer. The strongest bar broke at 1923 pounds. It contained Southern coke iron, Ohio coke iron, scrap, and one per cent of ferro-aluminum; it was high mottled and too hard to work. The weakest broke at 840 pounds. It was made of a mixture of 50 per cent each of old car wheels and No. 1 Lake Superior iron, a brand of high standing. These two irons were melted together on account of admitted high strength of each in order to secure very strong castings for special work.

The strongest bar from a pig-iron mixture without ferro-aluminium was 1530 pounds. This was from an all-coke mixture in an Ohio agricultural shop in which only Southern and two Ohio brands and good scrap were used in equal proportions. The general average of all bars broken was 1120 pounds. In deflection, or bending capacity, the minimum was .53 inch, the breaking strength being 1445 pounds. The minimum was ¼ inch, the breaking strength being 845 pounds.

A careful study of the data gathered from these and other experiments by Rogers, Brown & Co. seems to show that red short irons (namely, those low in phosphorus and in silicon, such, for example, as strong all-Lake-ore iron) when mixed together, make castings weak, hard, and given to shrinkage and blow-holes. Cold short irons, or such as are high in phosphorus and silicon, when used alone, tend to weakness and hardness. The highest results are had when different varieties of these classes are mixed in proper proportions. These proportions should be such in ordinary foundry work that the resulting castings should run about 0.75 in phosphorus and pretty close to two per cent in silicon. The safest mixture is one in which the two elements of Lake Superior ores and Alabama ores combine in the highest proportions. In this combination, Nos. 2 and 3 grades may be used without making castings too hard. For example, for good machine castings, architectural work or general jobbing, a mixture of 30 per cent No. 2 foundry and 30 per cent No. 3 foundry standard Alabama iron with say 20 per cent strong Lake ore No. 2 foundry and 20 per cent scrap will give strength, smooth surface, hard lines, freedom from blow-holes and softness for ordinary machine work. If greater softness is required, ten per cent of silicon iron, either Southern or Ohio, will accomplish the result. If little finishing is needed, the proportion of No. 3 foundry should be increased. A mixture of this kind intelligently made as to brands, will give better results than would be had by the use of a strong No. 1 Northern coke iron with No. 1 imported Scotch as a softener.

Mill cinder, which is used to a greater or less extent in nearly all brands except those coming from the South, has a tendency to soften and fluidize the iron, but at the same time it renders it dirty and impairs strength. The use of good scrap where it can be obtained lower than No. 3 strong pig iron, after making proper allowance for difference between gross and net tons, the difference in weight, is always recommended. It multiplies indefinitely the elements in a mixture. It must, however, be bought with care and watched in using on account of irregularity.

A Device for Bending Piping and Bar Iron.

There is in the course of construction at Sheffield, England, a machine which, it is claimed, will bend iron piping and bars of any section, without kinking or flattening them. The bedplate may be attached to any improvised bench by means of four screws. On this bedplate is an upwardly projecting journal, in line with which is a slot, and in this slot may be adjusted at any distance from the center of the journal a stud or burr. A lever with a bifurcated end, in which are fitted a large and a small bending-wheel, both grooved so that when their perimeters are brought together they exactly fit the pipe or bar to be shaped, constitutes the moving part of the apparatus. These wheels are interchangeable for other wheels in bending different sizes of bars or pipes.

The large bending-wheel is passed over the upwardly projecting journal in the bedplate, this journal not only passing through the wheel, but through the bifurcated end of the lever. The smaller wheel is journaled through these counter parts by a pin, which is adjustable to different distances when the large wheel is interchanged. When the lever is turned around so as to abut against the stud or burr, the pipe or bar to be shaped is passed through between the two wheels, and the lever being then turned to a position at right angles with that which it occupied when the pipe or bar was inserted, a right angle bend will be formed. It is stated that the operation of bending requires but a moment, and that the pipe so bent is as smooth as any on the market. By the use of this machine, piping may be also bent in opposite directions, thereby saving fittings in making offsets.

MANAGEMENT OF BELTS.—We watched an engine tender the other day at work on a belt, which showed above all things that he didn't understand the why and wherefore of belts and belting. Some one at one time or another had put in a short piece of rubber belting to lengthen out with, and while the leather part was all right the rubber part gave out and broke at the lace holes. What did he do? asks the Boston *Journal of Commerce*. What he had done before, cut off the ragged edge and laced it up once more, never thinking that each time the belt was shortened the tension upon it when laced increased. Every time he put the belt on it broke in less than a minute, until we suggested a new piece of leather in place of the rubber, and proposed a piece longer than the rubber was originally. "That wouldn't do; it would be too loose." But it did do, and when the load is on, that belt is as slack as it should be on the slack side. This reminds us of another case where we ran across a man lacing a belt and after every effort it broke. It looked like a hopeless task to get that to hold, when at last it went off all right. We had concluded there would be another break, so had some curiosity to see why it did not this time. It appeared that the engineer had failed to secure the lacing when he finished, so the lacing pulled out several holes before it caught and thus lengthened the remainder to fit, practically lengthening out the belt three or four inches. The tension was enough to drive the load, but not enough so as to break the belt. It does not do to have a belt too tight. It ruins the belt and there is a big friction loss also. —Mechanical News.

ELECTRICAL ATTACHMENT FOR ELEVATORS.—The frequency of elevator accidents, due to the doors having been left open, has led an ingenious New York man to devise an electrical apparatus by which it is impossible for the elevator to move until all the entrances to the shaft are closed Each door is connected by a closed circuit with a pair of magnets controlling a lever which, in case a door is open and the circuit thus broken, will come in contact with projections on the starting wheel, thus preventing the operation of the machinery. Not until the door is closed, making the circuit complete again, will the lever be withdrawn from the projections and allow of any movement of the starting gear.

PACIFIC ROLLING MILL CO.,
.....MANUFACTURERS OF.....
Cast Steel Castings and Steel Forgings
UP TO 20,000 LBS. WEIGHT.
True to pattern and superior in strength, toughness and durability to Cast or Wrought Iron in any position or for any service.
GEARINGS, SHOES, DIES, CAMS, TAPPETS, PISTON-HEADS, RAILROAD and MACHINERY CASTINGS of Every Description.
— ALSO —
HOMOGENEOUS STEEL, SOFT and DUCTILE, SUPERIOR TO IRON FOR LOCOMOTIVE AND MARINE FORGINGS.
ALSO Steel Rods, from ¼ to 8 inch diameter and Flats from 1 to 8 inch. Angles, Tees, Channels and other shape Steel Wagon, Buggy, and Truck Tires, Plow Steel; Machinery and Special Shape Steel to size and lengths STEEL RAILS from 12 to 45 pounds per yard. ALSO, Railroad and Merchant Iron, Rolled Beams, Angle, Channel, and T Iron, Bridge and Machine Bolts, Lag Screws, Nuts, Washers, Ship and Boat Spikes; Steamboat Shafts, Cranks, Pistons, Connecting Rods, etc. Car and Locomotive Axles and Frames, and Iron Forgings of all kinds, Iron and Steel Bridge and Roof Work a Specialty.
HIGHEST PRICE PAID FOR SCRAP IRON AND STEEL.

FRUE ORE CONCENTRATOR

OVER 3200 IN ACTUAL USE.

Manufactured under Patents of April 27, 1880; September 18, 1883; July 24, 1888; and March 31, 1891.

SAN JACINTO ESTATE, LIMITED,
Office of General Manager,
P. O. Address, South Riverside, San Bernardino Co., Cal.
CAJALCO, Dec. 13, 1891.

MESSRS. ADAMS & CARTER, 132 Market Street, San Francisco, Cal.—GENTLEMEN: After a continuous trial of different concentrators comprising the Frue Vanner, the "Hollaod," "Paradox," "Triumph" and the "Woodbury" concentrators), extending over several months, we find that we prefer the Frue Vanner, as it is easier of adjustment, runs smoother, has less wear and tear, and—having a positive travel—gives less trouble than the other more complicated and ever changing machines now in use here. The Frue Vanner not only saves a cleaner concentrate, but has less loss in the tailings, and is in several ways preferable to the other concentrators here.

I am, my Dear Sirs, Yours faithfully,
S. HARRIS, Manager.

Price of 4-foot wide Plain Belt Frue Vanner..... $550, f. o. b.
" " " Improved Belt Frue Vanner..... 800, f. o. b.
" 6-foot " Plain Belt Frue Vanner..... 800, f. o. b.

CALIFORNIA
State Mining Exhibition
AT
THE STATE FAIR OF 1892,
TO BE HELD AT
SACRAMENTO, SEPTEMBER 5th to 17th,
PRELIMINARY TO THE GREAT COLUMBIAN EXPOSITION AT CHICAGO NEXT YEAR.

THE INTENTION OF THIS EXHIBIT is to show mining, as far as practicable, in all its various branches.

A space comprising nearly 30,000 square feet will be devoted to the exhibition of all kinds of Mining Machinery, appliances, and miners' supplies.

A COMPLETE FIVE STAMP MILL will be in actual operation, Also a LARGE ELECTRICAL PLANT showing the appliance of electricity as a motive power.

THIS DEPARTMENT OF THE STATE FAIR will be a distinctive mining display, the first ever witnessed in the history of the State, and is intended to promote interest in this most valuable industry.

All patentees and manufacturers of mining machinery are invited to show their appliances, either in model or actual size.

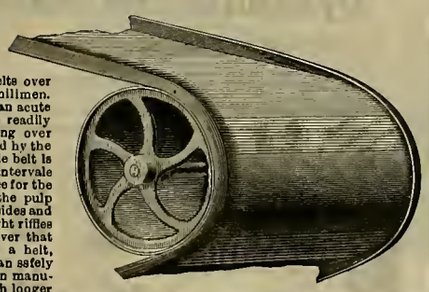
TRANSPORTATION FREE.

FOR FURTHER INFORMATION apply to W. G. SCOTT, Sup't of Exhibit, Office, 22 Montgomery Street, San Francieco, Cal.
Or to G. M. MOTT, Chairman Mining Exhibit, Sacramento.

THIS EXHIBIT IS MADE UNDER THE AUSPICES OF THE STATE AGRICULTURAL SOCIETY, and will receive every assistance possible from said Society to promote its success.

FREDERICK COX, President. EDWIN F. SMITH, Secretary.

THE BLASDEL CONCENTRATING BELT COMPANY.



We have now made arrangements to have our new Improved Concentrating Belt manufactured in San Francieco. We keep always on hand Belts suitable for the Triumph and Frue machines, but can make any length or width desired. The advantages of these belts over *any others* will be readily seen by practical millmen.

First, the flanges or edges of our belt stand at an acute angle inclining toward the center, and therefore readily conform to the change of direction while passing over the end rollers; thus the vexation and loss caused by the frequent breaking of the flanges of the old style belt is practically done away with. Again, our belts, at intervals of two to four feet, have a very slight riffled surface for the space of three inches, which tends to equalize the pulp on the belt, and prevents it from banking on the sides and forming channels through the center. These slight riffles also save very fine sulphurets and the quicksilver that would otherwise escape with the tailings from a belt, the surface of which is entirely smooth. We can safely say that it is a better belt than has ever been manufactured for use on this coast. It will last much longer and will handle fully one-third more pulp than any smooth belt, and will save a higher percentage of sulphurets

H. G. BLASDEL, Jr., Manager, 419 California St., San Francisco.

SCIENTIFIC PROGRESS.

Women Fellows.

The Royal Geographical Society has decided to admit women as Fellows. For many years the society has accepted papers from women, and on two occasions has singled them out for special honor, as when in in 1860 Lady Franklin received the gold medal in commemoration of her husband's discoveries, and when in 1869—a case more to the point—Mary Somerville received the Patron's medal for her publication furthering geographical science. The *Manchester Guardian* for July 7th has the following excellent comment on the decision:—"Papers by lady travelers have frequently been read before the society, and it has for some time been felt to be an anomaly that travelers of the standing, say, of Mrs. Bishop (Miss Isabella Bird) should be excluded from the ranks of a society for which they have done so much good."

While endorsing all this it must be admitted, says *Natural Science*, that there is the strongest objection to the admission of women to scientific meetings as casual visitors; it would probably be advisable to allow only the lady Fellows to introduce ladies, as meetings of a society held for scientific business are very different from Royal Institution lectures.

We do not remember that any society has refused to accept a paper from a woman because she has the misfortune to be a woman, but while accepting her work, most societies refuse to allow her to be present to hear it read. The Zoological Society's principle and practice on the subject are inconsistent: the former admits women as Fellows, "with the same privileges, and under the same regulations in all respects as gentlemen," but while the rules admit women the doorkeeper excludes them from the meetings! The Geologists' Association still maintains its lead in this matter, for it has this year elected a woman whose work ranks high, a vice-president. The Geological Society, however, still refuses women the Fellowship, though it is reported by *Research* (vol. i., 1889, p. 216) that when the subject was last discussed, the reform was only lost by four votes; and, but for the over-confident zeal of the women's advocates, who refused any compromise on the lines suggested above, it would, doubtless, have been carried.

Pumping Hot Water.

A correspondent of the *Engineering News* writes as follows: Is it a fact that the appliance known as the "steam syphon" will not operate in hot water? If this is so, please explain through the columns of the *News* the reason for it; also please inform me as to what is the lowest temperature in which it will operate. Why does not the stream of cold water coming in contact with the steam condense it and cause the atmosphere to force the water back, thus filling the partial vacuum occasioned by the condensation?

To these questions the editor of the *News* makes the following response: The "steam siphon" is not properly a siphon at all. True siphons started into action by a steam jet may be, and doubtless have been, constructed, but what is more commonly known as the "steam siphon" is also and more properly called an ejector or steam jet pump, and these names correctly indicate the action.

Like any other pump, the ejector cannot lift hot water to as great a height as it can cold water. The reason for this is that as the pump reduces the pressure on the column of liquid in the suction pipe, it lowers at the same time its boiling point. If the reduction of pressure be great enough, the boiling point may fall to or below the temperature of the water in the suction pipe; and when this happens, the water gives off steam, which fills the space caused by the upward motion of the piston and leaves the water stationary. Evidently the hotter the water to be pumped the less the possible lift, and this is true whatever type of pump is used. The limits of temperature vary, depending chiefly on the lift and on mechanical construction.

There is, however, an additional reason why the steam ejector will not operate in hot water. It is necessary to the successful operation of every form of apparatus for pumping liquid by a steam jet that the steam should be condensed at a certain point in its flow, otherwise the pipe may be filled with a mixture of steam and water, and the steam may even flow back into the suction pipe.

For this reason steam jet pumps work at a higher duty as the temperature of the water which they handle decreases. If the water to be pumped is at a temperature too high to condense the steam from the jet, the pump may refuse to work at all. We believe, however, that some makers of steam jet pumps supply a special form of pump for handling hot liquids, in which a small auxiliary stream of cold water is used to condense the steam at the proper point.

Plate Glass Casting.

The U. S. Consul at Antwerp, in a report on plate glass manufacture in Belgium, states that the crucibles used are made of Andenne plastic earth, oval in form, having a width of 1.3 by 0.7 meters, a depth of 0.7 meter and a thickness of about 8 centimeters.

Each oven can contain two crucibles, which form one flux. The ovens are heated by cyanogen gas. The mixture of Silician sand and sulphate of soda is only introduced into the crucibles when they are at a full white heat.

The refining and transformation of the excess of sulphate of soda which might remain is produced by the addition at the end of the operation of a certain quantity of coal dust, which transforms this excess of sulphate into sulphite of soda, which abandons its sulphurous acid and becomes silicate of soda.

When the refining is terminated, the oven is allowed to cool for about five hours, so that the matter may become sirupy. By the aid of mechanical cranes and nippers, the crucibles are raised and carried over the flux tables, upon which the matter in fusion is poured.

The flux being made, a hollow, cast-iron roller of 15 centimeters diameter, length equal to the width of the table, and weighing about 700 to 800 kilograms, is passed rapidly over the matter during the time for the matter to assume a consistency capable of bearing a weight of 3000 kilograms minimum, which can compress without extending it. The smaller roller is then replaced by one of cast-iron, turned and polished, with a diameter of about 50 centimeters, its length equal to the width of the table, and weighing about 3000 to 3500 kilograms. By a mechanical contrivance, the roller moves rapidly over the matter until it is cold.

The baking ovens have a perfectly smooth and level bottom of about 8½ by 4½ meters, the vault which covers them having a bend of about 60 centimeters, the whole built of refractory material able to stand a minimum heat of 2000° C. during 60 to 72 hours, heated by cyanogen gas. The ovens being cold, two plates are placed, by means of cranes and chains, in each oven by sliding directly from the table. The ovens having been hermetically closed, the temperature is gradually raised to a minimum heat of 2000° C. and maintained at this temperature for 48 to 60 hours. The cooling process is made in the same gradual manner. The interior of the oven having arrived at the temperature of the surrounding air, the two baked plates are each moved upon a platform moving upon rails, which carries them to the cutting-room, where, by the aid of diamonds and strong nippers, the division is made to the required dimensions.

THE MOON AND THE BAROMETER.—The influence of the moon on the barometer is dealt with by Mr. Bornstein in a recent article in the *Meteorologische Zeitschrift*. He refers to the question as to whether there exists any relation between the pressure of the atmosphere and the altitude of the moon. This study is based upon observations made at four different stations in Germany and Austria, and does not take into account the phases of the moon, or her distance from the earth, but considers merely the lunar day. The results obtained are: 1st, that the variations of pressure do not indicate any atmospheric tides, and 2d, that at three of the stations the pressure shows but one oscillation during the lunar day. At Berlin and at Hamburg the maximum takes place a little before the moon sets, and at Vienna, at the moment of least culmination, whereas the minimum takes place, at all the stations, at the moment of the moon's rising.

PHOTOGRAPHING RIFLE BULLETS.—An interesting deduction drawn from Prof. Boy's successful experiments on the photography of rifle bullets in motion is that the blurring of photographic images, due to atmospheric disturbance, can in many cases be wholly eliminated. The bullets, which were photographed quite sharply, had an appreciably greater velocity of motion than that (upon the average) of the molecules of air. Therefore, with equally short exposure in the case, let us say, of solar photography, the image-forming light is received through a virtually motionless, although, of course, not absolutely homogeneous, atmosphere.

ELECTRICITY.

Electricity and Fire Hazards.

Every newly discovered force added to the list of potentials in the control of man has its usual introductory chapter of mistakes, accidents and alarms. This is one of the conditions of progress and differs only in degree between the experience of an apprentice or an inventor. In the matter of electricity, the old story has been retold, perfection was not instantaneous, and intelligence had to develop with experience. The installation of electric plants for lighting purposes on a commercial scale developed unsuspected and unknown phenomena. The electric spark in its transit made incendiary exits from its conducting lines, making extra work for firemen and more cinders and charcoal than the law allowed. This for a time was a cause of alarm, and added a new terror to the mysterious and invisible potentialities of electricity. It was, however, but temporary and conditional. Ten years ago the science of electric manipulation was raw, indefinite and crude. Invention was not out of its long clothes. Apparatus was cumbersome, and the trained assistant in the handling of apparatus was as yet in an embryonic condition Mechanics were apprentices, supplies were inadequate, and the special steam engine for operating dynamos had been neither planned nor built. These facts in consideration, the frequency of fire due to electric causes can be readily understood. They were simply incidents in the process of what in its early stages of application was largely experimental. The result was a stimulus to investigation and the application of precautions hitherto undevised, for a very excusable ignorance of their necessity. The fire scare, if unavoidable, was beneficial, and evolved the fact that fires due to electricity were preventable by ordinary practical means, and in no sense necessarily inherent in the use of electricity. The fire hazards to day are not those of ten years ago, and electric illumination is now less hazardous than any other artificial method of lighting. It cannot, of course, command perfect service; it has its careless and slip-shod manipulators, and cannot escape the usual percentage of fools, who, with an electric wire as with a mule or a gun, are always found at the wrong end.

Electricity is here to stay. It was not born in a suit of clothes or with six feet of longitude. It has had to grow to its present stature, and is not a matured adult. In the service of gas and steam and every other applied agent or force, the opening chapter was biographical of blunders, mistakes and temporary panics, till the discovery of danger made its avoidance or control a necessity. There are inherent dangers in kerosene, gunpowder and a wet pair of socks, but we annul the hazards by avoiding the causes. The intelligent management of any force develops with its use, and electricity is not left off the list of availability and security. It is the condition of all progress that the need of rare is in ratio with service rendered.—Age of Steel.

WATERSPOUTS.—Peltier observed that waterspouts were generally accompanied by electrical conditions. Might there not be, like cooditions attending the formation of these terrible tornados that are continually doing so much damage in the West? They are practically the same. On water, moisture and spray are the revolving material, while on land it is hut whirling air. This rapid whirling mist produces considerable friction as it rushes through the atmosphere; hence it seems that electricity must be generated. If this he really so, then Franklin's electric chimes ought to serve as a practical indicator of their approach, thus enabling the inhabitants to seek their prepared places of shelter with plenty of time to spare to save whatever valuables they choose. Or supposing that they are due to an electrical condition of the atmosphere, then might not several high towers be erected somewhere in the neighborhood of the city to draw from the clouds whatever charge there may be in them, thus abstracting the initial charge which may, as in the Holtz machine, he absolutely necessary to the formation of one greater and more intense?—Electrical Review.

UNEQUAL WEARING OF ELECTRIC LIGHT CARBONS.—In an electric arc the positive pole is hotter than the negative, the positive showing a temperature of about 4000° C., the oegative showing a temperature of 3000° to 3500° C. This difference of temperature produces a counter electromotive force which acts like ohmic resistance. The cause of the positive pole wearing away twice as fast as the negative is due to this difference in temperature.

USEFUL INFORMATION.

The Efficient Left Hand.

Left-handers are notably of more than the average strength and much more than the average accuracy of the eye. Leonardo da Vinci and Hans Holbein were left-handed. Left-handed batsmen are noted for hitting, left-handed fielders for smartness, and left-handed bowlers are generally fast. We know a gentleman, not a straight bat, whose back play is a perpetual source of astonishment to the spectators. But now comes in a factor of unknown quantity. One would think that where conventional usage has obtained from the left-handed one particular set of motions for the right hand, it would he one requiring but average skill. But is this so? The three arts of cricket are distributed among left-handed people in the most arbitrary and apparently inconsistent manner; most of them hat left-handed, but many bowl with the right, and some hat with the right and bowl with the left. No doubt it would be found that, on the whole, those actions requiring the utmost nicety and the greatest accord between eye and limb are allotted to the superior hand; again, spontaneous gestures and unstudied actions would also he performed by the same hand.

It is a remarkable fact that with the majority of people the neglected left hand is not in mere strength inferior to the right. We have heard truly right-handed people actually declare that their left hand is the stronger, and from the present writer's own experience he knows this to he the case. This may be from the mechanical advantage and better balance of the body, the right side being heavier, or it may be due to the large muscles of the unused arm being less hampered by the development of other muscles. It is difficult in these cases to say which is the "right" hand, for the fact that the unused arm is the stronger does not imply ambidexterity, nor can we justly give the precedence to strength over dexterity.—Boston Transcript.

HOW SPECTACLE LENSES ARE MADE.—In the manufacture of spectacle lenses, says the *American Manufacturer*, the bit of glass to be formed into a lens is fastened by means of pitch to a small block of hard rubber, so that it may be held. It is ground by being pressed against a rapidly revolving cast-iron disc on a vertical spindle, and with curvature equal and opposite to that desired in the lens. This is the "rough tool," and is kept moistened with emery and water. Several grades of emery are used in succession, changing from coarse to fine as the grinding proceeds. The glass is then transferred to the "fine tool," made of brass, and compared from time to time to a standard curve to insure accuracy. In this second grinding the abrading material is rouge. Finally, the lens is polished by being pressed against a piece of cloth powdered with rouge and fastened to a rotating tool. The glass is now loosened from its block, turned over, and the reverse side of the lens ground. When this has been accomplished, the lens is placed on a leather cushion, and held firmly in position by a rubber-tipped arm, while a diamond glasscutter passing round an oval guide traces a similar oval on the glass below. The superfluous glass is removed by steel pincers and the rough edges are ground smooth on scotch wheels.

ALLOYS FOR BORING TOOLS.—Some new alloys for the manufacture of boring and cutting tools are announced in the Sheffield (Eng), papers, and which are said to posess a hardness equal to that of tempered steel, with the advantage of not losing their hardness when heated hy friction. In making these alloys, pig iron, ferro-manganese, chromium and tungsten are melted together in graphite crucibles under stick charcoal and calcined borax, the tungsten and pig iron beiog preferably melted in clay crucibles together with the bar iron—the nickel, copper and aluminum being subsequently added. The metal is this time covered with stick charcoal only, and the alloys are cast in sand molds. For nail cutting blades, cutting blades for machines, cutting-out tools, and the like, the alloy consists of a combination of pig iron, Swedish bar iron, ferro-manganese, chromium, tungsten, aluminum, nickel and copper.

AN iron trolley pole, says the *Electrical World*, is no more dangerous from an electrical shock than one of cedar when the former is set into the earth so as to form a good "ground" connection. It is then at the same potential as the earth, and a current flowing through it is perfectly harmless.

Educational.

JOHN T. EVANS,
Assay Office and Chemical Laboratory,
ROOMS 46 AND 47 MONTGOMERY BLOCK, 628 Montgomery Street, San Francisco. For nearly 15 years with Thomas Price, as Chief of the Ore-Assay and Analytical Department. Lessons given in Assaying and Chemistry.

School of Practical, Civil, Mechanical, Electrical and Mining Engineering,
Surveying, Architecture, Drawing and Assaying,
723 MARKET ST., SAN FRANCISCO, CAL.
Open all year.
A. VAN DER NAILLEN, President.
Assaying of Ores, $25; Bullion and Chlorination Assay, $25; Blowpipe Assay, $10. Full Course of Assaying, $50.
ESTABLISHED 1864. Send for Circular.

HEALD'S
BUSINESS COLLEGE,
24 POST ST., S. F.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned

CALIFORNIA.

Amador.

ZEILE.—Amador *Ledger*, Aug. 13: It is reported that repairs to the shaft of this mine will be undertaken next month. The air shaft, which caved a few weeks ago, has not been put in shape since. They simply made an opening through the debris so as to restore ventilation It is likely that this shaft also will be thoroughly repaired with the main shaft. The work will take two or three months to complete, and during this time most of the miners will be laid off The sulphurets have accumulated, so that the supply now on hand is sufficient to run the works for about two months. As most of the gold is obtained from the sulphurets, the net yield of the mine will not be interfered with to any extent during the suspension of underground work.

BAY STATE.—The Bay State continues to look well. They have a four-foot vein of fine ribbon rock in the north drift and a three-foot ledge in the south. The ore is undoubtedly of a paying character. The presence of a considerable flow of water is thought to be an indication that the main ore-body has not been found yet, and a crosscut is being run with the object of cutting it. Altogether, the prospects for a solid mine continue to be good. The stock has stiffened, and none can be had without a considerable advance on cost price.

SOUTH EUREKA.—At this claim the prospects are decidedly improving. The vein has widened out to six feet, and its quality has also improved. The ore is estimated to yield $4 per ton by mill process. This is still a very low-grade proposition, and one which, as the maximum grade of rock, would hardly justify the erection of mining and milling plant. But the increasing size and gold-bearing quality of the quartz justifies the hope that better things are yet in store.

FAVORABLE OUTLOOK. — Amador *Dispatch*, Aug. 13: Messrs. W. W. Scott and Wm. Sturneman, proprietors of the Pinevetta mine, near the old Ledford ranch were in town last week. They are highly elated at the favorable outlook of their mine, as they have recently struck a well-defined ledge of very rich rock. The ledge, so far is from 12 to 24 inches in width, but shows indications of widening as they go down. They estimate that they have at least $10,000 worth of ore in sight already, and it is not yet known how much more ore is yet uncovered.

THE LEDGE AT THE SOUTH EUREKA.—Amador *Record*, Aug. 11: The *Record* is able to chronicle still more cheering facts this week regarding the South Eureka mine. The north drift was in 75 feet on Tuesday and the ledge has widened out to 12 feet. The last assay made gave the ore a value of $5.30 to $6.20 a ton, and its quality is still improving. Operations will be prosecuted and the mine opened up with all the vigor that faith, backed by capital, can inspire, and should these encouraging developments continue—there is no doubt now that they will—we may expect to see things "booming" at the South Eureka, and a consequent revival in Sutter Creek of the times that once distinguished this place as one of the most flourishing mining camps in the State. It is characteristic of all the great bullion-producing mines on the mother lode to be the poorest at the 500-foot level. It will be understood that the present depth of the South Eureka is virtually on a level with the surface where the famous Eureka shaft was sunk, and it was at a depth of 500 feet where the first great strike was made in this latter mine.

THE BELMONT.—At this mine a sinking of 130 feet in the Boss shaft has been completed. A station is being opened on the 200-foot level preparatory to cross-cutting and drifting on the vein. We expect to soon be able to chronicle very important developments from that work. One of Knight & Co.'s No. 4 blowers is being placed in the mine. It will be run by a six-inch wheel and will supply the lower levels with an abundance of fresh air.

Butte.

BLUE LEAD NEAR OROVILLE.—*Register*, Aug. 11: Some years ago a deep shaft was sunk on the bluff near the depot and a blue cement some 70 or 80 feet in depth was passed through. Below this, river sand was reached, and it was thought the shaft was nearly down to bedrock, but the volume of water that rushed in was so great that it was impossible to keep it down, and the shaft filled up within 40 feet of the top. Those who worked in the shaft think that this deep bed of blue cement is a part of the great river channel found near Bangor and Wyandotte, which is turning out such rich pay. It is known that this blue lead stretches this way from Bangor past Wyandotte and Garden ranch, and experienced miners firmly believe that the same valuable channel of rich gravel exists in this vicinity. The shaft spoken of was struck at a depth of 60 feet. There was no trouble from water till the men reached the lower part of the blue cement, but the moment that was passed, the water rushed in rapidly. Those with whom we have talked about this matter think that if the bedrock beneath this gravel could once be reached, that it would be found enormously rich. John Toland, Mike Lout and Sam and Henry Downing are all familiar with the old shaft, as they helped sink it.

Humboldt.

THE GARBERVILLE OIL WELL.—*Western Watchman*, Aug. 13: Superintendent Gilfillan of the East Branch oil well, near Garberville, was in Monday for the purpose of getting dynamite with which to knock obstructions out of the way of the drill. In going down through the soft sand rock they struck a hard boulder, imbedded in the softer formation. If the drill had struck it fairly they could have pounded their way through it, but they struck it on the side, causing the drill to glance off, the tendency of which is to make a crooked hore and thus bind the drill. Mr. Gilfillan proposes to send down a charge of dynamite and blow the hard-headed accidental intruder to smithereens. As the joint reached is in oil-bearing rock, it would not be at all surprising if that charge should start an active flow of oil.

Nevada.

WYOMING MINE. — Grass Valley *Telegraph*, Aug. 13: The Wyoming quartz mine is situated on the east side of Wolf creek in Boston ravine and is being worked by a company, with Benjamin Reynolds as principal. Yesterday afternoon a ledge two feet in thickness was found at a depth of 35 feet in the mine, and it is filled with sulphurets and galena, and free gold can be seen on many places in the rock. The prospect is very encouraging.

THE DELHI.—Nevada City *Herald*, Aug. 11: At the Delhi, last week, some specimen ore was taken out which was about half gold. In sinking ten feet some 20 tons of ore were extracted. Robert McMurray states, however, that the mine is petering out, and that he is seriously thinking of shutting down. The ore is about gone in the present pay shoot, and to sink farther will require machinery costing $25,000, an outlay which the company does not feel justified in making. It seems too bad that this famous mine is worked out. It has been a great producer.

OMAHA MINE.—Grass Valley *Telegraph*, Aug. 11: Mr. George Mainhart informs us that he is firmly convinced that the Omaha mine will be its old self again in a few weeks at the farthest. The indications now are favorable indeed, and Mr. Mainhart is fully confident that he will soon reach what he has been seeking and running for. Several days ago eight or ten men were laid off from the mine on account of there being no room for them to work, but it is fully expected that all of those men will be put back, with also an additional force.

RICH ROCK —There was quite a crowd gathered around the store of Wm. Treolar this morning to see the rock brought up from the Cabbage Patch mine. Richard Vincent brought up the ore, and it came from the depth of about 40 feet, the ledge being about one foot in thickness. The ore was filled with free gold and gold-bearing sulphurets. The mine is owned by Grass Valley parties.

Placer.

DOING WELL.—Placer *Herald*, Aug. 13: The mines on the Forest Hill divide are doing well, and the prospects indicate for that section a more than usually good season. At Iowa Hill and Damascus the mines are holding their own, and those places continue to turn out a good deal of money. There are some drift-mining developments at Dutch Flat that indicate better times for that locality. The quartz mines of Auburn and Ophir are doing some work, though they are not as active as we would like to see them.

Plumas.

SPANISH RANCH.—Cor. Plumas *National Bulletin*, Aug. 13: The mining industry in this section is going rather slow at present. The water season being over, only the drift and quartz mines are active. The Murdock Bros. and Ericson & Co., are working their mines steadily, with the usual good results. These gentlemen possess good mines, and if allowed to work them by the hydraulic process, would realize large fortunes in a short time. The Shenandoah Co. has a large force of men at work constructing a new ditch, taking out quartz and doing development work, the results of which are said to be flattering.

San Benito.

THE GYPSY MINES —Hollister *Advance*, Aug. 11: A syndicate of capitalists of San Jose and San Francisco have combined to develop the Gypsy quicksilver-mining property. A large force of men is to be put to work at once, building furnaces, sinking shafts and running tunnels. Brick will be burned at the mine, under the supervision of Mr. J. Dorn, of Hollister. About 500 tons of material will require transportation from Hollister to the scene of operations, and this will afford employment to an army of teamsters. The development of this property will add greatly to the trade and prosperity of Hollister.

San Bernardino.

MORONGO DISTRICT. — Redlands *Citrograph*, Aug. 13: The Morongo district is coming up at a rapid rate as a good mining section. Late strikes in the Rose and other locations promise well. An onyx mine is being worked in a small way, and the output of gold and silver will be notably large in a couple of years. The most comfortable way to reach the district is through Bear valley.

GOLD.—Riverside *Phœnix*, Aug. 11: A brick made of gold worth $1105 was brought home by Messrs. Twogood & Herrick from the Rose mine, in which they are interested, a few days since. The mine is located in the Morongo district, and great things are expected in this section.

Siskiyou.

DAMS.—Siskiyou *Telegram*, Aug. 13: There has been considerable talk and worry among the miners on the Klamath river in regard to the dams across the river put there for the purpose of stopping the flow of water, allowing it to collect in vast bodies, and then, by lifting the gates, float their logs down the river to their mill, which is located at Pokegama. This the miners object to, as when the gates to the dam are shut down, the water in the river falls about 20 inches, which stops all their water wheels, which they use for pumping the water off the bedrock, and stops the work of their mines completely, while on the other hand, when they lift the gates and allow the water to rush down the river in vast torrents, it floods the mines, sweeps before it all the water wheels, sluice boxes, tools and in fact all the machinery. Florian LeMay, who has charge of the Phil Mott mine, on the river, was over last week and had an interview with the millmen at Pokegama, endeavoring in some way to come to an understanding on this important question, and it is hoped that it will be amicably arranged.

SALE.—A very important sale of mining property has just been negotiated at Sawyer's Bar. Mr. Stent, a practical miner and prospector, located several quartz mines in that district, and has just disposed of one of them at a figure with four ciphers in it. The purchaser is the Gladstone Mining Co. of Shasta county, with a mint of money behind it, and the property will be developed and worked on a scale that will boom the Sawyer's Bar district. We congratulate Sawyer's Bar at having such a company become interested in that locality, and we predict that they are only the forerunners of other companies that will seek investments and open up the quartz mines, over the divide. Mr. Stent, although a very modest and unassuming young man, is nevertheless quite a "rustler," and well deserves his good fortune.

NEVADA.

Washoe District.

CON. CAL & VA. MINE.—Virginia *Chronicle*, Aug. 13: 1500 level—From the south drift at point of connection with the old stopes we continue to extract some ore and fillings of average milling value. From the upraise which was carried up from the end of the crosscut run west 36 feet in from the main south drift, 155 feet south from the shaft station, we have continued to work upward and to extract ore of fair quality. 1650 level—Continued to extract some ore from the drift run east from the winze No. 3 (down 73 feet) in working upward from that point; also some ore from the old stopes at the north end of the California ground. In working upward from the drift run north from the bottom of the winze sunk 28 feet in this last locality through the old timbers, have continued to extract a few tons of milling ore. 1800 level—Along the south end of the drift running south from the crosscut run east from the winze No. 1 sunk from the 1750 level, we have continued to extract some ore from the sill floor upward of milling value. From the bottom of winze No. 2, down 45 feet, the west crosscut No. 2 has been advanced 19 feet; total length, 43 feet; in a quartz formation of very low assay value. There has been extracted from all parts of the mine during the week 991 20-2000 tons of ore which was shipped to the Morgan mill, the average value of which per car samples was $28.28 per ton. The average assay value of all the ore worked at that mill during the week, 980 tons, was $24.89 per ton per battery samples. Bullion shipped to Carson Mint, assay value, $15,323.90. Bullion on hand in our assay office, assay value about $14,200.

OPHIR.—1465 level—From the south drift, 101 feet below the sill floor of the 1465 level, at a point 84 feet in from its mouth, the west crosscut has been advanced 16 feet; total length, 100 feet, continuing in a quartz formation showing clay separations and carrying a very low assay value.

MEXICAN.—On the 1465 level the drift running north from the crosscut run east from the bottom of the winze sunk 101 feet below the sill floor of this level near the south boundary of the mine, at a point 40 feet east from the winze, has been advanced 15 feet; total length, 224 feet; continuing in vein porphyry with some clay.

UNION CON —900 level—The joint Union Con. and Sierra Nevada west drift has been extended during the week 23 feet; total length west from the joint shaft, 2300 feet. The face is in soft porphyry, with small stringers of quartz of low grade.

UTAH.—340 level—From the end of the north drift (at a point 432 feet in) from the west crosscut from the shaft station, west crosscut No. 2 has been extended 35 feet; total length, 172 feet; continuing in porphyry, clay and quartz.

SIERRA NEVADA.—The east crosscut Kenosha tunnel, started 200 feet south of crosscut No. 1, has been advanced 36 feet; total length, 106 feet; face in porphyry. The joint Sierra Nevada and Union west drift, 900 level, has been advanced 23 feet during the week; total distance west of shaft, 2300 feet; face in soft porphyry with stringers of low-grade quartz.

ANDES.—East crosscut No. 1, north on 420 level, advanced 19 feet. Total length, 55 feet; formation, porphyry and quartz.

GOULD & CURRY.—200 level—During the past week we have extracted 77 cars of ore from the old stopes on the 200 and 400 levels, the average car sample of which is $23.79. We will start to ship this ore to the Occidental mill to-day. On the Sutro tunnel level the joint north drift with the Savage Company has been advanced 20 feet; total length, 497 feet; face in porphyry. We have also been easing timbers in the joint upraise.

BEST & BELCHER.—900 level—Have resumed work in the north drift started from east crosscut 100 feet from switch and extended the same a distance of 16 feet; total length, 70 feet; face in porphyry and stringers of quartz.

HALE & NORCROSS.—1800 level—During the week advanced the north drift 20 feet; total length, 90 feet; face in hard porphyry. The south drift on this level was advanced 15 feet; total length, 75 feet; face in hard porphyry. A portion of this drift was timbered during the week. These drifts are still being continued outside and east of the ledge.

CHOLLAR.—Are repairing the raise from the 550 to the 450 level. Have started a crosscut 160 feet south of the north line, 930 level, which is now out 13 feet; face in porphyry.

POTOSI.—Are running a drift south from Potosi winze, 48 feet below the 1000 level. At a point 120 feet east of Potosi winze, 1100 level, are running a drift north in five feet of quartz that assays $15. Are drifting south from east crosscut 40 feet north of Potosi winze 1500 level, in two feet of fair-grade quartz. Potosi winze is down 452 feet below the 1500 level; bottom in quartz and porphyry. The northwest drift from the 1800 station, Ward shaft, has a total length of 710 feet; face in porphyry. Have repaired 50 feet of the drift during the week. Extracted and sent to the mill during the past week 368 100 2000 tons of ore from the 930, 1100, 1150 and 1300 levels. Milled during the week, 400 tons.

BULLION —Have started an upraise from east crosscut 320 feet south of north line, 1300 level; top is in quartz and porphyry. The joint Potosi winze is down 452 feet below the 1500 level; bottom in low-grade quartz and porphyry. The northwest drift from the 1800 station of Ward shaft has a total length of 710 feet; face in porphyry. Have repaired 50 feet of this drift during the week.

WARD COMBINATION SHAFT.—The joint Alpha and Exchequer south drift from the north line of Exchequer, 1800 level of Ward shaft, has a total length of 370 feet; face in porphyry. The joint Bullion and Potosi northwest drift from the 1800 station has a total length of 710 feet; face in porphyry. Have repaired 50 feet of this drift during the week.

ALPHA.—The joint Exchequer and Alpha south drift from north line of Exchequer, 1800 level of Ward shaft, has a total length of 370 feet; face in porphyry.

EXCHEQUER.—The joint Exchequer and Alpha south drift from north line of the Exchequer, 1800 level of Ward shaft, has a total length of 370 feet; face in porphyry.

SILVER HILL —Are repairing and changing the grade of the northwest drift, 200 level.

IDAHO.

THE DIXIE DIGGINGS.—Elmore *Bulletin*, Aug. 11: Perry Sprowl came in from his south Boise ranch Thursday and reports considerable activity in the Dixie mining district, about 25 miles from Mountain Home. A large number of prospectors are in that section and new and valuable gold ledges are being daily discovered. Wilson & Co. have a shaft down on their claim to the depth of 60 odd feet, and the ore, all the way, is remarkably rich in gold. The ledge is only about two feet in width, but from numerous assays it averages 58 ounces in gold to the ton. Sallisbury, the stage man, owns a claim near the Wilson, the ledge of which is three feet in width and a working test of the rock returned $100 per ton in gold. The rock is considerably decomposed and when water was plenty near-by, during a rainy day, the Wilson boys ran a lot of this soft ore through a sluice and cleaned up $70 of the shining stuff. Mr. Sprowl says that 40 or 50 new locations have been made in that section recently and that they are all very promising.

AROUND QUARTZBURG.—Cor. *Idaho World*, Aug. 2: I wish you would allow me space in your most valuable paper for a few items from our burg and the famous Gold Hill belt of quartz mines which has been the feeder of all the rich placer mines in this section of the rich Boise basin. This rich belt of quartz extends from Canyon creek, southwest of Boise basin, to Grimes Pass on Grimes creek, on the northeast of the basin. The creeks and gulches of this section, which have produced hundreds of thousands of dollars, have cut through this rich belt of quartz. I have traveled over this gold belt for 25 miles in length and found it from three-quarters to one mile in width. I was surprised to find such a large number of mines located on this belt. I will give the names of those I saw on my travels. On Granite creek and its tributaries are located the following: Gold Hill Co.'s mines, including the Gold Hill, Pioneer, Confederate, Dunlap and Lone Star. This company's mill has been running successfully for 25 years. It is a common remark in Quartzburg that the Gold Hill mill and county tax collector are always on the move. The Eisler, Iowa and Yellow Jacket lodes, owned by D. E Coughanour, and Tincher lode, owned by John Dickinson, are near the Gold Hill. On the West Fork of Granite creek are located the Newburg and Alice, owned by Mr. Sheridan; May Flower, Homeward Bound and Homestake, owned by Crossin, Williams & Co. The last mentioned five mines are under bond for a very large sum to Wm Sweet, who is employed by a Boston company. On Canyon and Fall creeks and tributaries are located the Homestake, owned by John Hanlen; Ebeoezer, owned by Gorman, Cougban ur & Co.; Belshazzar, Centennial and Bell Flower, owned by Geo. Tew & Co.; Mountain Chief, owned by Knight & Co.; Idaho mine, owned by Mullen, Carroll & Co. A large amount of ore has been extracted from several of these mines on Canyon and Fall creeks, and has paid very well. On California gulch is located the Carroll Brothers' group of mines—Ivanhoe, New Tipperary, Monarch and Clifton—which a Colorado company lately purchased; Yellow Jacket, Extension, Capital and Kennebec, owned by Driscoll & Bell; Mt. Etna, owned by K. P. Plowman; Mountain Lion, by Lamberton & Newby; the Blue Bird, by Carroll Bros; the Jersey Blue, by Mullen & Carroll. The Smith, Barber & Gardner lodes are located on this lode, and several others which I will mention some other time. All the mines mentioned carry a large percentage of iron sulphurets. When the MacArthur-Forrest cyanide process is put in operation for the working of the sulphurets of this belt, times will be good in this section. One cyanide plant has been built on Granite creek and another is in course of construction below Placerville, at the junction of

Granite and Wolf creeks. The Gold Hill mill continues to run regularly day and night on good ore from the Pioneer mine. D. E. Coughanour, the enterprising mining man of our town, has a crew of men at work in a tunnel to tap the Iowa and Eisler leads, about 500 feet deep. Quartzburg is the only town located on this great Gold Hill belt, and every man is working.

THE CHAMPLAIN GROUP OF MINES.—Wood River *Times*, Aug. 6: A half interest in the Champlain group of mines has just been sold for a consideration of $20,000. The transaction was consummated on the 20th of July. Chicago parties were the purchasers. This promising property is situated on the Gold Belt, about three miles from the Camas No. 2. It was owned by L. C. Bailey, and had not been worked for some time prior to the resumption of operations this spring. Since that time it has continued to develop well, and is now showing up satisfactorily. In this connection we cannot refrain from saying if ample capital were invested in the mining industry in this region to secure thorough development of mines, the returns would undouhtedly justify the outlay.

OREGON.

NICKEL.—Jacksonville *Times*, Aug. 11: Judge Crawford of Medford was at Elk creek lately to examine a large deposit of ore, claimed to be nickel. He reports large croppings of that ore. Samples have been sent away for assay. If the per centage of nickel in the ore is sufficiently large, the mine may prove very valuable.

NEW MILL.—The company which purchased the Anderson gold quartz mine in Wagner creek seems greatly encouraged by the outlook. The superintendent. Mr. Wilson, reports that the developments down to 250 feet show a continuous body of sulphuret ore of almost regular width. The company received its machinery from the new mill at Ashland last week. It is proposed to erect the machinery at the old planing mill site in Ashland, and to utilize that power. The mill and concentrator are erected under a special contract with the inventor, who guarantees a success. The mill crushes the ore, not with stamps, but with rolls, and the crushed ore does not pass over plates, but into the concentrator. The concentration of the copper and iron pyrites in the ore will be accomplished by fans and air currents, blowing the "gangue" away like chaff. The concentrates will be shipped to smelters. A capacity of 70 tons a day is claimed.

THE ORME MINE.—Rogue River *Courier*, Aug. 13: The ledge being developed by the company composed of Messrs. Boynton, McFerson and Orme, promises to make its owners rich in the near future. This ledge adjoins the famous Jewett mine about four miles from town on Old Baldy. It was a blind ledge and was discovered with a pick and pan. The lowest assay fignres $61.15 to the ton, and the highest reaches $400. The spur of the ledge is 20 inches wide between well-defined walls, but the main ledge is much wider. A shaft is being sunk and the men are down 20 feet. The ledge is widening and the rock getting richer as the sinking proceeds.

SOUTH DAKOTA.

THE MINING OUTLOOK.—Deadwood *Pioneer*, Aug. 11: Never before in the history of the Black Hills has the mining outlook been so bright. Eastern investors and speculators have had their attention called to the unparalleled opportnnities offered for investment, and a large amount of money is being daily put into the mining industries of the country. The recent pnrchases of Eastern parties of some of the most promising mining interests in Bald mountain means the speedy erection of large reduction works to treat the vast hodies of ore, which will in all probability he located in Deadwood. All the plants so far erected are running with much success, and each day adds to the output. The Homestake group continues its steady production, and reports from the Caledonia, based on the statements of those who are supposed to know, indicate that it is paying better now than it has ever done. Recent discoveries on the lower levels of rich ore hodies have materially added to the value of the property, and will soon place it among the dividend-payers. In the southern Hills, development work on the Keystone has shown it to he of immense value, and St. Paul parties who recently purchased it, have enough faith in its richness to erect a 120-stamp mill to work the ore. The J. R., in the same direction, is now on a paying basis, and the Spokane, Calihoga and many others are only awaiting railroad facilities to hegin work on a large scale. The Harney Peak Tin Co. will start its mill sometime in November and hegin the production of American tin. In the western Hills the Inter Ocean continues to show up well as the development progresses. In two months the mill will he running. It will he fitted up with concentratora and all improvements necessary to save the precious metals. A great deal of prospecting is heing done in this section, and everything points to a series of hrilliant strikes.

WASHINGTON.

THE TRIUNE MILL.—Okanogan *Outlook*, Aug. 11: Sharpneck & Dexter returned last week from Chicago, hringing the welcome news that the machinery for the Triune mill has heen pnrchased and was on the way in. It is to he a ten-stamp mill at first, hnt will he built and furnished with a capacity and power to operate 20 st mps. A 50-horsepower Corliss engine will furnish motive power for running the mill and two steel cars, of a capacity of 2000 pounds each, will he used in transporting the ore to the mill, which is to he located withiu a few yards of the ore hody. Sharpneck & Dexter have entered into a contract to put in the mill for a third interest in the mine, and have already put a force of men at work grading the site and getting material on the ground for the huilding.

MARKET REPORTS.

Local Markets.

SAN FRANCISCO, Aug. 18, 1892.

There was a marked increase in the volume of goods sent out the past week, with the shipments to upcoast ports showing, if anything, the largest gain. The spirit of conservatism still dominates, for seldom can the best traveling salesman induce interior merchants to huy mucb beyond near-by wants. Remittances are slow, but then there is no scarcity of funds; and althougb large sums of money are being called for with which to make advances on grain, yet conservative bankers do not look for any friction in the money market. The large engaged tonnage in port for wheat-loading will give a good supply of hills on Europe, while the large disengaged tonnage assures of the supply heing continued for the next 90 days. Possibly the only unfavorable outlook at present is that the price of wheat may go to such lnw figures that for self-protection farmers may combine to hold back supplies, in which event ships will experience considerable difficulty in getting cargoes. Our advices from the agricultural districts report fruit-harvesting still under full-headway, with the larger proportion of the crop contracted early in the season. The high markets for California green fruit at the East are causing more to be shipped green than ever before. Tbe shipments are creating a scarcity, in some localities, of refrigerator cars. Advices from the various gold-mining districts are of a most promising character. They indicate more active and prosperous times. There is a quiet but rather persistent inquiry for good mines which are either developed or in the course of development. Eastern mail advices report business in several branches suff ring by reason of labor strikes. Of necessity, with labor discontented, all industrial branches are unfavorably influenced. The leading financial centers report money easy and that the requirements for crop purposes will fall considerably below the wants in last year. The falling off, it is claimed, will he due to lower prices and shorter crops. Short crops are reported in all kinds of grain, fruit and potatoes, while the cotton outturn will be considerably below that in 1891, and a short cotton crop cuts a very important figure. The International Monetary Conference is receiving more than usual attention at home and abroad. This, no dnubt, is largely due to depressed trade the world over, and a general desire of discovering some means by which the various industries can be galvanized into life and more general prosperity follow. While the prevailing opinion, and we might say the only opinion expressed, is that the conference will not do anything to remonetize silver, yet, under broad discussions on the financial situation, much light will be thrown on the silver problem which will lead to educating the masses, so that silver in all its bearings on the trade and commerce of the world will be better understood and bear fruit within the next few years. This opinion is well-voiced by the expressed views of Comptroller of the Currency Hepburn who says: "Whether tbe proposed silver conference shall produce immediate results or not, it cannot fail to be of great advantage to this country." "The capacity of Europe," he said, "to misunderstand America and things American is proverbial. The sending abroad nf so strong a body of men as the Commission named by President Harrison must result in educating Europe to the exact condition of our monetary affairs and resources and the trend of public sentiment bere. That there is not gold enough to furnish currency for the whole world is generally admitted. That silver with some proper ratio, or in some degree, must be utilized, is also generally admitted, and an International Conference like this will serve to concentrate all eyes on their discussion, and the result of their deliberations will reach all ears. The conference must be of great benefit as an educator, even if no immediate results follow."

SILVER—On Friday and Saturday the lowest recorded quotations came through from Londnn and New York. On Monday there was a slight recovery, said to be due to the shorts filling. Our New York exchanges are confident that the market will sell down to 80 cents in New York before there is much of an upmove. If silver is, as we confidently believe, under strong manipulation, the bears may be disappointed and much higher figures be reached before the lowest points are toucbed. Markets under manipulation usually work by the rule of contrary. The International Monetary Conference will probably be held in Brussels in the month of October. There was exported to Japan, the past week, $46,000 of hullion.

MEXICAN DOLLARS—Exports the past week aggregate as follows: China, $227,587; Japan, $108,150; total, $335,737. The market ranges from 66¼ to 67¼ cts.

QUICKSILVER—Receipts the past week aggregate 418 flasks. The market is irregular with buyers reporting concessions.

BORAX—Receipts tbe past week aggregate 846 centals, and exports by sea 1230 centals. The market is quiet but steady.

LIME—Receipts the past week aggregate 5124 bbls., of which 1275 bbls. came from up north. The consumption continues large, but the market is irregular with more or less cutting reported. Quotations furnished range from $1.25 to $1.50 per bbl.

PIG IRON—Imports the past week aggregate 302 tons from New York. The market continues to he reported in buyer's favor under free offerings of American. The lnw freights from New York are in favor of importers. Mail advices from New York report as follows: Pig iron is dull and weak in all markets, Pittsburg recording a further slight decline in the price of Bessemer pig. Monthly statistics how a sharp decline in current production, the total coming down to 155,000 gross tons per week. The South has thus far not participated in this restriction, a fact which explains its leadership in the decline and the weakness of the producers of that section.

TIN—Imports the past week aggregate 942 boxes plate from Liverpool and 214 pigs from San Diego. The market is inactive and barely steady. Fruit canners have taken a much larger quantity than had been estimated.

PIG LEAD—The market is essentially unchanged. The Eastern markets are dull and tame, with buyers not taking much interest in it.

COPPER—The market is dull and heavy. New York mail advices note a fairly steady market, with no selling pressure. In their private circular of August 2d, James Lewis & Son say: "The prospects of reduced supplies later on, due to the combined action now in force on the part of the chief producers of copper to restrict their production, has had little or no effect upon values so far, as it has been neutralized by the excessive production of the American companies prior to the 1st ult., and an increase in stocks here. As it is generally believed that the cost of producing copper by the Calumet and Hecla Company of Lake Superior is lower than that of any other copper-mining company, in the absence of any annual balance sheet we find that during the seven years, 1885 to 1891, an average dividend of $17.71 per share was declared on 100,000 shares, or a total of $1,771,000, and that during this period the average annual production of copper was 52,369,000 pounds, the average value in New York being 13.13 cents per pound. As the dividend represents 3.38 cents per pound, the cost of production (including expenditure on construction) would appear to be 9.75 cents per pound, equal to £46 5s. 0d. per ton, with 2½ per cent discount.

COAL—Imports the past week aggregate as follows: Coos Bay 800 tons, Liverpool 3589, Swansea 5951, Nanaimo 4935, Seattle 4720, Departure Bay 2252, Tacoma 2160, Total 24,407 tons. While the market is reported unchanged in quotations, yet there is an undertone of strength which indicates better prices later on. The consumption is not as large as had been expected, but it is claimed that after this month the demand will begin to increase. The higher freights from England and Australia are against importers.

Mining Share Market.

SAN FRANCISCO, Aug. 18, 1892.

Trading has been very light; even cross-orders were not played with the usual vim which characterizes the mill rings and stock pools. So far, Bob Morrow and his brokers have not been able to execute the reported order of D. O. Mills to send the market lower, but his usual cat-like actions appear to he pronounced lately, which lead the better-informed to the opinion that he is waiting a favorable opportunity to jump on the market and send prices down with a rush. Those who are said to be in a position to know claim that Mr. Morrow and his brokers may have to advance prices slightly before they are able to successfully execute the reported order of D. O. Mills. The mines warrant much higher prices than are now quoted, but experience has taught that with the mines managed by dummies, the mines are one thing and the share market quite another; or, in other words, it makes but little difference how large and rich is the ore uncovered in a mine—all that outside shareholders get under the present system are assessments, while the rings get the hullion. This one-sided conditinn of affairs is creating the opinion that the Mining Stock Association ought to stop civil suits and commence criminal proceedings (unless a bona fide reform movement is inaugurated by the rings) against those that members of the association claim have been guilty of misappropriating funds. Such a course would bring about quicker and probably better results than the seemingly long-winded civil suits which allow the inside rings to continue looting the mines, while their dummies levy assessments to pay for the work and, at the same time, freeze out shareholders. The Brokers' Combine might also take a hand at the game. This reminds us that nothing has been heard lately about the Combine. There are several brokers in it who are known to he fighters, and who the insiders have good reason to fear. Why do they not come to the front? Now is a favorable time for cnncerted action. Perhaps they are waiting to see if such refnrmers (?) as Gen. R. Wells, Charley Hirshfeld, H. Zadig and a few others will not institute reforms of a beneficial character. It is the opinion of the many on the outside, that when those who have had close relations to the inside, work in the interest of outside shareholders, the time has arrived when the evil one will be chained and the millennium commenced.

Miners say that no work has been done in the Julia mine for a long time, yet the president of the company, it is said, draws a salary of $200 per month, while other seeming sinecures draw good salaries. It is claimed that the Julia is not the only Comstock company which pays good salaries to officers for doing nothing. C. Hirshfeld is vice-president of the company. Why does he not make reforms in this and other mines of which he is an officer or director?

George R. Wells and H. Zadig, the stockbroker, have not done such wonderful things with the Occidental mine. Those in position to know say the mine should pay dividends. The superintendent's reports ought to conform to the law under which the company incorporated.

Our New York exchanges are quite bullish on the situation, and predict an active hull campaign in mining shares before "snow flies." It is to be hoped that they are right, but as long as there is large profit in mine looting, so long will the public he denied everything except assessments.

It is now claimed that the three bars of stray hullion mentioned in last week's issue have been traced to the Hale & Norcross. If this is so, then in what a position it places Attorney-General W. H. H. Hart, who is a director in the company. Mr. Hart may yet find it dangerous sport to play with edged tools, particularly if the latter are furnished by millowners.

News from the Comstock mines is of a more favorable character than heretofore reported. Seeming y reliable authorities report that rich ore is being developed in Con. Virginia, Savage, Mexican, Potosi, Bullion, Challar and two of the Gold Hill mines. While reporting that the situation is better than ever before, they do not look for much of an improvement in the share market with the mines managed as they are at present. It is now stated that the mill ring's wicked partners (the ranchmen) in the water rights of the Carson will experience a change of heart soon, and let enough water flow down the Carson to run the mills. This favorable change of heart will probably take place when the ring's dummies have frozen out, through assessments, about every outside shareholder. From the outside mines our advices are uniformly favorable. The work now going on appears to be to kill time. In several of the mines rich ore has been developed.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co, Pioneer Patent Solicitors for Pacific Coast.

FOR WEEK ENDING AUG. 9, 1892.

480,647.—QUARTZ CRUSHER—A. P. Anderson, Oriental, Nev.

480,542.—ELEVATOR—W. N. Anderson, San Rafael, Cal.

480,360.—COIN CHUTE—R. F. Avery, Spokane Falls, Wash.

480,649.—BOOK INDICATOR—Bailey & Welch, San Jose, Cal.

480,656.—TELEPHONE—J. A. Christy, S. F.

480,560.—TICKET PUNCH—A. W. Coffin, S. F.

480,569.—MEAT AND VEGETABLE CUTTER—W. R. Ellis, Woodland, Cal.

480,582.—MAILING ATTACHMENT FOR BOOKS, Etc.—C. S. Hardy, San Diego, Cal.

480,596.—EXTENSION SHOE LAST—J. H. Livermore, Port Townsend, Wash.

480,330.—KEY FASTENER—A. C. Mack, Portland, Or.

480 332.—STEAM POWER STAMP—C. A. Marlett, Portland, Or.

480 272.—IGNITER FOR GAS ENGINES—E. I. Nichols, S. F.

480,621.—OILER FOR HAND SAWS—S. Parmlee, Portland, Or.

480,625.—LEO-SPREADER FOR HORSES—J. R. Phelps, Sacramento, Cal.

480,353.—UMBRELLA RIB—W. L. Uhlenbart, Astoria, Oregon.

480 639.—VENDING MACHINE—W. Van Sant, Auburn, Cal.

480,644.—TELEGRAPH TRANSMITTER—C. Willoughby, S. F.

480 616.—LIFTING JACK—York & Austin, Clinton, Cal.

21,771.—DESIGN FOR DENTAL PUNCH—C. E. Blake Sr., S. F.

The following brief list by telegraph, for Aug. 16, will appear more complete on receipt of mail advices:

California—Hermann Baer, San Francisco, dress form; Byron Jennings, San Jose, railway railchair; Dwight Kemp, Summerfield, musical instrument; Joseph P. Magney, Oakland, sash balance; William H. Masser, Los Angeles surgical appliance; Hector McKinnon, Eureka, lumber elevator; George Merritt, San Francisco, electric train signal; Frederick W. Ruoff, San Francisco, fermenting process; Coleman Talbott, Santa Rosa, gate.

Washington—Melchi M. Grove, Garfield, pump; Charles T. Plumbtree, Spokane Falls, side reflector.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co in the shortest time possible (by mail for telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

BOOK INDICATOR.—M. G. Bailey and H. T. Welch, San Jose, assignors to James G. Spaulding, S. F. No. 480,649 Dated Aug. 9, 1892. This invention relates to that class of indicatore or marks for hooks in which an indicating strip lies transversely upon and is moved vertically over the page of the hook to indicate the lines thereof. The invention consists of a a hookmark or line indicator of this class, in which the indicating strip is made of a thin, flexible or pliant sheet of celluloid. It also consists in a connection or bearing the full width of the indicating strip, whereby said strip is mounted and slides upon its support. The object of the invention ie to provide in this class of hook indicators an indicating strip of such a character that, by reason of its pliancy and flexibility, it will lie perfectly upon the page of the book; another object is to hold the indicating strip perfectly to the support upon which it is mounted, by means of such a connection as will enable it to slide up and down upon said support easily, without cramping or binding and with precision; and also to insure, by meaos of a stiffening-eleeve, the extension of the indicator strip from its support at a right angle under all circumstances.

LEO-SPREADER FOR HORSES.—James R. Phelps, Sacramento, Cal. No. 480,625. Dated Aug. 9, 1892. This invention relates to a device for gaiting horses, and it conoists of steel or other elastic arms attached to the shafts of the vehicle or attachments thereto, said springs having a journal attachment so that the lower ends are allowed to move in conjunction with the movement of the horse's legs with which they are connected, so as to produce an outward pull thereon. The essence of the invention is contained in the arms connected with the shafts and having an elastic outward pull which is communicated to the horse's legs by connecting rigid or elastic straps. The horse's legs are spread as desired and his gait improved.

COIN-ACTUATAN VENDING MACHINE.—Wm. S. Van Sant, Auburn, Placer Co. No. 480,639. Dated Aug. 9, 1892. This invention relates to that class of machines dependent for their operation on the deposit of a coin and adapted to supply small articles of merchandise. It is especially intended for furnishing sandwiches, pieces of pie, and other articles of food, from which the device may be properly termed "a lunch-vending machine." It consists in the novel construction and arrangement of the coin-actuating tripping mechanism for releasing the drawer wherein the articles are successively deposited, whereby one may be withdrawn.

TICKET PUNCH.—Arthur W. Coffin, S. F. No. 480,560. Dated Aug. 9, 1892. Thie invention is an improvement upon patent No. 440,830, dated Nov. 18, 1890, issued to the same inventor, and it consists in certain details of construction whereby the operation of the ticket punch is rendered more convenient, accurate and safe.

MEAT AND VEGETABLE CUTTER.—Wilson R. Ellis, Woodland, Yolo Co. No. 480,569. Dated Aug. 9, 1892. This is one of that class of cutters for meat and vegetables in which rotary cutters are made to travel eccentrically over the block. The object of the invention ie to provide a meat and vege able cutter in which the cutting blades or disks shall be caneed to travel over and act upon every portion of the material.

Mining Company Elections.

THE INDEPENDENCE MINING CO. has elected the following officers: George C. Hickox, president; F. A. Berlin, vice-president, and M. A. Jackson, T. J. Shackleford and J. W. Pew, directors. J. W. Pew was reelected secretary and R. M. Caller, superintendent.

BENTON CONSOLIDATED MINING CO. Directors—John T. Hill, V. B. Allan, E. M. Morgan, Edward Howard and E. Hestres. V. B. Allan, secretary of the company, reports a balance of $44,811.69 to the credit of the company.

LADY WASHINGTON MINING CO. Directors—Monroe Thompson, S. G. Whitney, R. N. Graves, J. E. Jacobus and W. B. Englisb.

WANTED.

A position by a Mining Engineer and Metallurgist. Lead and Copper Smelting. Address Box W., this office.

FOR A NOTARY PUBLIC go to Lee D. Craig, No. 316 Montgomery St., S. F.

Assessment Notices.

GOVER MINING COMPANY. LOCATION OF PRINcipal place of business, San Francisco, California; location of works, near Drytown, Amador County, California.

Notice is hereby given that at a meeting of the Board of Directors, held on the 28th day of July, 1892, an assessment (No. 3) of Ten Cents (10c) per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Treasurer of the Company, at his office, Nos. 13 and 15 Fremont Street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on Thursday, the 1st day of September, 1892, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 26th day of September, 1892, to pay the delinquent assessment together with costs of advertising and expenses of sale.

ROBERT McF. DOBLE, Secretary.

Office—Nos. 13 and 15 Fremont Street, San Francisco, California.

WANTED.

Position as Superintendent or Metallurgist.

First class Mining Engineer and Metallurgist, several years experience in Europe, America and Mexico, is open for engagement. Graduate of one of the best mining schools in Europe. Best references. Address,

Secretary Concordia Club,
San Francisco, Cal.

WANTED.

The owner of a group of Nine Gold Veins, two of which average $30 per ton gold, wishes to give a working bond on very reasonable terms, to party who will develop the property. Wood and water convenient and abundant. Only bases in ores are iron and sulphur.

Address Box 1. PONY, Montana.

HORACE D. RANLETT,
Ores, Mining, and Commission,
420 Montgomery St., S. F.

Ships under advances to smelting works in Boston New York, Baltimore and Liverpool.
Twenty-five years' experience in Shipping Ores and Managing Mines.
Solicits Consignments of Copper Produce and Management of Mining Matters.
All business conducted on Cash Basis.
Purchase and shipment of Mining Supplies A SPECIALTY.
Sales of Developed Copper Mines undertaken.
Business Manager of UNION COPPER MINE, Copperopolis Cal.: NEWTON COPPER MINE, Amador Co., Cal.

HORACE B. GALE,
CONSULTING MECHANICAL ENGINEER,
FORMERLY
PROFESSOR OF MECHANICAL ENGINEERING
AT THE
Stanford University.
Specialties: Steam Engineering, Electric Lighting and Power Transmission.
Office: 40 California Street San Francisco.

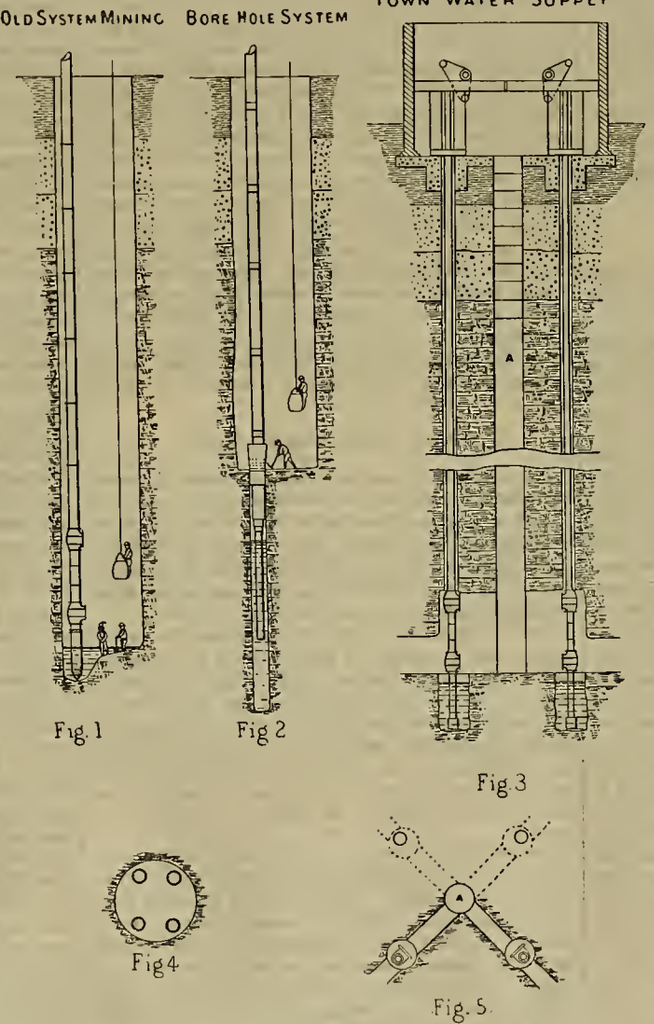
Sinking a Shaft Sump in Advance.

In sinking shafts and wells through water-beering strate in time-honored methods, there is not only great work but considereble time is taken, especially where much water is encountered. Mr. Henry Davey, of the British Association, cells ettention to a simple system of keeping down the weter in water-bearing strata in edvence of the sinking operations, so thet the excevation of the shaft (or well) mey be mede on dry ground. The ordinary method of shaft or well-sinking is to sling e pump or pumps in the shaft and to lower tbe pumps from time to time as the sinking continues; obviously tbe excavetion has to be performed in weter, end if the quantity of weter to be deelt witb is very great, e large portion of the work has to be done by the men working in e deptb of two or three feet of weter. To fecilitete the work, and to reduce the amount of water in which the men heve to work, e sump is mede under the suction pipe of the pump (shown in Fig. 1), end it is the keeping of tbis sump excavated in advance of the other work which is most difficult end tedious. Then there is the deley occasioned by the lowering of the pumps and providing the appliences necessary to the operetion.

In the plen now proposed by Mr. Devey the pump illustreted in Fig. 2 would be placed in a bore-hole mede before the commencement of the sinking of the sbeft. The only novelty in the pump is that of edepting it to the purpose. It is necessery thet debris shell not get down the bore-bole in sufficient quantity to choke it. This is provided against by meens of e heavy taper shield of cest steel, surrounding the pump and resting on the edge of the bore-hole. This shield is perforeted with holes inclined upward toward the pump to allow weter to get into the bore-hole, but to exclude debris. The shield is made very heavy, and by its own weight follows the excavetion around the pump, and also protects it from injury through blesting of the rock. The pump is made without a foot valve, and the rod of the bucket works through tbe seating of a velve which rests on the top of the working barrel. By this arrengement the drawing of the bucket also draws the valve, and should the bottom of the bore-hole be filled up with sand it can be removed by lowering a scoop such as is used in making bore-holes. The bore-hole should be bored to a greater depth thsn that required for the pump, to provide aspace for sand and debris. The application of this pump to the sinking of shafts would be veried to suit the local circumstences and the geological formation of the strata to be passed through. It would prolong the paper too much to go into all the deteils of various applications which might present themselves.



IMPROVED SYSTEM OF SHAFT AND WELL SINKING.

It is quite evident that in some situations the sheft might he obtained by means of bore-holes outside (as shown in plan in Fig. 5), and this is a plan now being carried out in procuring water for supplying towns. It is the usual and necessary prectice to provide duplicate pumping-engines, and where two engines are mede to pump from the same well, the well must be very large, so that it may accommodete two sets of pumps. Such wells are usually 12 feet to 14 diameter, and to sink them in the ordinary way is a very long and costly undertaking, especially if quicksand is met with. Moreover, on completion, it may be necessary to drive adits to increase the water supply. A simple bore-hole is made very cheaply and very expeditiously in the following manner, which is illustrated in Figs 3 and 5: Four 30 inch bore-holes can be put down in e smell fraction of the time required to sink a 12 foot well in the ordinery wey.

These bore-holes eccommodete the pumps for duplicete pumping-engines—e peir of pumpe to each engine. The bore-holes being completed, tbe pumps ere lowered and coupled up to the permanent engines, and immediately the weter found in tbe bore-holes cen be pumped end supplied to the town. Should the supply be insufficient, then e small well would be sunk in the cley to the bottom of the bore-hole pumps. The bore-holes et the level of the pumps would be connected to tbe center well, and adits driven to collect more water. Should the bore-holes yield sufficient water, then there would be no necessity to sink the well. In the section of a completed well, adits have been driven to collect additional water to that yielded by the bore-holes. When such a well is mede, the changing of the working parts of the pumps mey be done under ground, thus obviating the necessity of drawing the pump rods from the top.

THE councils of the Federated Trades of the Pacific Coast end the Building Trades are to be dissolved, and in the place of these a new joint organizetion is to be formed.

Ore Shipments by Sea.

A steemer from Le Paz has brought up 2160 tons of Mexicen silver ore from the Topia mines of the Gurney Mining end Milling Co. to the Selby Leed Works. Tbis is the second shipment from the same source, end ebout 1000 tons e month may be expected in tbe future. Formerly this ore went to tbe Coloredo smelters, and the cbange in destinetion is quite important for this Stete. The steamer on her return takes down supplies for the mines, ell purchased in this city. These sbipments are the result of sending egents down to Mexico to get the ore, a system which hes not been pursued by San Francisco men until lately. The Colorado men heve, however, been reeching out in all directions for milling ore. They heve agents permenently loceted at Mazetlsn and other Mexicen ports to hunt up end purchese ore. The San Frencisco ore-handlers and smelting men ere now seeking ore in Mexican end Central Americen ports, end doubtless this cless of business will increase from this time on. San Frencisco should reelly become e greater ore-reducing center then it is et present. Ore cen be brougbt here both by reil and sea.

The whole northwestern coest is being repidly settled up and developed, end meny mining districts ere being opened south of us. Lower Celifornia, the main Mexicen coast, Central America and South Americe, ere all large ore producers. In most of these pleces the fecilities for beneficiation of ores ere lacking end the producers prefer to sell to millmen or smelters Steemers end seiling vessels from this port visi most of the places along the greet renge of coest line mentioned, end it only requires en effort to obtain the ore trade. The Selby Smelting Co. of this city has fecilities for handling all clesses of ores in quantity, and cen do it cheaply. In fact, by getting the ore by see instead of rail, it ought to be able to do better by the miner then tbe Colorado smelters can with coest ores. These two shipments from La Paz are not only importent from a mining point of view, but are of interest to our merchants as well, since, if the bullion from the ores is produced here, the supplies for the mine will be purchesed in this city.

Profit and Grade of Ore.

In these deys it is not so much the matter of the absolute richness of ore in a mine as the quantity of it. As a general proposition, gold mines which show up ore worth $50 or $60 per ton are scarce, and the ore still scarcer. But those mines with wide ledges, even if the ore is low grade, seem to pay best. Of course, no one objects to rich ore, but quantity is an important factor. The Alaska Treadwell gold mine, Douglas Island, Alaska, during the past year yielded $707,017 in ore, worth by average milling returns only $2 95 per ton. Yet this made a cleer profitof $361,980 on their total yield. Moreover they think they now have 1,200,000 tons of ore in sight in the first and second levels. This mine is a great hill of low-grade ore, but there is plenty of it, so with a big mill and all modern appliances they make money. It is not always tbe richest ore which pays tbe biggest profit.

THE committe of the Overman Mining Co., appointed to consider the advisability of leasing or purchasing a mill, report that it would be to the interest of the stockholders to lease a mill, or if not, to purchese one.

TABLE OF CONTENTS.

ILLUSTRATION.—Improved Method of Shaft and Well Sinking, 137.
EDITORIALS.—Ore Shipments by Sea; Sinking a Shaft Sump in Advance, 137; California Mines and Eastern Capital; Miscellaneous, 138.
CORRESPONDENCE.—Shasta County Mines, 140; Origin and Functions of Humus or Decaying Vegetable Matter, 141.
MISCELLANEOUS.—A Great Camp; How Paper is Made, 140; Machine Lubricants; American Armor Plate, 141; Electrical Work in Progress; Mining Briefs; Coast Industrial Notes, 139.
MECHANICAL PROGRESS.—Ventilation of Engine and Boiler Rooms; Metal Railway Ties in Belgium; Cellulose Bottle Shells; Metal Ties Not a Success, 142.
SCIENTIFIC PROGRESS.—The Effects of an Auroral Disturbance; The Observations on Mars; A New Silver Ore; Telephotography, 142.
ELECTRICITY.—Electrical Purification of Sewage; An Eight-Foot Spark; Latest Triumph of Science; Thofehrn's Electrolytic Copper Refining Process, 144.
GOOD HEALTH.—Preservation of Eyesight; The Gospel of Good Health, 146.
USEFUL INFORMATION.—Tests for Water; The Earth's Elements; Long-Distance Transmission, 147.
MINING SUMMARY.—From the Various Counties of California, Nevada, and other Pacific States and Territories, 149–150.
MARKET REPORTS.—Eastern and Local Metal Markets; Coal and Coke; Sales in San Francisco Stock Board; Notices of Meetings, Assessments, Dividends, Etc., 150–151.

Comment.

Dry-washing machines for placer mines are nothing especially new, there having been a number of them invented from time to time. But a good one seems to be hard to obtain. On several occasions of late we have been asked where one could be found. One is in use by the McFarlin Brothers, who are mining on a bar at the mouth of Slate creek, Shasta Co., and Mr. S. M. Whitlow, of that locality, says the machine seems to be doing the work it was designed for. The coarsest gravel is taken out with a sluice fork, and the rest goes through the dry-washer. The machine resembles an old-fashioned fanning mill. Another machine of this kind is that invented by C. F. Willsie, of Salt Lake, and which is now controlled by a Salt Lake corporation. It is constructed with the object of separating flour and other fine gold from sand or concentrates in a dry state. It can be run by two-horsepower, and is said to have been successful with Snake river sand. Its capacity is said to be 100 tons of dirt per day. Another machine is that of John B. Freeman of Los Angeles, who is now at the Bluelight mine, Silverado district, Orange county. Water is scarce there, and he is using his dry-washing machine as a concentrator at the mill. The ore is first pulverized and then sent to the dry-concentrating machine, which handles five tons in 24 hours. About 15 tons of ore are reduced to one of concentrates. This is the first mill of the kind yet operated. The Freeman machine was exhibited two years ago at the Mechanics' Fair in this city, at which time it was examined by the editor of this paper, who saw it handle the material put into it in an effective manner. To do the best work, however, the material must be perfectly dry.

There are a good many miners grubbing away on the smaller camps of this and neighboring States, who have properties they want to sell or to develop, and who wonder why they are neglected and there is no inquiry for their claims. The reason is not far to seek. The miners themselves, talk among themselves, but take no trouble to inform outside people of what they have and what they are doing. Merchants who pursue this course do not sell many goods. A camp to amount to much must be advertised in some way. It takes a very short time to attract attention when a few very rich strikes are made, because things are heralded abroad and people learn something about the camp and the other mines. If our mining friends in such camps as we refer to will occasionally write us about them we shall be glad to publish their letters and help advertise the camp. It is not necessary to have experience in writing for the PRESS. All we want is the facts, and they can be put in shape for publication in this office. Mining men all over the country read the MINING AND SCIENTIFIC PRESS. They see plenty of news from the prominent mining districts, but news from the smaller camps is scarce, simply because in most of them no one takes the trouble to gather the news and send it to a mining paper.

It would be very little trouble for the Gold and Silver Extraction Co. of Denver, which owns the patent rights for the cyanide process, to put up a small working plant in the mining exhibit at the California State Fair, and demonstrate the system to the miners. The process is one which is attracting great attention in this State, and many miners have gone way up to Shasta county to see it in operation at Mr. Paul's mill. There will be a 5-stamp mill and several rotary mills running at the fair, so the ore could be readily crushed. As the process only needs certain tanks or vats after the ore is crushed, an expert manipulator could be present and demonstrate practically the whole system to all who are interested. For the miners this would be useful, as they would bring batches of their own ores and have them treated. They would see the results, and get a good idea of the method of operation of the process. The fair opens on September 5th, but little preparation would be necessary to demonstrate the process on a practical scale.

Another "long lost" placer field is supposed to have been found again. This time it is the placer originally discovered by Stewart and his partner Kit Carson, but which could never be found, though sought for diligently. A party of prospectors came into Spar City, the headquarters of Lime Creek district, Colorado, and report that 19 miles to the southwest of the Lime Creek district, and at the head of Wilson creek, they have found extensive gold placer beds which are as rich as those found by Stewart. The new find corresponds with the meager description old man Stewart gives. He has been back in the territory several times since, but was unable to identify any of the surroundings. Of course, on this report a lot of prospectors started off for the find. There is nothing like a placer discovery to excite a miner; and a second-hand find like this seems to be preferred to an original one. Dozens of such instances might be cited. Men have chased all over the country after the Peg Leg mine and the Lost Cabin and others, and they have been reported found dozens of times. But even these visionary quartz mines will not excite the prospector as much as a report of placer discoveries. The old days of California placers are remembered by all miners, and they want to be first on the ground in the wild hope of finding a second crop of rich claims.

Decay of the Stock Market.

The members of the San Francisco Stock Exchange have decided to abolish the insurance of $5000 on the life of each member, and have decided also to sell the Stock Exchange building, where their sessions are held, at a limited price of $450,000. Thirty-six votes were cast in favor of the latter proposition and 27 against it. If we remember aright, the property cost some $750,000.

It will seem strange to those who remember the days of mining-stock excitement on California and Pine streets to find the Board of Brokers even considering such questions as these. But the fact is the bottom has dropped out of the mining-stock market. For some years it has been in a languishing condition, and of late very few of the brokers are making any money. The rise or fall of securities is now represented by cents where it was formerly dollars, and prices are ridiculous as compared to those in the "'70's."

The Board of Brokers is largely to blame for this result. The fact of a mine being listed at the board was no guarantee of its reliability. "Wildcats" were as readily listed as legitimate mines, provided the requisite fees were forthcoming. Swindles of all sorts were foisted on the public, not by the brokers themselves, but by designing mining sharps, and the brokers took little or no trouble in unearthing them. So in time the public let all the stocks alone, good, bad and indifferent. The rascally transactions which have gone on in the management of the Comstock mines have only met with feeble remonstrance by the brokers if any has been made at all. The resolution to sell the building looks like the beginning of the end. That piece of property holds the members together now more than the business done in it does. Its sale will relegate stock-dealing to merited obscurity. There is little in the business now; there will be nothing then. Perhaps in that event many of the mines which have been kept going by assessments will have to be worked legitimately as mines or closed down forever. The palmy days of stock-dealing have passed in this community. Mining in these days is more of a business than a speculation; and people will no longer invest their hard-earned dollars in certificates the value of which depends on the machinations of the directors, rather than the condition of the property. With the closing of the Stock Exchange will disappear the mill rings, mining combines and merciless, dishonest gangs of operators who have brought disgrace on the mining business for 20 years past.

California Mines and Eastern Capital.

We understand that there is a movement on foot in New York having for its object the investigation of the merits of mining enterprises, and especially of mining stocks put on the market. If such a project is carried out and its management is composed of men of good mining experience, understanding the value of mines and having the facilities for ascertaining the merits of mines offered, it will be a long step toward restoring confidence in the East in mining business and in effecting the investments in mines.

New York and the eastern cities have been so frequently victimized by mining swindles that it literally "killed the goose," and in nearly every instance the promoters of these frauds were not owners of mines nor people from this coast, but sharper residents of those cities. In other words, the swindles have been in nearly every instance home productions. But the mines and the mining community have had to bear the blame for all such transactions, and in consequence it has been almost impossible to effect the sale of a mine or do any business in mines during the past few years in the East.

There is a great deal of capital lying idle awaiting investment in the East that could be profitably employed in mining, and many people owning it would be willing to invest a portion in mines; but prejudice and want of confidence prevents them from doing so. Hence if any method can be instituted whereby the tares could be winnowed from the grain, and every swindle offered be squelched in its infancy, and only really good properties be permitted to be placed in the market, it would lead to a healthy renewal of mining business. There would no longer be a general complaint as now of a want of capital to develop our mines. Especially is such a purifying element needed at this time when there seems to be a growing inquiry in the East for really good gold mines, and here is where California comes to the front as the foremost gold producer, its principal mines being those with gold ores. It seems to be the time for some concert of action between the mining interest of the coast and some organized and responsible body in the East, New York especially, to earnestly enter the field for the promotion of mining interests and mining business, and educate the present generation of capitalists to the profit and soundness of mining; as reliable, respectable and sound a business as any they are engaged in.

The fathers of the present generation of business men East had some knowledge of California and some ideas, even though vague, of mines and mining; but their sons are lamentably ignorant of everything pertaining to either this coast or its business. It is really a case for earnest missionary work, and the whole Eastern community stands sadly in need of proper information on the question of mining. Among all the other attempts to advocate and advertise the products of California, this greatest and most important of all has never had a voice lifted up in its interest.

It is to be hoped that in view of a faint indication of a disposition to look more leniently on mining investments, as is shown by the fact of quite a number of experts having been sent out to quietly look over the ground, that there will be no such exhibition of swindling enterprise as has heretofore prevailed, although, as we say, in nearly every instance it has been the man on the spot that has concocted and carried through the fraud and has simply been the promoter.

Eastern capitalists, in their want of knowledge and in their general belief that with money it is only necessary to name what they want and get it, in the way of a mine, put their standard at a figure that cannot be realized. They want such a mine as is seldom for sale. They want equipped, producing mines. The owners of such do not care to sell, for there are capitalists here as well as elsewhere who know the value of such properties and are content to hold them for the income they bring. It is only when offered more than the value that they consent to sell such mines. The Eastern capitalist wants what everybody here wants, and such as are very hard to find, and, if found, harder to purchase. What we really want of the Eastern capitalist is the money to develop properties that have as fair promise to become profitable, paying mines as those he seeks to buy at a hundred times greater price. Capital so invested is bound to win in the end, for it is but a fair estimate that if he invests in developing five mines, if one out of five proves to be a good mine, it amply repays all the outlay for the five, and is quite as likely to become a bonanza as one that has been developed and which is held at a high price.

It is therefore the aim and greatly desirable that the Eastern men should be made to see the advantages of this more reasonable course to pursue.

Electrical Work in Progress.

THE Buffalo mine in Hog canyon, Sierra county, is to he reopened, and machinery to he run by electricity will he put on and the latest processes for gold-saving will he used.

A FRANCHISE has been granted to Theodor Meetz to substitute electricity for horses on Park avenue, from the crossing of the tracks of the Central Pacific railroad to the southern boundary of Oakland.

THE franchise of the Oakland, Alameda and Piedmont Street Railway Co. has been granted to substitute electricity for horsepower on the following streets, Oakland: Webster, Water, Broadway to Seventh street.

THE ordinances granting to Davie, or Alsop, rights of way for electric roads from the Oakland water front at Harrison street to Berkeley have both been rejected hy the Oakland Council. The Davie franchise was for the system which would operate with the proposed competing ferry line.

IN the Oakland Council an ordinance has been introduced granting to George W. McNear a franchise for an electric line on Peralta street, northwest from Seventeenth street, to the limits of the city; thence from the intersection of Peralta and Horton streets along the southern boundary of Emery tract.

THOMAS HOLMAN has sold his extensive electric light and proposed power plant in Salem, Oregon, to a hig Portland syndicate. The new company will spend at least $1000,000 on this plant during the coming year. They will put in hetter and higger machinery than Mr. Holman intended The work will he pushed at once, and no expense will he spared to furnish Salem with as good a system of electric light as the country affords, and as fine a power plant.

THE Oakland City Council has granted a franchise to the East Oakland Street Railway Company along the following thoroughfares: Commencing at East Ninth street and Fourth avenue, thence along Ninth street to Seventh avenue, Tenth street Tenth avenue, Eleventh street to Thirteenth avenue; commencing on East Eighteenth street at its intersection with Thirteenth avenue, thence on East Eighteenth to the Highland Park and Fruit Vale railroad, thence northerly along the right of way of that road to East Twenty-first street, thence along that thoroughfare to its intersection with the eastern boundary line of Oakland; commencing at the intersection of Eleventh avenue and East Twenty-fourth street, thence on Eleventh avenue to East Twenty-eighth street, thence to Thirteenth avenue, and thence to Hopkins street.

DURING the past three months the North Beach and Mission Railway line has had nearly 200 men employed in laying new track along the Bryant-street branch in this city This road is completed and will he in operation with horses as a motive power during the coming week. This branch commeuces at Market and East streets and runs along the latter thoroughfare to Folsom street, thence to Second, to Bryant, and along that street to Twenty-sixth; there it diverges to Army street and thence to San Bruno road. From Bryant and Twenty-sixth streets a branch has been laid to Folsom street and along Folsom to Stoneman street. Another branch connects from the Bryant-street road to Folsom street at Eighth street. On Second street another connection has been made hetween the two routes. The new lines are all douhle-tracked and the rails used are 65-pound girder steel, the heaviest of any used in this city, Mr. Skelly states that the company will use electricity as a motive power as soon as the courts will permit them to go ahead. Then all its horses will go out of service and electricity will be used on all the lines.

WARM SPRINGS creek, Deer Lodge county, Montana, is harnessed for power already in two places, and the waters are to be utilized twice more. The Anaconda Co. has let a contract for a six-mile flume to carry the waters of the creek. When this flume shall he completed this creek will he furnishing power in four places. In two places it will furnish electric power. The water goes hack into the creek and flows down to the great smelter, where it again dashes against wheels that turn the massive machinery of the concentrators at the lower and upper works. The water again goes hack into the creek unharmed and hut little wasted. The new flume hegins at a point midway hetween Aoaconda and Cahle. It goes down the south side of the mountain to "Coyote" Brown's ranch, where the power station will be located. This station is expected to add from 900 to 1200 horsepower to the refinery. The flume will be six or seven miles long, aod from the power station the electric current will he transmitted through wires to the refinery. The water thus used is turned into Warm Springs creek again and is used to generate the electric power at the present station, ahout four miles from Anaconda. It is understood also that the Anaconda Company has located and purchased water at Race Track, and that another electric power station will he established on Race Track creek and additional power will he conducted to the refinery on six or seven miles of wire and poles.

Mining Briefs.

WORK on the Strahle slate quarry at Kelsey, El Dorado county, has been again resumed and will he carried on on a much larger scale than ever hefore.

THE directors of the Savage mine on Monday received hids for milling the ore. The matter of selecting the most advantageous bid and awarding the contract was left to Directors Wood and Miles.

THE Bay State Mining Co., Amador county, has elected the following officers: W. T. Jones, J. F. Parks, A. J. Crain, I. Kahn, J. Ballard, L. G. Griffiths, W. A. Green; treasurer, Joseph Woolford.

C. E. EDMUNDSON has sold a half interest in the Aurum mine to J. Thayer of Phœnix, A. T., for $15,000. The Aurum is a rich prospect 18 miles from Phœnix. There have been more mines sold near Phœnix in the past six weeks than in three years hefore, and there is quite a little hoom in that region.

THE Genoa *Courier* says a new placer discovery near Signal mountain, northwest of Pine Nut district, Nev., is creating considerahle excitement. Twenty-eight claims have been located.

THE Amador Queen mine was attached a few days ago for the sum of $800, claimed hy San Francisco attorneys as fees for legal advice. The owner is A. S. Cochrane of London and the charge was deemed excessive, and hence the delay in the payment.

THE higgest strike in the vicinity of Creede was made this week in the Shallow creek district on the property owned hy C. J. Roy and named "Old Judge." Roy has a lead of quartz rich in sulphurets which assays from 865 to 1530 ounces in silver.

THE North Buena Vista Oil Company of Kern county elected the following officers and directors at its annual meeting: P. Campodonico, president; G. Costa, vice-president; Charles Cuneo, legal trustee; A. Devoto, treasurer; E. Castagnetto, A. Guclici, directors; E. V. Lonigo, secretary.

THE fugitive secretary of the Bushwhacker Mining Co. of Aspen, Colorado, was arrested in this city Tuesday afternoon. His name is William B. Cochran. The company's directors examined his books several weeks ago, and found that he had overissued stock to the amount of 45,000 shares. The man has been taken back to Colorado to answer for his misdeeds.

SHERMAN PAGE of Los Angeles, one of the owners of the Senator and President gold mines in Gold Basin, A. T., arrived in Kingman, last week. It is the intention of the purchasers of this property to sink a well near the mines and have a horing outfit on the way from California with which to do the work. Should they succeed in getting a supply of water a mill will he erected immediately.

THE Anaconda Company is expending in Deer Lodge county, Mont., one million dollars in improvements to its refinery. The improvements in process of construction are the increasing of the capacity of the electrolytic copper refinery 900 tons per month; increasing the capacity of the electric power necessary to operate the refinery, and the huilding of a new converter. These are vast undertakings and will furnish employment to several hundred men.

THE nine striking miners of the Cœur d'Alene district recently punished for contempt hy the Idaho Circuit Court made a flank movement last week and attempted to escape the sentence hy means of a petition for a writ of haheas corpus addressed to the Circuit Court in this city. After due consideration Judge McKenna denied the writ. The petitioners were Thomas Eaton, John Fitzgerald, Daniel Harrington, Hugh McGee, John Nicholson, Joseph Poynton, Gus Peterson, R. Rohinson and Thomas Whalen. At present they are imprisoned in the Ada County jail of Idaho under the immediate care of Sheriff Ouldham.

Coast Industrial Notes.

RIX & BIRRELL of this city have ohtained the contract for huilding the grand market at Lima, Peru. It will he made of stone and steel and will cost from $800,000 to $1,000,000. A. Page Brown, a San Francisco architect, has completed the plans.

THE difference in the cost of working ores can be conveyed hy the statement that much of the ore sent to the smelters from Tomhstone, Arizona, pays $23 working charges while a large proportion of ore shipped from other claims is worked for $1.50 per ton. Ore running high in lead, or manganese ores clear of silica are among the latter.

A COMPANY composed of some of the principal husiness men of Healdshurg, Sonoma county, has been formed for the purpose of putting in operation the Healdshurg Flour and Feed Mills of this place. The mills are equipped with the latest improved machinery. They were formerly operated hy Streining & Shearer, but for the past two years have been lying idle.

PARTIES have leased 1000 acres of land, lying partly on the Briones Ranch and partly on the Sobrante Rancho, Contra Costa Co., from Simon Blum and G. O. Miner, and will proceed immediately to erect machinery for the purpose of horing for oil or petroleum. The parties referred to are experts in the business, and have hored many wells in the southern part of the State.

TEN immense logs, the largest ever cut in the forests near Tacoma, will he shipped to Chicago to go into the Washington World's Fair building. Each log is 122 feet long and 42 inches across at the small end. Every two logs required seven cars, 35 cars in all heing required for ten logs. One hundred and twenty-six logs will he required for the foundation of the Washington huilding.

THE branch railroad of the Southern Pacific Co. from Bakersfield to the new Kern county oil wells will he completed in a few days. The oil and asphalt from the district can then he readily marketed. A numher of townsites will he laid out along the new line. The natural wealth of Kern county in petroleum products is very great, hut the distance from main lines of rail has prevented much development.

THE purchasers of the Alameda, Oakland and Piedmont Railroad are awaiting the action of the Board of City Trustees regarding their application for additional franchises to know what to do as to a powerhouse. If any of the franchises he refused, they will not need as extensive an electric plant as they will if all are granted. The powerhouse is to be located on Webster street, where the stahles of the old horsecar line now are.

THE hoilerhouse and laundry for the Sutro haths, near the Cliff House, are advanced to the level of the second floor. The roof line of the third story will he on a level with the Cliff House road. The ground floor of the huilding contains two seventy-five horsepower hoilers, the second-floor the laundry machinery and the top apartments are for employes. The exterior of the building is to he artistic and will conform with the hathhouse and so is not of the ordinary hoilerhouse four-wall type.

EXTENSIVE improvements at the Benicia tannery, made under the supervision of the manager, Mr. J. Kullman, douhle the capacity of the institution and make it the most complete tannery on the coast. A new two-story huilding 150 hy 30 feet has been put up to contain the bark leeches or vats, and a new appliance after the manner of conveyors has been constructed to deliver the ground hark to the vats, and to also remove it therefrom, after its strength is spent, to the furnaces, where it is used for fuel. The conveyors deliver the hark from the mill to the vats by an overhead route, and remove it from underneath hy means of trap doors in the hottom of the vats. Two new harkmills and a cutter have been put in. A new two-story engine-house has also been erected, and in it has been placed a fine, large, powerful engine of 125-horsepower with a 14-foot wheel. The new engine will supplant the two small ones which formerly did the work of the institution. A short time ago a new or duplicate set of furnaces was put in and also an additional hoiler.

Personals.

U. S. SENATOR FELTON is expected back from Washington on Septemher 1st.

J. B. LYMAN, superintendent of Con. Cal. & Virginia and other mines, is in the city.

WM. SHERWOOD has been appointed instructor of chemistry at the University of California.

A. B. PIERS and A. D. Kinsley have been appointed assistants in the mechanical department of the University of California.

RAILROAD surveyors supposed to helong to the Great Northern are working southward through the mountains of Modoc county.

C. R. AYRES of Llano Station, Sonora, Mexico, is in the city with the intention of purchasing machinery to drain his mine to a depth of 600 feet.

THE new powerhouse at the Stanford University is to he commenced at once. It will he built of stone like the other structures of the quadrangle.

COL. LYONS of Churntown, Shasta county, has left for St. Louis, to confer with his partners ahout their mining interests in the East Side mining district.

CAPT. TAYLOR of San Francisco was in Redding last week. He is interested with Fred Deakin in some promising mining property in Lower Springs district.

CONGRESSMAN A. CAMINETTI, the author of the Mining Dehris hill, which passed the House hut was not considered this session in the Senate, is hack in California.

L. J. BELL, an active railroad and miniog man of Juarez, Mexico, is in the city on husiness concerning the development of the mining interests of that section of the country.

H. DESY has resigned from the mining department of the University of California, and E. A. Hearson has been appointed in his place with a salary of $1000 per annum.

COLONEL D. H. JACKSON, superintendent of the Holmes mine at Candelaria, who is ill from typhoid fever and was improving, had a relapse last week, hut is now much better.

PETER SCHERER, president of the Tellurium Gold and Silver Mining Co., has made another rich strike on the company's property on Salt creek, Shasta county, this time on the Cleveland.

JOHN BARRY is running his mill at Cerbat, A. T., and turning out large quantities of concentrates. Mr. Barry is working one of the bumping tahles and is making a success with this process.

COLEMAN BROS. of Grass Valley and others have sold to the Morning Star Mining Company of Iowa Hill, Placer county, the waterditch or canal and all the right of way in connection therewith.

PROF. HENRY CLEWS of the astronomical staff of the Lick Observatory has tendered his resignation to the regents of the State University and will leave Mount Hamilton on Septemher 1st.

IT IS understood that Albert Dihhlee will he president and Julius Bandman manager of the new Giant Powder Consolidated Co., formed hy the consolidation of the Giant Powder and Safety Nitro Companies.

C. CUMMINGS from the White Hills, A. T., reports over seventy men at work in camp and that everything is looking prosperous. The mines are developing heyond the sanguine expectations of the original locators.

C. B. WELCH, representing the Needles Reduction Co., is looking over Mohave county, A. T., in the interest of his company to ohtain some accurate information of the amount of shipping ore that can he produced here.

L. E. RICE, in the interest of a Chicago company, which is running an electro-chemical process for the reduction of ores, is at Redding, Shasta county, for the purpose of getting samples of ores from the various mines to he tested at his work.

A NEW huilding to cost $30,000 is to he put up at Palo Alto for foundry and forge work. It is to be divided into three sections; a pipe-cutting shop, an engineering and a plumhing shop at one end, occupying thirty of the 200 feet space, a hlacksmith shop in the center, occupying 94.6 feet and a foundry at the other end seventy-three feet long.

JOSEPH PORTER, who has had charge of the Gladstone mine, Shasta county, since Col. Clark took possession of the property, has gone to Siskiyou county to take charge of the Golden Dawn group of mines the Gladstone company hought of J. H. Dent. These mines are situated in the vicinity of Sawyer's Bar, in Liherty mining district. Frank Saterlee succeeds Porter at the Gladstone.

A Great Camp.

The Character of the Butte District and Extent of Its Properties.

The fame of Butte is world-wide as a mining camp, says the *Montana Mining Jonrnal*. It is impossible to describe it as it sbould be described in a newspaper article, and a large volume could not do it justice. Last year the mines of the camp produced, according to the statement of W. D. Wbeeler, assayer in cbarge of the United States assay office, in Helena, $10,931,812.09 worth of gold and silver, and $14,328,886.05 worth of copper. The total value of tbe output of the camp in gold, silver, copper and lead was $25,261,573.14, yet the Anaconda Company was closed down nine months of that time. These figures tell more than a volume of words.

Butte is situated just west of the main range of the Rocky mountains. A spur runs westerly from tbe main range, at the foot of which runs Silver Bow creek. The valley of tbe creek is about 5500 feet high, and the highest point of the spur is over 6000 feet. This is a large isolated peak, which gives the name to the camp. The average height of the spur, not including the Butte, is ahout 5800 feet.

Veins are found on both sides of the spur, running nearly east and west. On the south side, veins are found all along tbe slope to tbe creek, and on the north side fully a mile and a half from the summit of the ridge. South of the ridge, the dip of tbe vein is to the south, and on the nortb side the dip is to tbe nortb.

As far west as the Butte the country is a coarse, friable granite, occasionally assuming a hardness that defies the disintegrating forces of nature, with occasional dikes of porphyry, called rhyolite. Some persons doubt the existence of porphyry to any extent among tbe granite. The Butte is rhyolite, so far as has been explored West of the Butte the rock is called "Blue Bird granite," from a mine of that name which is found in it. This rock seems to be made up of quartz and feldspar, with little or no mica or hornblende in it. The granite east of the Butte seems to have more mica and bornblende in proportion to the quartz and feldspar.

The veins of Butte vary in size from a few inches to over a bundred feet. They are more numerous tban in any camp of whicb we have any record. As many great mines as there are in Butte, the probability is that many fully as great will yet be developed. The veins are generally well-defined, though in many instances tbe walls seem to have been mineralized at tbe same time the contents were. The walls are generally softer tban the rock some distance away, and wben miners find the rock getting softer, they expect soon to encounter a vein. The copper veins, wbich are the largest, lie almost in tbe center of the district, north and soutb, and seemingly run eastward across the valley. Good copper prospects are found in the valley, and across the valley, in line with the great leads, good prospects of copper are being found, and experts believe that some good copper mines will soon he opened up east of the creek. So far, no copper of any consequence has been found in or west of Missoula gulcb. In the northern and southern parts of tbe district the veins generally carry silver, though some of them produce a fair proportion of gold.

Silver Bow creek was once good placer ground. It would seem that near the surface, before the erosion of the spur, the veins must have carried a great deal of gold. In fact, most of the mines opened show a great deal of gold near tbe surface. As the rocks were eroded, tbe contents of the veins were carried down into the valley; but as depth is reached, silver or copper ores become the rule, though all carry more or less gold. The most common ore is a sulpburet of silver, or silver glance. Tbere is a good deal of ruhy silver, and often native silver is seen. One or two properties carry considerable lead, and zinc is found in many of them. As a general rule, the zinc ores carry but little silver, but tbere are exceptions. In tbe Gagnon and Vulcan mines zinc ores have been found that ran very high in silver.

Tbere bave been statements that the ore bodies of Butte are confined to the surface, and that with depth they become poor, and that at greater deptb they will probably he too poor to work. Tbere is no good reason for such apprehensions. Mining men know that the shoots of ore that are of equal value tbroughout their strikes and depths are phenomenal. If tbe ore of Butte showed what some ill-informed and captious people think they ought to show—equal value to the deep—then would Butte be the most interesting as well as tbe most productive camp tbat any one could hope to see. Tbere are no such ore shoots that we bave heard or read of, and no good mining man expects tbe ore shoots of Butte to show any better comparatively than the generality of veins tbe world over. The deepest sbaft in the camp is less than 1600 feet, and the explorations made give no apprebension that the veins are not permanent and tbe ore shoots not as good as have been found in the deep elsewhere. Assertions bave heen made tbat it is doubtful if any Montana mines will sbow as well at depth, hut the deepest mines of the State, so far as explored, go to disprove any such idea. Of course it cannot he known what our mines will show till the deep is reacbed and explored, but what has been done warrants furtber exploration, just as the work on the surface warranted tbe owners to go down on the veins when they were discovered. The question as to how veins were mineralized has heen brought into tbis discussion, but it cannot he supposed that the veins in our mountains were mineralized in any different manner than were the veins in other mountains of the world. But even if the veins of Butte should he proven to he too poor to work at depth, there is sufficient ore in the camp, witbin a thousand feet of the surface, to give employment to the people who are tbere or who are likely to he there, hundreds of years.

The developments on the Vulcan, which produced so much high-grade ore, have called attention, during the two years past, to the veins of the valley. The Star West is a great producer of low-grade ore, and the Ophir seems to be the making of a good mine. The Olive Branch, farther south and west, is showing up well, and gives evidence of being a paying property. Numerous prospects which have been worked in the same locality look well, and the south bids fair to equal the north of the camp in tbe production of silver, tbougb the ore is smelting instead of milling.

Tbe future of Butte is assured; the most sanguine believers in the camp are more than likely to have tbeir expectations realized, and the camp is so great that the croakers, even if heard, have no attention paid to them. No interested purchasers of Butte properties, nor paid experts, nor growlers can have any bad effects on its fortunes, and it will continue to he in the future, as in the past, tbe greatest mining camp in the world.

How Paper is Made.

In none of the mchanical arts has greater progress been made in recent years tban in the manufacture of book and magazine paper, many tons of which are used in this city every montb. Years ago, tbough not too long to endure in the memory of "the trade," the process of converting the raw material into the hard-fibred and smooth-surfaced paper essential to the needs of tbe higber class publishing houses was a task involving many days of constant care and much manual labor. To-day the process is extremely rapid, the paper is infinitely better than before, and much of the manual labor that was employed in the days of our fathers has been supplanted by tbe labyrinths of swift-moving machinery.

It would be difficut to imagine a more surprising metamorphosis tban that by whicb the native timber on the Pennsylvania hills is converted, in seven hours, to a sheet of clear, wbite paper ready for the press. Yet tbis, in brief, is the process that is going on at tbe New York and Pennsylvania Company's mill at Johnsonburg in western Pennsylvania. This mill is the largest book-paper-making establishment in the world. It covers several acres of ground and almost as many acres of machinery. Sixty cords of timber are thrust into the choppers, and 90,000 pounds of paper are shipped from tbe yards every day, to be cut, printed and placed in countless libraries throughout the land.

Tbe chopper, where the conversion of wood into paper begins, is a sort of guillotine. There is a sharp blade of massive proportions, moving swiftly in a groove. Everything that comes heneath the knife is severed. Occasionally a tough knot that has withstood the blasts of many a winter is tossed in, only to suffer tbe fate of the sapling that went before. Every stick that goes in comes out in the shape of chips no larger than a man's hand. The wood does not lose its identity, however, until the next stage of tbe process, whicb is known as "cooking." Tbere are several large digesters, containing caustic soda, in whicb tbe chopped wood is placed and cooked for five hours, this being the longest single process to which it is subjected. From the digesters it is hlown into a large tank, its consistency being thick and heavy, and its color an ugly hrown.

Tbe soda having heen run out, the pulpy-cooked wood in the tank is washed down with hot water and thoroughly cleaned. Tben it is dumped into a large chest, cleaned again, and, having been pumped into a screen which removes splinters and debris, it is run into wet machines and in a measure dried. The "stock" emerges from these macbines an unbroken sheet of light, hrown pulp, resembling soaked hirch bark. As it falls from the macbines, it is taken on carriers to four bleachers, eacb holding 4000 pounds. Here it is treated with chloride of lime liquors until tbe desired whiteness is obtained.

By this time one hegins to see how it is possible to make paper from wood, for the "stock" has already assumed a beautiful white color, and its consistency is of a soft, pulpy sort, very mucb like boiled starch and not at all like wood. Squeezed in tbe band, however, there remains a dense fibre that clearly shows the stuff of which paper is made, and establishes the link that hinds the pulp in the tank to its parent timber on the neighboring bills.

A pulsometer pump, close by the bleachers, next drives the white mass into 15 large storechests, each bolding 8000 pounds. It is held in the chests until the beating engines are ready to give it a shaking up, preparatory to its final transition. Tbe stock, wbich is now called "half-stock," here receives its coloring-material and sizing. If blue, yellow, pink or other color is desired, this is the stage in the process where the coloring-material is applied. The "sizing," wbich consists of resin and an alkali hoiled together, is used to give the paper the desired resistance to atmospheric influences. An alum is used, wbich separates the alkali from the resin in minute particles, and while passing through the calenders or the paper machines it fuses, thereby completely covering the sheet with a film, whicb effectually resists the influences of the atmosphere. Clays are used to make the paper opaque.

From the heaters the "half-stock" is passed into a large chest holding 4000 pounds, containing an agitator turning at the rate of 12 revolutions a minute, and thus keeping the stock in a uniform condition, preparatory to its passage to the refining engines. Tbese engines, two in number, supply a 106-inch paper machine, which marks tbe heginning of the end of tbe metamorphosis. Having passed through a sandcatcher to a receiver or mixing hox, the stock finds its way to tbe great Fourdrinier machines. Still in a liquid state, it is passed to an endless wire screen and a vihrator, where the water is then taken from the partially-formed paper by means of three suction pumps. Tbis screen contains 70 meshes to tbe square inch, and is 40 feet long. By the time the stock leaves the screen, its transition to the paper state is clearly defined, though there is still a long line of humming machinery through which it bas to pass. The primary stages, however, are over.

A ten-inch "dandy" roller now gives the paper the same shape and surface on hoth sides, and if necessary supplies it with the watermark. Tben it passes to two couch rolls covered witb woolen jackets, and tben to a 32-foot endless Bredt wet felt, where tbe remaining water is pretty effectually pressed out. As there is some water remaining, another felt press is resorted to, and then the paper is ready for the drying cylinders, 15 of which, each 48 inches in diameter, and heated by steam, relieve the paper of the last of its moisture. A cloud of steam rising from these cylinders, as they slowly revolve witb their white coverings, shows that some moisture still remains. But the cloud grows less and less dense as the last of the cylinders is reached, and by the time the paper reaches the calenders it is as dry as a hone.

These calenders are chilled-iron rollers, which give the paper its desired finish. From these it passes to six revolving reels and then to the cutting machines, where it is cut in any shape or size preparatory to shipment. While this interesting process is going on, the caustic soda, used in cooking the wood originally, is hy no means forgotten. This soda is somewhat expensive, and ahout 65 000 pounds of it would be lost if it were not recovered. Accordingly it is drained through the bottom of the tank, to be subjected to a remarkable series of process which eventually restore it to its original condition and to 90 per cent of its original volume.

From tbe storage tanks it is filtered through sand, and then run to a hoiler where it is heated to 170° preparatory to insertion in the Yaryan evaporating machines.

These machines may be said to have revolutionized not only the paper-making industry, but every otber industry as well in which processes similar to that of the recovery of the caustic soda are involved. The Yaryans contain 22 coils traversing tbeir entire length. The liquor enters the coils at 22 different places, and travels through eacb "effect" five times. Then it passes out into the head, drops down, and goes tbrough into the second effect, while the steam passes out. Thus, the steam arising from the hot liquors helps evaporate the liquor in the second effect, where the operation in the first effect is repeated, the steam passing around the flues and the liquor passing through tbem. By the time the third effect is reached the liquor is of the consistency of molasses, containing a very small percentage of water, and consisting for the most part of soda and resin.

After leaving the third effect it passes into a storetank and is drawn off into four "rotaries," whicb are simply revolving cylinders, eight feet in diameter, lined with firebrick. The liquor runs in at the hack of these cylinders and coats the inner surface, while a natural-gas flame at the front sets it afire. In this way the resinous substances are burned out completely, so tbat when the erstwhile liquor emerges at the front-end of the rotary it is a cberry-red asb, consisting of carbonate of soda mixed with the carhon of the burned resin. Dropping from the rotaries to an endless chain, the ash is carried up to the leacbing battery, consisting of six tanks, in which the soda is leached out of the ash by hot water.—Manufacturer and Builder.

Shasta County Mines.

SHASTA, Shasta Co., Aug. 16, 1892.

TO THE EDITOR:—Shasta county is now having a lead boom. The Bell Bros. of tbis place have a lot of lead claims honded about ten miles east of Old Furnaceville, where Mark Peck flourished in the early seventies, that are fine-looking prospects. The ores go 40 to 65 per cent lead and average 100 ounces silver per ton. It is said millions are in sight. However, it is a promising field, and development work will show up something good. Major Lyons' mine, nortb of Old Diggings, is the prize ore-producer. The major has five feet of ore that samples $400 in gold and silver. He contemplates putting up extensive works soon. The Quartz Hill mines continue to put out large quantities of good ore, and Hart's mill keeps up a steady grind. Two years have now elapsed without a stop. The large croppings just south of the Walker mines, Old Diggings, have proved a surprise to the camp within the last week. A shaft sunk 130 feet and a crosscut run 50 feet show no sign of walls. Tbe ore is liberally spattered with gold, and tbe San Francisco outfit which have it bonded for thirty thousand, figure out over a million in sight, which is certainly no overestimate. Pete Sheavers' Cleveland mine is one of the phenomenas of the district. He has a cbute of tellurium gold rock that assays from $5000 to $8000 per ton. Paul's cyanide mill is at a standstill just now.

F.

SOME important improvements, wbich will greatly increase the traveling facilities in tbe Yosemite valley and enhance its beauty, are being considered by the Yosemite Valley Commission. At the last meeting of the executive committee, Professor Lowe of Pasadena was appointed to investigate the practicability of huilding an electric road through the mountains for the transportation of tourists. Secretary Irisb states that there is abundant waterpower to run a sufficient number of dynamos to ligbt the entire valley. It is proposed to utilize part of the current for electric light purposes, and the larger and more picturesque falls are to he lit up at night in a similar manner as are the great Niagara Falls, introducing a novel feature which will prove a great attraction to travelers coming to the State.

AT the State Prison, at San Quentin, work on the new jute mill is progressing as rapidly as can he expected. Tbe walls are nearly completed. Tbe full force of prison carpenters will he put to work on it and no difficulty is anticipated in getting the entire building under cover before the first rains set in. A portion of the looms have heen received from Oakland and properly stored, and the Warden is in receipt of hills of lading from England for the spinning machinery of tbe mill, ordered through tbe Union Iron Works.

Origin and Functions of Humus or Decaying Vegetable Matter.

Translated from the German of Justus Von Liebig by Professor Granville F. Foster.

Antioch, Cal., Aug. 23, 1892.

All plants or portions of plants after the termination of life undergo one nr the other or both of two processes of decomposition, one of which is known as *fermentation*, the other as *putrefaction*, both similar processes, the latter, however, taking place nnly in materials containing albuminoids in some form.

Each nf these so far as the changes are concerned is only a slow combustion, the portions having an affinity for oxygen entering intn composition with that element during a course of days, months nr years, which process is often completed in burning in as many minutes or seconds. (It is now known that each of these two processes are developed and carried on hy appropriate micrnorganisms which cause the chemical changes for the purpose of appropriating elements necessary to their own existence.—Translator.)

The decomposition of the chief constituents of all vegetable and nf all kinds of ligneous fiber presents a phenomenon nf a peculiar kind. Surrounded with air and hence with oxygen in contact, the oxygen absorbed is converted into an equivalent volume of carbon dioxide (formerly called carbonic acid gas.) The process ceases whenever the oxygen is exhausted from the contiguous air, but is renewed whenever oxygen is again supplied. But in the case of humus, the process is not carried to the length it is in ordinary combustion, though as far as it goes it is of the nature of that combustion, for the time comes in any particular mass when the absorption of oxygen ceases even when surrounded with a plenteous supply of that gas, and the humus becomes, under ordinary circumstances, an unalterable brown or coal-hlack mass known in common parlance as mould. This then is the first and most important product in the decay of wood. It is the chief constituent of all sorts of peat and turf. By great pressure it can be reduced to hituminous coal and hy heat and pressure to anthracite. But hy contact, however, with alkalies, lime and the like, the decomposition of mould can be carried further, rendering much more carbon dioxide for growing plants.

In a soil which in its depths is accessible to the air, the action in the humus will be just like that which takes place when the mass is exposed to the air at the surface, and here as elsewhere oxygen is slowly exchanged for carbon dioxide.

Each little particle of decaying vegetable matter is surrounded with an atmosphere of carbon dioxide which it has obtained at the expense of the air on one hand, and of a part of its own weight of carhon on the other. Now, in the cultivation of the ground, *here is the philosophy* of constantly loosening up the soil for this process renders the access of air to the depths beneath free and unhindered and thus often promotes the production of carbon dioxide to an extraordinary degree

It is without doubt true that in the earliest development and growth of plants carbon dioxide is not needed. Before the development of the leaf with its cells of chlorophyll, the plant is unable to assimilate the carbon dioxide of the air. At the expense of the reserve material and the little plant germ, packed away in the seed grow the primitive organs of the new plant, the first roots and leaves (the radicle and plumule.) But once the leaves are formed then commences the assimilation of carbon dioxide.

Now remember that the matter stands thus, no plant growth can take place without either free carhon dioxide at hand or some material with this gas exhaling therefrom applied to the roots, hence, the great store of this gas in the soil from wbich the roots can draw a supply is a thing not to be undervalued. Humus promotes plant growth not then by being itself absorbed in a soluble form and thus becoming assimilated, hut because it furnishes in solution carhon dioxide, and other indispensable plant-growth-promoting elements, all of which the roots can find at hand to absorb so long as the conditions of decay, moisture and oxygen are united together in their action upon the humus.

As the carbon dioxide is passing up in the sap from the roots, there ls a considerable portion that passes to the outer air hy diffusion, and hence it is readily understood that plants, which shade with their leaves the ground as with a thick ceiling or roof overhead and hence retard or prevent the air rich in carhon dioxide beneath from heing driven away or interchanged with the outer or upper atmosphere, have a large supply of the gas to breathe in through their leaves to he here changed into carbon for the growth of the plant and into oxygen to he hreathed out into the atmosphere. Let it he remembered here that the humus contains also as a residuum of the decaying vegetahle matter, all the nitrogen the plant will need, hut even this is supplied hecause of the decomposition that goes on that chiefly supplies carhon dioxide.

Notes by the Translator. When Liehig wrote the ahove, the grand discoveries made in the domain of microorganism were all matters of the future. Not only is it now known that fermentation and putrefaction are caused hy appropriate microhes, hut that numerous diseases now generally known as zymotic, are also so caused, hence the wonderful revelations of Dr. Koch, of Berlin, and Pasteur, of France, and others who have followed these leaders, hut these discoveries in no way invalidate the description of the processes of decay or their relationship or result as stated hy Liehig. It will make no difference as to process or result to say that the oxygen of the air has a very great affinity for the carbon and hydrogen in the materials of which vegetable and animal frames are composed, and, hence after death hecause the composition of these materials is very compiex, the oxygen succeeds in easily oxygenating the carhon and hydrogen, thus npsetting the stability of the compounds which thus separates up into two or many divisions, a process known as fermentation nr putrefaction as there should happen tn be nn albuminous material or the reverse in the compound, the old view, or to say that micronrganisms or microbes in the course of their life history for the very necessity of their existence, demand certain elements in the compound which being appropriated upsets the stahility of the compound which thus separates into two nr more divisions, known as fermentation or putrefaction etc., the new view The cause has heen discovered, that is all. The earlier chemists not knowing the cause, and needing one, endowed oxygen with a sort of life, a disposition to destroy all complex organic material and set it to work to restore to the air all the gases derived from it by the processes of plant growth.

Liehig in making humus the chief source of carbon dioxide did not mean to ignore the enormous source of this gas in animal breathing, in ordinar y combustion and in many cases, in volcanic action, all of, which is absorbed from the air by the leaf. What a wonderful little laboratory do we find in the chlorophyll cells, for with the sun's ray as a chemist, and carbon dioxide as the material, carhon is made for the growth of the plant and oxygen thrown out into the air. The human chemist by much labor can separate carbon from the oxygen in this compound, but he has only the carbon for his pains, for the oxygen gnes off in affinity with some other element or if he get the oxygen, the carbon goes off with some other element. In other words, the human chemist cannot divorce carhon and oxygen without at the same time marrying one nr the other to some other element, but the sun's ray does it perfectly and yet so silently that you hear not the sound and know not how it goes on.

In Liehig's day it was helieved that plants could not assimilate free nitrogen from the air, but could get it only from ammonia or other compounds of nitrogen either in earth or air, but chiefly in the former. It is now known that nitrogen in small quantities can be assimilated by the plant directly from the air, and that various compounds of this gas, so very necessary to life of all kinds, vegetable and animal, are actually manufactured from the air. In Liebig's day it was helieved that it was only possihle to make the nitrogen of the air to unite chemically with the oxygen of the same, by passing through the air intense sparks of electricity which would thus produce minute portions of nitric acid which, brought down hy the rain would be at hand for the use of plants, but this source is very meager and does not halance the decomposition of ammonia nitrates which keep supplying the atmosphere with more nitrogen, and if this destructive work was continued the time would come when the earth, with no change in climate, would not have a supply of compounds of nitrogen sufficient for an increase in either the animal or vegetable population of the world, but the balance is kept up, the cycle is perfect.

Machine Lubricants.

Useful Hints to Engineers and Users of Machinery.

While the engineers of the present generation have realized that the question of lubricants for machinery has to be cnnsidered from a more serious point of view than obtained half a century ago, a good deal of ignorance still prevails upon the matter. Theoretically, a lubricant is simply a necessary evil, inasmuch as nearly every substance so employed has a tendency to "gum." In practice, however, lubricants are found heneficial and their excellence depends partly upon their inability to absorh oxygen and partly upon the ahsence of "gumminess" when subjected to friction. When the steam engine, and consequently the heavy machinery which its use rendered practicable, was first introduced, animal and vegetable oils were almost exclusively made use of. It was some time before it was discovered that these fats were eminently unsuitable for mechanical purposes, and the attention of power users became turned to mineral oils. Their superior penetrating powers very soon recommended them, but it was many years before engineers generally could be brought to believe that heavy "greasiness" was not the most essential characteristic of a lubricant. Vegetable and animal oils, consisting as they do of fatty acids combined with glycerine, were presently discovered to be injurious. The decomposition set up hy age released the acids, and the rancid condition then resulting was found to "eat" into metal The first step toward reform was to mix these with a certain proportion of mineral oil, whicb retarded decomposition and made them spread and penetrate better; hut even then the lubricant produced was not exactly satisfactory. A well-known American writer states truly enough that the blending of mineral and animal oils does not merely consist in shaking them together, as is supposed hy many, hut as they are of different gravity, the glohules of each must he hroken and run into each other hy agitation and heat, so that the oil will become one hody. If this he not done, the animal oil will become separated, and standing in a heated room, the had qualities will become manifest, and later, when used, the oil cannot do its work, and at once the quality is condemned. "I had a case," he continues, "where a large millowner was using oil said to he one part sperm, and three parts paraffine, of heavy gravity. The price was lower than I knew it could be made for. Upon analyzing a sample drawn from the harrel, I found it contained 60 per cent of sperm and 40 per cent of paraffine, showing that the oil was separating. The sperm oil heing lighter, was coming to the top." Such oils cannot give satisfactory results.

A writer in the *American Engineer* gives some very useful hints regarding this suhject: A good oil, he says, should he used as sparingly as the nature of the hearings will permit. The amount of resistance (friction) generated hy the hearings depends upon the numher of revolutions a minute a machine is capahle of making, and the amount of power necessary to run it. In the use of oil, uniformity of distrihution is as important as the regularity of supply. A dry spot on a bearing will at once cause heating, and if allowed tn continue, cutting will be the result. There is no department at a cnlliery more important than the engine-room. As the diminishing of friction will naturally result in gain of power, it is to the consumer's interest to learn by careful experiment the oils that are hest adapted to run his plant, and to make the necessary tests of density, fire test and viscosity. By so doing he can be certaio to receive exactly what his machine requires, and run it at the lowest possible cost. "Poor oils," says an eminent engine builder, "are a prolific source of injury, and often defeat the purpose for which a machine was intended. If a machine is not properly lubricated, it will bind, heat, and then cut, and the percentage of work added is sure to injure the engine, and certainly needs an extra dip now and tben into the coal pile."

An important point made by the writer is that no oil has been made that can economically luhricate all the journals of a mill. An oil running a heavy engine would not do to run a spindle or fast-revolving dynamo. The former runs slowly and has great pressure and strain on its journals, and consequently requires an oil that will not spread too quickly, but with low gravity and high viscosity. The latter needs a pure mineral oil, viscous and quick-spreading, to enable it to enter into the closet parts of the bearing as rapidly as the speed at which it revolves necessitates.

In making an oil for a specific purpose, the speed, power, pressure upon the journals, mode of application, and temperature at which it has to run, should be known. This information in hand, an oil can he made to suit.

The conclusion at which our contemporary's correspondent arrives is, tbat either mineral oils alone, or a mixture of mineral and animal oils, are the safest and most satisfactory for the purpose in view. The concluding paragraphs of the paper are worth the most careful attention of power users. Experiments have shown that gumming is due to the action of free acid upon the metal-bearings of machinery.

The corrosion of bearings hy oils has not received the attention it deserves, as the wear and tear of the metals and thickening of the oils has been attributed to other causes. Liquid oils corrode metals very evenly, so that the effect is not readily observed. Mineral oils contain no acid, unless they have been carelessly refined.

Mineral lubricating oil has the least action on metals; none on iron or hrass. Tallow oil has most action on iron; castor, olive and lard oils have most action on brass. Rapeseed has most action on copper.

According to experiments hy Galletry and Coleman, it was found that mineral lubricating oils diffused through textile cotton do not take fire even at a temperature at which colza oil ignites, and that fatty lubricants, to which 20 to 50 per cent of mineral oil was added, were therehy prevented from igniting.

Spon says: A mineral oil flashing below 300° is unsafe. The best oil is that which has the greatest adhesion to metallic surfaces and the least cohesion in its own particles. In this respect fine mineral oils stand first. No oil is admissible which has been purified by means of mineral acids. Mixed oil, if properly compounded, possesses the special advantages of hoth classes.—Discovery.

American Armor Plate.

The results which have been achieved in the latest tests of American armor plate must surprise even those most familiar with the work which our manufacturers and inventors have been doing along this line. Stated in brief the facts are that a 10½ inch nickle steel plate, its surface hardened by the Harvey process, received without any injury of importance the impact of five sharp-pointed chrome steel projectiles, each weighing 250 lbs., and moving at the rate of a mile in three seconds. Each of these heavy missiles struck the plate with an energy of 5,644 ft. tons, an amount of energy equal to that of a railway train of 420 tons (or say a ten-wheel locomotive and ten loaded freight cars) moving at a speed of 20 miles per hour. Yet not one of the five projectiles caused any cracks of the plate or was ahle to penetrate into it farther than about three inches, though five much lighter blows shattered similar plates less than two years ago, which were then regarded with justice as a great advance over previous practice. It would be difficult to find a more impressive illustration of the possihilities of comhined toughness and hardness which exist in modern steel. Those who still insist that steel is essentially a brittle metal should give careful consideration to the results of these tests.

It must he said that this test, taken in connection with the tests made hy the naval officers on a twin plate which showed results not so good, hut much better than anything before attained, proves more fully than any previous test has done the value of the Harvey process. This process consists of carbonizing the surface of the plate hy heating it to a high temperature in contact with charcoal and then hardening it hy a water hath This process in connection with the use of nickel, which toughens the steel and prevents its crackiog, has enahled American manufacturers within less than two years after heginning operations to produce an armor plate far superior to anything which the European manufacturers, with all their long experience, have as yet heen ahle to turn out. Certainly such achievements in metallurgy will he fruitful of results in peace as well as in war. Mr. Harvey was a prolific inventor in other directions before he turned his attention to the treatment of steel, and we hope to see him apply his process to other materials than armor plates.

The success just recoröed is another of many evidences that America is fast taking the lead of all other countries in metallurgical progress. At the present rate of advance the time is near when our manufacturers will hegin to compete successfully with those of England for the orders of foreign nations for ships of war and war materials. And until plates of similar quality to those just tested are produced in England it would seem as if the question of price would be a secondary one.—Engineering News.

Mechanical Progress.

Ventilation of Engine and Boiler Rooms.

The proper ventilation of engine and boiler rooms, though usually neglected, is a matter of great importance. The heat generated in these rooms from the combustion of the fuel, from the radiation of the furnaces, boilers, steam pipes, heaters, engines and dynamos, is intense. Furthermore, there is a smell of oil, and of escaping vapors of steam and of paint under high temperature. The detrimental effect of these conditions is felt in various ways. Heat and noxious vapors are transmitted to rooms adjoining and above the boiler and engine rooms, and are offensive to the occupants of the building. Frequently ducts which are presumed to transmit cold air to other rooms in the building pass through the engine and boiler rooms, and thus the air is heated in transit, and enters these rooms warm instead of cold, as desired, and the beneficial effect is lost. Again, in electric plants, the dynamos become inefficient when the temperature of the room is excessive. Lastly, and not least, the engineer force suffers exceedingly, which is not only annoying and detrimental to the health, but results in less efficient handling of the plant, for men cannot do their best work and look out for their employer's interests under conditions which cause them physical and mental discomfort.

Any proper system of ventilation of boiler and engine rooms, especially if the rooms are located in cellars of large buildings, requires the bringing in of fresh air to dilute and cool the atmosphere in the rooms, and requires, at the same time, the exhaust of air from these rooms. Either system alone will not answer. If air is supplied under pressure and no proper exhaust provided, it is true the room will be somewhat cooled and freshed, hut the still heated air and noxious vapors will be distributed with greater force to the rest of the building. If an exhaust system alone is used, and it is sufficiently powerfu', the heat and the noxious vapors will be partially removed and will certainly not distrihute elsewhere than in the room, but the air which will be drawn into the boiler and engine rooms will not necessarily he pure air and certainly not cold air, and thus the temperature of the room will not be sufficiently lowered and the air not be fresh enough. If one system alone is to he used, the exhaust is the hest, but neither system alone really meets the need.

The most satisfactory way of bringing in the air is to distribute it by means of galvanized-iron ducts to various portions of the room, not as is frequently practiced, by having one large inlet at one end of the room. These galvanized iron ducts should have outlets at those places where the men are principally at work, for instance, near the engine cylinders, near the dynamos, near the furnaces, and preferably, the horizontal transmitting ducts being near the ceiling, there should he funnels with registers or dampers led to a height just above the men's heads. The transmitting fresh-air ducts in the engine and boiler rooms should be well-covered with nonconducting material, for it is essential, especially in the summer time, that the air which enters the hoiler and engine rooms he pure air from without, and not of higher temperature than the external atmosphere. To create a proper circulation, the exhaust system from the boiler and engine rooms should also he arranged with corresponding outlets at the various parts of the room, these outlets connected by galvanized-iron ducts with the main exhaust flue. Thus is insured a circulation and distribution of air to all parts of the room. The galvanized iron vent-ducts do not, of course, need to he covered with nonconducting material. All the inlets and outlets should have their separate shut-off registers or dampers, so as to be easily under control of the engineer.

There can be no hetter investment for the owner of a steam and electric plant than to have the engine and hoiler rooms properly ventilated. The first cost of such an instition will bear him a handsome return in the smooth running of the plant, a greater fuel economy, in the increased comfort of the tenants, and the greater welfare of his employes.—Alfred R. Wolff, M. E., in Cassier's Magazine.

METAL RAILWAY TIES IN BELGIUM.—In connection with the recent announcement that steel ties had proved a failure on the Pennsylvania railroad lines, the latest on the matter from European authorities is quite interesting. Mr. Janssen gives in the *Revue Generale des Chemins de fer* a brief summary of the five years' experience of the Belgium railroads with metallic ties, in which the results were equally unsatisfactory. Mr. Janssen's statements are these: Two patterns of metallic ties were used, hoth of the same weight, 165 pounds, hut of somewhat different cross-section. The flange rails, weighing 76 6 pounds per yard, are fastened to the ties hy movable clips and holts and nuts. There are 12 ties to a 9-meter rail. Careful observations were made on four sections of track with metallic ties, and one section of track with half-log, creosoted, oak ties.

It was found very difficult to keep the metallic tie track in good shape, particularly as the stone ballast was ultimately pulverized by the ties, necessitating the addition of new ballast in 1891. The metallic ties are themselves in damaged condition, owing to cracks which start at the bolt holes. Out of 250 ties of each pattern which were carefully examined, 77.5 per cent of the Braet form were more or less cracked, and 17.9 per cent of the Post type were similarly damaged.

Up to the time of making this report the track with metallic ties has cost for maintenance, about 19 times as much as the track with creosoted oak ties. Beyond this, many of the metallic ties are damaged to such an extent that they must soon he removed.

Cellulose Bottle Shells.

Raw cellulose is said to be supplanting straw in the manufacture of bottle shells in France. The material is taken just as it comes from the machine—in sheets—and stamped with fairly deep indentations of oval shape and one by one-half inch in size. To form the shell, the sheet is first cut into desired size, enough being allowed to go around the bottle twice, and grasped with the hand, is passed around twice with the raised surface out, and fastened at top and hottom with metallic springs. The indentations are made so that when the cellulose is ro'led together, they do not all set into each other, hut generally upon the flat surfaces between the protuberances. The result is that great elasticity and power of resistance is afforded the shell when on the bottle, and, indeed, the latter may be thrown upon the floor upon its side without fear of breakage. It also fits the bottle tightly, and the latter will not slip out when being handled. The inventor of this device claims many advantages over the old straw shells. In the first place, it requires less room, thereby effecting a slight saving on boxes. There is less breakage. Cellulose is more durable, is a nonconductor of cold and heat, and does not decay nor become dirty and foul-smelling when moist. The shells of cellulose, it is true, cost $1.25 more per M than do the straw ones, but in the end are cheaper, as is seen by the above, and, moreover, may he worked over into new shells after being once used. The inventor of the improved shell is a Frenchman, and it is stated that he has sold the exclusive right to manufacture to a large concern at Mayence.

METAL TIES NOT A SUCCESS.—The officers of the Pennsylvania Railroad Company have come to the conclusion says the *American Manufacturer* that the metal ties which they have been experimenting with for the past 15 years are not a success, and have given orders that all that are now in use shall he taken up and the old style of wooden ones substituted. The company had metal ties placed at a number of places along the lioe, and experience has shown that it is almost impossihle to keep them in place especially on curves. They were rigid in their action, solid in their hearing, and generally got in a shaky and uneasy condition as they took a poor hold on stone ballasts. Moreover, it is asserted that wooden ties have unchanged in price for many years past. So far, wood seems naturally applicable to railroad cross-ties. It forms a cushion, deadens the sound, is cheaper than any metal or composition which has yet been found. The Pennsylvania Railroad Company has not only tried the best makes of metal ties of this country, hut imported a number from England, the best known standards in use. The standard metal tie of the London and Northwestern Railroad Company was tried, but the heavy traffic on the Pennsylvania railroad soon crushed it out of all shape.

The Reading railroad has heen experimenting with metal ties for ahout one year, but the officials of that company have not given any opinion as to the efficiency of this kind of tie in comparison with the old wooden ones. It is said, however, that the experiments on this line have ahout the same results, as the metal ties are hard to hold in line and fail to take proper hold of the hallast.

Scientific Progress.

The Effects of an Auroral Disturbance.

The New York *Sun* says that the remarkable auroral disturbance on July 16th produced curious phenomena on the telegraph circuits and instruments of submarine cables and aerial land lines that may afford data for scientific men in determining the actual nature and laws of the mysterious auroral phenomenon itself. In a hroad sense telegraphic circuits are affected hy auroral displays in the same manner as hy violent thunderstorms, but the precise effects from the two causes are very different. Interruptions to telegraphic communications on lines in far northern latitudes are of frequent occurrence. The lines in Canada, for instance, which run north of Lake Superior, from Montreal to Winnepeg, are at certain seasons of the year interrupted almost nightly hy slight auroral disturbances. But the disturbance on July 16th was the most remarkahle in its effects on telegraph circuits of any noted for a great many years, if not the greatest of all such displays. A prominent electrician in this city took careful note and tests of the effects of this disturbance, and he calculated that the force of the electrical current from the auroral disturhance was equal to 500 volts.

It is interesting to note, too, that the telegraph instruments showed the auroral disturbance to be very much greater during the day, from ahout 11 in the morning to 4 in the afternoon, our time, when there was no spectacular display of celestial scenic effects, than it was at night when the wonderful phenomenon was so apparent. The electrical disturhances were noted at precisely the same time in this city, in Chicago, and in Nova Scotia and Newfoundland. In Chicago it was noted that, while the sky was cloudless and the sun was shining hrightly, tremendous currents of electricity charged the air, completely interrupting all telegraphic communication. The currents came in waves at irregular intervals.

But the most interesting effects were noted on the delicate instruments of the Atlantic cables, and with these, on account of their peculiar construction, various phenomena of the auroral disturbance could be noted that were not possible on land-line instruments. With the latter the effect was simply to put a current or a ground on the circuit, which hroke things up generally and prevented all communication. On the cable instruments the length, intensity, and direction of the waves of electricity were recorded accurately. The effects were noted on the instruments of the cables that run into this city from Nova Scotia, and on the long cahles at Nova Scotia and Newfoundland, which run under the Atlantic to Ireland. It was on the long cables that the auroral effects were displayed most strongly, and as the cable drops directly from the office into the ocean, and lies at the bottom in some places three miles down, the presumption that the auroral force was exerted through that watery space, as well as on the instruments directly, is of interest.

The siphon recorder, the instrument used for submarine cable-telegraphing, is the most sensitive kind of galvanometer in practical use. The auroral disturbance interrupted communication entirely. During the disturhance, especially between the hours of 11 and 3 midday, the siphon or needle was deflected intermittently very strongly from the zero, or middle, position, and it swayed first to the right, and then to the left. The movement of the needle was very slow. It would suddenly move away to the left, pulled hy, say, a northerly current, and would be pulled very far, indeed, beyond the limit of any cable current, indicating that the current was very powerful. It would remain at the extreme point of deflection from 5 to 10 or 15 seconds, and then return slowly to zero. Sometimes immediately, sometimes a few seconds or minutes later, the needle would be pulled slowly in the other direction by a southerly current, would deflect to a remarkable distance, remain there a few seconds, and then return slowly to zero. That seemed to indicate that the electrical currents sent up hy the aurora were very powerful, were steady and of long duration, and alternated in direction of force in their polarity; they were like great waves of the ocean ebbing and flowing. The effect of a severe thunderstorm on a cable instrument, felt often when the storm is far at sea, is a quick, instantaneous jerk of the siphon, the effect lasting only an instant. The cahles were effected in the evening of the auroral display when the heavens were aglow with the magnificent streamers and hanners of light, hut the interruption was very slight as compared with that experienced during the day.

The Observations on Mars.

LICK OBSERVATORY, SAN JOSE, August 18.—Up to the middle of August many of the canals of Mars discovered in 1877 hy Prof. Schiaparelli were mapped here this year, but no one of them was seen to be double. On the night of August 17th Profs. Schaeberle, Campbell and Hussey made three entirely independent drawings, each of which show the canal marked Ganges on Schiaparelli's map to he distinctly double. Thus the Lick Observatory has the pleasure of confirming the discovery of Prof Schiaparelli in 1892, as it had already done by its observation of 1890.

The new star which appeared in the constellation Auriga last February faded to about the fifteenth magnitude, at least so as to be extremely faint in the great telescope. It was observed again last night by Profs. Schaeherle and Campbell and myself. It has increased in hrightness in a surprising manner, being now of about ten and one-half magnitude. Its appearance is not the same as other objects of the same brightness. Its spectrum was determined by Prof. Campbell, who finds the three hydrogen lines bright on a hackground of an exceedingly faint cnntinuous spectrum, nearly all the light heing condensed in the F line. The observations of the spectrum made during the last spring left many questions unsettled. The present observa ions will throw much light upon these and will enable us to trace something like a complete history of the remarkable change to which it has been subjected. E. S. HOLDEN.

A NEW SILVER-ORE.—Mr. H. N. Warren writes: The locality known as Broken Hill in Australia has to all interested in mining operations been recognized from an early period as a vast silver region, and the author has on numerous occasions had attention directed to such minerals as fahlerz, polyhasite, horn silver, etc., derived from the above locality, and which, from assays of the same, have proved themselves valuable metallurgical products. Besides these argentiferous formations, there are situated in the same locality immense argillaceous deposits, consisting for the most part of ordinary kaolin. These deposits have for years been regarded as a waste product, on account of the numerous hard particles of horny substance disseminated throughout their structure, thus rendering the materials unfit for porcelain or other manufacture. The mass of kaolin, so far as can he ascertained, thus remained untouched until the commencement of the present year, when it was again examined by some mineralogists, who, on applying a few physical tests, such as ascertaining the hardness of the particles, etc., at once became struck with their appearance and resemblaoce to horn silver, and being thus induced to proceed to practical tests, in so doing verified their supposed theory that the common kaolin deposits at once foreshadow one of the richest silver harvests yet to be gleaned. I have assayed quite recently a number of samples since the discovery of the same, and find in some the existence of silver iodide only, in others chloride only, and in further specimens the existence of chloride, hromide and iodide—the percentage of silver averaging from seven to ten per cent, with traces of gold; while in other cases samples weighing upward of 20 pounds in weight of pure chloride have heen ohtained.—Iron.

TELEPHOTOGRAPHY.— A young French chemist, M. Heri Courtonne, is credited by the Paris *Figaro* with a new discovery. Sound being transmissible by telephone, M. Courtonne argued, hy a rigorous analogy, that light might he transmitted too. As the telephone consists of a transmitter, a wire and a receiver, there was reason to believe that these three organs might be adopted for transmitting light vihrations, and for this purpose the transmitter and receiver should be prepared chemically for receiving and giving out light instead of sound vibrations. This was done hy substituting sensitized photographic plates for the ordinary telephone plate. One of the plates was placed in front of an aperture through which an image was cast, and this image has been forwarded by wire, and has been seen at the other end. The first apparatus was very imperfect, and M. Courtonne, having heard that Mr. Edison was on the track of a similar discovery, resolved to publish his experiments, a description of which he, however, sent in a sealed letter to the Academy in 1889. This letter is only to he opened at the owner's request. The *Figaro* says: "That the consequences of the telephotography cannot he overestimated. Tomorrow you will see in Paris the image of a man smoking in St. Petersburg."

A New and Important Book on Steam Engineering.

Le Van's Great Work on

THE INDICATOR.

The Steam Engine and the Indicator: Their Origin and Progressive Development, including the Most Recent Examples of Steam and Gas Motors, together with the Indicator, its Principles, its Utility, and its Application. By William Barnet Le Van. Illustrated by 205 engravings, chiefly of Indicator Cards. 469 pp., 8vo.

Price $4.00 by mail, free of postage to any address in the world.

CONTENTS.—I. Introduction. II. Who Invented the Steam Engine? III. Heat and Work. IV. Expansion. V. The Indicator. VI. The Action of Steam in the Cylinder of an Engine. VII. Horse Power. VIII. Diagrams Showing the Action of Steam in Steam Engine Cylinder. IX. Correct Indicator Diagrams. X. Steam Expansion Curves or Pressure of Steam in Cylinder. XI. Comparative Indicator Diagrams. XII. Steam Jackets. XIII. Varieties of Steam Engines. XIV. Gas Engines. XV. Automatic Cut-Off vs. Positive Cut-Off. XVI. Miscellaneous. Appendix. Index.

An illustrated circular of 6 pages, quarto, giving the full table of contents, with specimens of the engravings of this valuable book, will be sent free of postage to any one in any part of the world who will send us his address.

Our new revised Descriptive Catalogue of Practical and Scientific Books, 88 pages, 8vo, and our Catalogue of Books on Steam and the Steam Engine, Mechanics, Machinery, and Dynamical Engineering, and other Catalogues, the whole covering every branch of Science applied to the Arts, as well as a circular of Van Cleve's English and American Mechanic," sent free and free of postage to any one in any part of the world who will furnish his address.

MANUFACTURERS OF

ACID, ALKALINE AND WATER-PROOF PAINTS,

Superior to anything of the kind in the market for

IRON, WOOD AND TIN.

Unequaled for Submerged Timbers. Red and Brown Paints for Roofs, Warehouses, Stables, Fences, Etc., mixed Ready for Use. Also, Sheathing Paper, Portable California Mastic Roofing, the Best in the Market for

RANCH AND CITY,

AND UNEQUALED FOR

Teredo-Proof Pile Covering.

This Company also Manufactures a Malthine Compound for

RENDERING BOOTS AND SHOES WATERPROOF.

The same is a superior article for Preserving Harness rendering it Impervious to Moisture and keeping it always pliable and soft.

Send to Factory, Jefferson and First Streets, Oakland for Samples and Prices.

AMERICAN MINING AND STOCK CODE

"KELLOGRAPH."

Indispensable to the Mining Profession and Useful in all Business Transactions.

A Complete System of Transmitting Telegraphic Messages by Code Cipher Words in a Legible, Secret and Economic Manner.

OVER 35,000 WORDS AND SENTENCES

Subject to transmission under infinite complication by the use of over 70,000 code words.

No danger of publicity in telegraphing matters concerning operation or sale of mining property. The work strictly alphabetical and classified. The handiest work ever published for mining operators.

PRICE, $5. Forwarded postpaid on receipt of price by

DEWEY & CO.,

220 MARKET STREET, SAN FRANCISCO.

Electricity.

Electrical Purification of Sewage.

Dr. C. A. Burghardt recently read before an English engineering society a paper on sewage and its purification. Among other processes is mentioned an electrical process. Iron is the active agent and is derived from iron plates placed in cells through which the sewage constantly flows. One set of cells is positive and the other negative. Only the positive plate is acted upon and dissolved upon its surface, hydrated ferrous oxide oeing produced hy the action of the nascent oxygen (liherated hy the decomposition of the water at this pole) acting upon the metallic iron. This hydrated ferrous oxide (which is a solution) then acts upon the organic matter, hecoming, first, hydrated ferric oxide hy ahsorption of oxygen from the air, giving up this oxygen again to the organic matter and hecoming the lower oxide, and repeating the operation for a considerahle time until the carhonaceous matters which are oxidizable have heen oxidized, when no further reduction of the ferric hydrate can take place and it remains insoluhle and suspended in the effluent, as a yellowish precipitate. In order to cause the plates to wear off or dissolve equally, the poles are reversed on alternate days, a plate heing positive on one day and negative on ano'her day.

The electrical process has heen suhmitted to a thorough trial at Weaste from Octoher, 1891, to March, 1892, on a specified quantity of 4167 gallons per hour, or 100,000 gallons per 24 hours. The current density employed was one ampere for every seven square feet of electrode surface, or 0.4 ampere hour per gallon of treated sewage. The electric shoots or channels were constructed in four lengths—the smallest numher which would be adopted in practice. Each of the four shoots is divided into 34 cells, each cell containing 16 iron plates each two feet by one foot six inches hy one-half inch. The total weight of iron plates employed in this trial was ahout 55 tons. The plates were connected all parallel in each cell, the cells in each shoot connected in series and the four shoots parallel. The electrical energy employed was 50 amperes at a pressure of 50 volts, or a little over four induced horsepower. Each of the shoots was connected hy conductors with a distrihution hoard and suitahle switches in the engine house, in order to enahle the operator to reverse the current of any one shoot when desirahle. This reversal of the current was carried out upon one shoot at a time, the other three shoots taking temporarily the whole flow of the sewage. The poles of the shoot in question heing reversed, the cells in that shoot were short-circuited, which at once caused a very rapid discharge of the hack current. After this had taken place the current was reapplied in the opposite direction through a resistance coil, and the resistance gradually cut out as the normal electrical conditions were estahlished. The treated sewage then flows into ten setting tanks (two sets of five), each tank heing eight feet wide, 16 feet long, and ahout five feet deep. The sewage flowed constantly through one or other of the sets of five tanks, and over the intermediate walls of each tank, which were provided with douhle lips in order to assist the oxidation of the effluent. It was found that the production of wet sludge was at the rate of 17.5 tons per million gallons of sewage treated. The suspended matter is principally hydrated ferric oxide, and practically free from organic matter of an ohjectionahle character. The amount of metallic iron used is ahout three grains per gallon of treated sewage, and nearly all this is present in the sludge as hydrated ferric oxide. Experiments were carried out with this sludge, hy hurning it under proper conditions, when it was found that a red oxide of iron was ohtained which could he converted into a pigment. Possihly this pigment may he so produced in a satisfactory condition and disposed of at a price which will cover the cost of production; and thus get rid of the sludge. The suspended matter was removed hy passing the settled effluent over ordinary sand filter-beds, and it was found that the filters did not become choked at all, hut retained their efficiency from Octoher, 1891, to the end of the trial in March, 1892.

Douhtless there is a future hefore this process, and American engineers would do well to investigate it thoroughly. It seems to leave little to he desired, regarded from a scientific point of view.

AN EIGHT-FOOT SPARK.—At the recent Royal Society conversazione Mr. James Wimshurst, says *Engineering*, gave another proof of his fertility of invention hy an entirely new demonstration. He had a numher of metallized surfaces nine feet long, covered with copper, tin, hrass and other metals. At each end of such a surface he placed a Leyden jar; some of the jars were coated with tin and others with brass. When the jars were charged from one of his large machines they threw out sparks over the coated surface, the color depending on the metal employed. With hrass they were a vivid green, with tin a dazzling white. At first the sparks appeared at the edges of the jar, and as they gathered strength, radiated beyond them. Gradually they hecame like adders' tongues, darting in all directions and beating themselves on the metal surface in a futile attempt to get away to earth. At length the tension rose until the electricity found itself able to fling itself over the entire distannce from jar to jar, and the magnificent spectacle of an eight-foot spark was seen.

Latest Triumph of Science.

It is difficult to convey to the lay mind an accurate comprehension of a process so exceedingly technical, says the London *Times*, hut it may hriefly he said that Mr. Langdon Davies in the "phonophore" utilizes not the electric current hut the noises caused hy induction. The signals are transmitted hy a series of induced electric impulses, and the success of the system is found in the ahility of the inductive force to pass through insulations which electric currents cannot penetrate. A wire may he hlown down and in contact with the earth, yet so long as it is not broken it will carry a phonophoric message.

By means of the phonophore messages can be transmitted with extraordinary rapidity, and there is practically no limit to the numher of telegrams that can he sent simultaneously upon the same wire. And, as we have hinted, Mr. Langdon Davies' system is as useful telephonically as it is telegraphically. A wire which is conveying electric signals can at the same time he used for telephonic conversation without either the message or the conversation suffering in the least.

Three of the principal railway companies have already adopted the phonophore, and it must be ohvious, even to the unscientific mind, that phonophoric telegraphy and telephony, in so vastly increasing the electrician's power over the wires, have before them a very great future. The phonophore, indeed, increases almost to infinity the numher of words that can he transmitted in a given time.

THOFEHRN'S ELECTROLYTIC COPPER REFINING PROCESS.—M. Hyppolyte Fontaine's work on electrolysis gives a very full account of M. Thofehrn's process for refining copper hy electrolysis. In principle the process does not differ materially from other electrolytic methods, hut the arrangement of the parts and the general working out of the details make the method, in the opinion of M. Fontaine, a new, complete and efficient system of copper refining. In the plant at present in operation there are 120 baths in 12 series of ten each. Each hath is a little lower than the next, and the siphons are placed hetween them in order to ohtain a constant circulation. After the electrolyte has left the last of each series it goes to a collecting hasin, from which it is pumped again to the distrihuting reservoir. Baths are made of concrete. They are lined first with wood, which has heen hoiled in tar, and with sheet lead. The surface of the concrete itself is protected hy a coat of a special kind of tar. The electrolyte consists of sulphate of copper, 150 parts; sulphuric acid, 60 parts, and water, 690 parts. In order to oxidize the electrolyte and so remove the impurities which are constantly forming, jets of air are introduced into the collecting hasin and the distrihuting reservoir, and at the same time the liquid is kept at a temperature of 35° C. The rate of production of refined copper is one gramme per ampere hour, or in an average of 2½ tons per day. The average drop in potential for each hath is 1.5 volt. The difference in potential at the hinding posts of the dynamo is just sufficient to overcome the resistance of the hath and the conductors. The cost of refining copper hy this installation is $19.60 per ton. The original cost of the plant was $37,300; the stock in hand has always a value of $84,000, and the annual working expenses are $9210. The interest on capital and stock and the depreciation amount to $8130 per annum; this, together with the working expenses, is equal to $17,640.

Assessment Notices.

GOVER MINING COMPANY. LOCATION OF PRINcipal place of business, San Francisco, California; location of works, near Drytown, Amador County, California.

Notice is hereby given that at a meeting of the Board of Directors, held on the 28th day of July, 1892, an assessment (No. 3) of Ten Cents (10c) per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Treasurer of the Company, at his office, Nos. 13 and 15 Fremont Street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on Thursday, the 1st day of September, 1892, will he delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 26th day of September, 1892, to pay the delinquent assessment together with costs of advertising and expenses of sale.

ROBERT McF. DOBLE, Secretary.

Office—Nos. 13 and 15 Fremont Street, San Francisco, California.

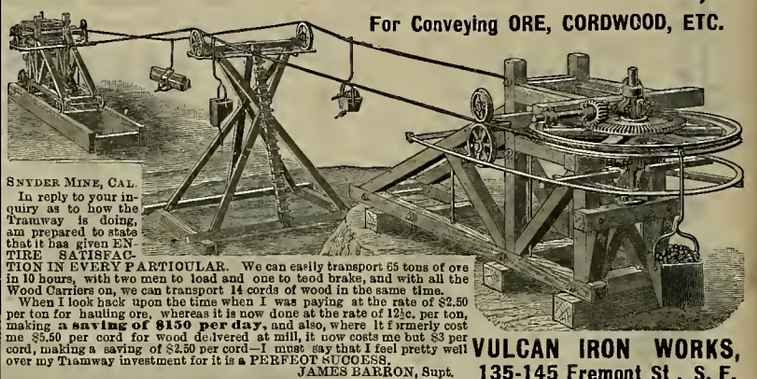
VULCAN WIRE ROPEWAY,

For Conveying ORE, CORDWOOD, ETC.



SNYDER MINE, CAL.

In reply to your inquiry as to how the Tramway is doing, am prepared to state that it has given ENTIRE SATISFACTION IN EVERY PARTICULAR. We can easily transport 65 tons of ore in 10 hours, with two men to load and one to tend brake, and with all the Wood Carriers on, we can transport 14 cords of wood in the same time.

When I look back upon the time when I was paying at the rate of $2.50 per ton for hauling ore, whereas it is now done at the rate of 12½c. per ton, making a **saving of $150 per day**, and also, where it formerly cost me $5.50 per cord for wood delivered at mill, it now costs me but $3 per cord, making a saving of $2.50 per cord—I must say that I feel pretty well over my Tramway investment for it is a PERFECT SUCCESS.

Good Health.

Preservation of Eyesight.

We have frequently in these columns, says *Optician*, given hints and advice concerning the care and preservation of the eyesight in middle life and old age. Up to the present, however, we have not pointed out that the excessive use of tobacco not only weakens the muscles of the eye, but also produces a lowering of the acuity of vision and a form of color-blindness. In fact, among the sources of the greatest trouble to the eyesight, strange as it may appear, is the chewing of tobacco. The excessive use of wine, spirits or beer, the indiscriminate administration of quinine, the use of cosmetics for heightening the luster of the eye, and mixtures for dyeing the hair and eyebrows, may also be ranked among the destroyers of vision, and there is a case on record where a diminution of vision has been traced to the wearing of an artificial wreath of flowers.

Another source of failing vision may be traced to impeded circulation. The wearing of tight neck-covering, such as collars which are too small, or shirt-bands or neckties tightly drawn, should be avoided, as they prevent the downward column of blood returning to the heart, and dilatation and development of disease is likely to follow. The same rule holds good of constriction of other parts of the body, particularly the waist. Another most serious source of eye strain is constant reading in railway carriages, which is the practice of nearly all business-men in going to and from their offices, and the injury to the eye from this cause alone is incalculable.

Nothing gives tired eyes greater relief than a green disk or square of sufficient size suspended on a direct line of vision at or against a wall on which the eyes can rest; but best of all to look upon is a green grass plot or green trees. We advance the suggestion that it would be a public boon if our magazines were printed on paper of a neutral tint, and the drop-curtains in theaters should have scenes painted on them showing great perspective. It is a rest to the eyes after the contracted effort in trying to watch the facial expression or eyes of an actor to look upon such a picture. Many theaters have drop-curtains in which perspective is absent. The result is that no relief is given the eyes after each act, and people with the least visual defect always suffer from eye strain after spending an evening in such places of amusement.

After the last epidemic of la grippe, we were particularly impressed with the large number of people complaining of the loss of power of the converging muscles of the eye. Upon investigation, we found that while these patients were confined either to bed or home, they would read incessantly. The result of this overtaxation was weakened eye muscles, and so long as they remained unsupported by lenses the patient suffered with pain over the eye region, headaches and other evidences of eye strain. Individuals suffering from any depressing disease should be as guarded as to the length of time they read or use their eyes on straining work as they are with regard to physical exertion of any kind. Fresh air and a moderate quantity of light are great essentials to good eyesight. High temperature helps to ruin people's eyes more than is generally known, while too much light, especially if it be reflected, is particularly injurious.

The Gospel of Good Health.

When the day is over, the shadows are falling and you seek your home, how do you greet the table? Do you lean back in weary exhaustion and press your hand over and over your head? Does the music of laughter jar upon your overstrained nerves, and slight noises cause you to start in fretful impatience?

If so, you are a brain-tired man, and you need physical culture to give vigor and tone to that part of your system which is so all-important as to either make or mar you. Take plenty of exercise.

The only cure for insomnia, that deadly foe of health and beauty, is physical culture. Ask Paddy the stonemason if he is troubled with a sleepless couch after running up a 40-foot ladder for ten hours, and he will stare in astonishment at the inquiry. Then, if so, imitate Paddy and walk four miles a day, or eight, if need be, until sleep will literally haunt your pillow and refuse to be driven away.

Or, on the other hand, is your manly form becoming suspiciously stout, and you yourself plethoric, short of breath—a sort of "Pickwickian" resemblance in your face and figure? Again we emphasize "physical culture" as a certain preventive against unnecessary burdens of flesh.

Should you be called upon by some emergency to endure an unusual strain, whether of body or mind, this attention to your physical needs will then prove itself an ample compensation for any little trouble or fatigue it may have entailed upon you.

Yes, physical culture is closely connected with good health good morals and longevity. It is the best improvement of our leisure, if we are following sedentary occupations.

At any rate, William Cullen Bryant practiced it until he was past 80. Gladstone today, takes his never-failing bath and sallies out to fell trees. John Ericsson, though working 15 hours a day, walked New York streets from ten o'clock P. M. until midnight for exercise.

And since God has given us bodies which demand development, lungs which cannot live without oxygen, and minds connected with both of them by subtle and manifold ties, it is our plain duty to take the necessary steps to apply these needs of our well-being.—New York Ledger.

Useful Information.

Tests for Water.

When you wish to ascertain whether water is hard or soft take a clean tube, pour about an inch of soap solution into it, then add a few drops of water, which, if hard, will turn it milky or curdy.

If you wish to see if the water is acid or alkaline, fill a tube half full of water and dip a piece of red litimus paper into it; if the paper does not turn blue it is not alkaline. Now, dip a piece of blue litimus paper in, and if the paper does not turn red the water is not acid.

If you are looking for carbonic acid, pour into the tube about an inch of water and the same quantity of lime water; if there is carbonic acid the water becomes milky, and on adding a little hydrochloric acid will become clear again.

To see if sulphate of lime, which is known as gypsum, is present, fill a test tube with about 1½ inches of water, and a little chloride of barium; if a white precipitate is formed which will not dissolve when you add a little nitric acid, the water contains gypsum.

A test for magnesia is made as follows: Fill a test tube one-third full with the water, bring it to a boil over a spirit lamp, then add a very little carbonate of ammonia and the same amount of phosphate of soda; set it aside for some moments, and if magnesia is present it will form a white precipitate.

If the test tube is one-fourth full of water, and two drops of cochineal is added, and the water turns blue instead of pink, it will denote the presence of lead.

Copper will be shown by adding a few drops of chloride of ammonium to some water in which have been placed a few filings of soft iron. If it turns blue it is an evidence of copper. Adding one drop of ferro-cyanide of potassium to a little water in a test tube will color it blue if iron is present.

A large number of other tests, of course, are made in a thorough analysis, but these are the ones which will most interest the ordinary engineer, and can be made with the least trouble or expense.—Textile World.

The Earth's Elements.

The planet, as the storehouse of material for every construction, natural or human, yields a certain number of elements. About 64 may be accepted as the number hitherto discovered, and these certainly are all that are of any mass or quantity. Out of these for structural and working use only about one-fourth are employed either by nature or by man. Nature uses largely four gases: Oxygen, nitrogen, hydrogen, chlorine. She uses also largely two inorganic, nonmetallic bodies, carbon and sulphur. She uses one metalloid, phosphorous. Man in his work uses all these elements, with some others. Nature uses iron sparingly; man uses it largely. Nature uses the metal calcium largely, letting it enter into the construction of the bone of every skeleton of animal; man uses calcium in a rough way, in the formation of buildings, in the compound form of lime, together with other metals in the grand storehouse, tin, copper, and, lately, aluminum, substances which nature shows no preference for in any of her artistic and mechanical works. Man also uses zinc, lead and mercury, for which nature has no special employment that is obvious to us.

Man uses carbon for the same purposes as nature uses it. He employs it as fuel; so does she; but he in the crude form of coal, from which, also, he produces for other purposes different useful products artistically applicable as coloring substances, in which art, as he may one day find out, he is following some undiscovered natural design. Man uses the same elementary gases as nature does, with others that she does not employ with the same intention. Both use oxygen for sustaining combustion, but nature uses it systematically for construction, which man does not, Man uses hodrogen for combustion as nature does, but not for construction. Man takes advantage of nitrogen for concentration of energy; nature takes the same advantage, by which hydrogen, though negative, becomes the most important of vital structures; but she does more, she makes nitrogen constructive as well as concentrative, an art man has not attained.—Longman's Magazine.

LONG-DISTANCE TRANSMISSION.—The results of the famous Lauffen-Frankfort transmission of power by electricity have just been issued and show some remarkable results. The distance was 109 miles, the horsepower supplied by the dynamo ranging between 78 and 197.4 horsepower. The efficiency of the dynamo fluctuated between 84.5 and 93.5 per cent, while that of the primary transformer ranged between 93.9 and 99.1 per cent. The loss in the conductor was from 3 1 to 25 5 horsepower, the efficiency of the secondary transformer fluctuating between 92.2 and 95.7 per cent. The efficiency between the turbines and the consuming apparatus ranged from 68.5 to 74.9 per cent, being below 72 per cent in only two cases. The average result of some 17 runs with what was, after all, only an experimental plant, shows an average efficiency between the turbines and the consuming apparatus of 73.3 per cent. On a shorter transmission circuit of 1¼ miles between the Palmengarten and the Frankfort Exhibition, the average efficiency of eight runs was 83.1 per cent.

Educational.

JOHN T. EVANS,
Assay Office and Chemical Laboratory,
ROOMS 46 AND 47 MONTGOMERY BLOCK, 628 Montgomery Street, San Francisco. For nearly 15 years with Thomas Price, as Chief of the Ore-Assay and Analytical Department. Lessons given in Assaying and Chemistry.

School of Practical, Civil, Mechanical, Electrical and Mining Engineering,
Surveying, Architecture, Drawing and Assaying,
723 MARKET ST., SAN FRANCISCO, CAL.
Open all year.
A. VAN DER NAILLEN, President.
Assaying of Ores, $25; Bullion and Chlorination Assay, $25; Blowpipe Assay, $10. Full Course of Assaying, $50.
ESTABLISHED 1864. Send for Circular.

WADE & WADE,
Analytical Chemists and Assayers.
ESTABLISHED 1887 — 109½ COMMERCIAL ST., LOS Angeles, Cal. We have fitted up the best laboratory in Southern California and are prepared to make Assays and Analyses of all Metals, Minerals, Ores, Waters, Fertilizers, Etc. ASSAYING TAUGHT.

ACTUAL BUSINESS PRACTICE.
Established 1863 — **PACIFIC Business College, 320 POST ST. SAN FRANCISCO.** — No Vacations.
LIFE SCHOLARSHIPS, $75.
Bookkeeping, Penmanship, Shorthand, Typewriting, English Branches, etc. Graduates aided in getting positions. Send for circulars. T. A. ROBINSON, Pres.

HEALD'S
BUSINESS COLLEGE,
24 POST ST., S. F.
FOR SEVENTY-FIVE DOLLARS THIS College instructs in Shorthand, Type Writing, Bookkeeping, Telegraphy, Penmanship, Drawing, all the English branches, and everything pertaining to business for six full months. We have sixteen teachers, and give individual instruction to all our pupils. Our school has its graduates in every part of the State.

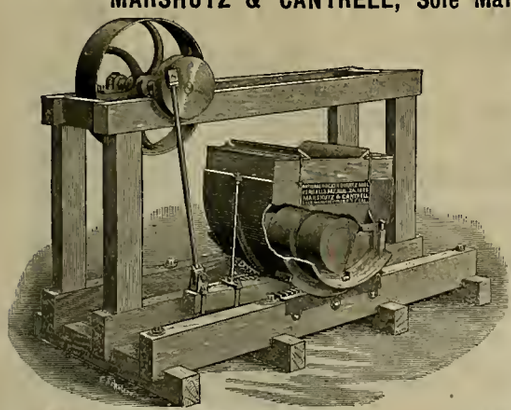
AMALGAMATING MACHINES. CASTINGS AND FORGINGS Of Every Description
ALL WORK TESTED AND GUARANTEED.
IMPROVED PORTABLE HOISTING ENGINES.

NATIONAL ROCKER QUARTZ MILL.
KENDALL'S PATENT, AUGUST 24, 1886.
CAPACITY, 12 Tons in 24 Hours. 3 H. P.
MARSHUTZ & CANTRELL, Sole Manufacturers.



The Patentee and Manufacturers cordially invite miners to critically examine and pass judgment upon this improved system of milling and amalgamating ores in the following particulars:

1. The cost is less than one-half of stamps of same capacity.
2. The freight to mine is less than one-half of stamps.
3. The cost of erecting is less than one-fourth of stamps.
4. The power to drive it is less than one-half of stamps.
5. The wear is less than one-quarter of stamps.
6. There is no wear except on shoes and dies.
7. In point of amalgamation it is superior to any other machine in use.
8. In its simplicity of construction.

We challenge competition with Stamps, Ball Pulverizers or and other ore crushing machines now before the public.

SHEET IRON PIPE

IRON PIPE
ALL SIZES, FOR GAS, STEAM AND WATER.
— WE MANUFACTURE —
SHEET IRON AND STEEL PIPE,
ALL SIZES.
For Water Supply, Mining, Irrigating Purposes, Stock Ranches, Etc.
Made in Lengths Desired from 16 to 30 feet.

This Cut shows a Section of Three Joints

DOUBLE RIVETED SHEET IRON PIPE.
In the manufacture of this Pipe, we use only a high grade of annealed Charcoal Iron of great tensile strength.
The weight or thickness of metal used, is graded according to service required, and pressure to which the Pipe will be subjected.

FOR ALL UNDERGROUND PURPOSES, we immerse the Pipe in a bath containing a special mixture of ASPHALTUM, PITCH and PETROLEUM, at a Temperature of 300° Farenheit. It thus receives a thorough coating, both inside and outside, rendering it impervious to the alkalies of the earth, rust, etc., and is practically indestructible.

CORRUGATED IRON,
Black, Painted and Galvanized, for Roof and Sides of
HAY BARNS, DRY HOUSES, STABLES, ETC.

DEWEY & CO.'S
Scientific Press

Patent Agency.
ESTABLISHED 1863.

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced, first-class Agency. We have able and trustworthy Associates and Agents in Washington and the capital cities of the principal nations of the world. In connection with our editorial, scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of Patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us often to give advice which will save inventors the expense of applying for Patents upon inventions which are not new. Circulars of advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 220 Market St. S. F.

ESTABLISHED 1866.
Pacific Chemical Works.
HENRY G. HANKS,
Practical and Industrial Chemist, Assayer and Geologist.
718 MONTGOMERY ST., - SAN FRANCISCO.

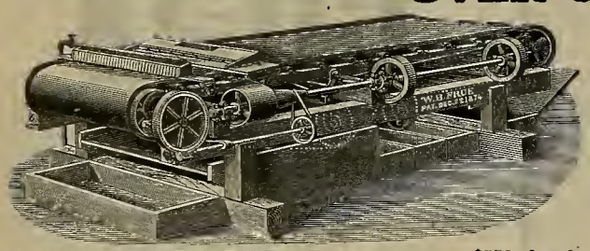
☞Will report on the condition and value of any mining property on the Pacific Coast. Rare Chemicals made to order. Instructions given in Assaying and Practical Chemistry.

DEWEY ENGRAVING COMPANY,
Engravings made from photographs, drawings and original designs, for newspaper, book, card and job printing. Engraved prints enlarged or reduced, cheaply and quickly. Also copies of manuscript, legal documents, wills, contracts, signatures, portraits, buildings, machinery and printed documents reproduced with accuracy. Photographs, stereoscopic views, etc., duplicated, enlarged or reduced. Slides for magic lanterns made from photographs lithographs, and steel or wood engravings, etc. Satisfaction guaranteed. Agents wanted in all cities and in all towns. Address, for further information, DEWEY ENGRAVING CO., 220 Market St., San Francisco.

FRUE ORE CONCENTRATOR

OVER 3200 IN ACTUAL USE.

Manufactured under Patents of April 27, 1880; September 18, 1883; July 24, 1888; and March 31, 1891.



GLADSTONE MINING COMPANY, C. J. Clark, M. E. Gen'l. Supt. FRENCH GULCH, Calaveras Co., Cal., Dec. 12, 1891.

MESSRS. ADAMS & CARTER, San Francisco, Cal.—DEAR SIRS: During my experience in mining and milling, I have used twenty-four of your four-foot Frue Vanners on different kinds of ore, both gold and silver. I have made competitive tests against them with other widely puffed-up concentrators and have always found the FRUE in first place. When I built this mill (20 stamps), I determined to put in six-foot Frues in order to save space and machinery. I am now running four of your six-foot machines and they have been going for TWELVE MONTHS. They are taking the pulp from 20 stamps, crushing a minimum of fifty tons per day, and do better work than the four-foot tables. They require no more attention than a four-foot table and handle at least twice the quantity of ore. I have run them up to 80 tons per day and could not see that they were crowded. They stop and start as easily as the smaller tables and have the advantage of double capacity with the same bearings and wearing parts, requiring no more oil, and no more wear and tear than the smaller tables. My repair account for the past six months has been too small to mention. In order to give an idea of the work they are doing here I will state that the ore has varied monthly from $5 to $20 per ton and the tailings from nothing to 60 cts. per ton. I will conclude by saying that I cannot endorse the six foot Frue Vanner too highly, and it is the only table that I would have in my mill.

C. J. CLARK, Gen'l Supt.

Price of 4-foot wide Plain Belt Frue Vanner..... $550, f. o. b.
" " " Improved Belt Frue Vanner ..... 800, f. o. b.
" 6-foot " Plain Belt Frue Vanner..... 800, f. o. b.

For any information, or for pamphlets, or for circulars or testimonials, call on or address

H. J. SUMMERHAYES, Successor to Adams & Carter, Agent for the FRUE ORE CONCENTRATOR,
No. 132 Market Street, - - San Francisco, Cal.

"TRIUMPH" ORE CONCENTRATOR WITH IMPROVED RIFFLED BELT.

(PATENTED.)

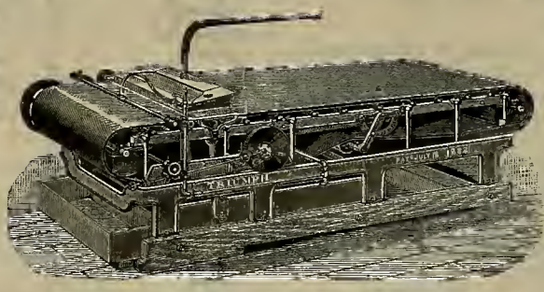
The competitive trials which have been held between the Triumph" Ore Concentrators, the "Frue" Vanners and other forms of concentrating devices, do not warrant the assertion that the "Frue" Vanner is the best ore concentrator in the market. The fact that the "Frues" have improved (corrugated) belts does not militate against the superiority of the "Triumphs;" for, when desired, they (the "Triumphs") can be mounted with a superior belt known as the "Blasdel" Riffled.

—o—

Price "Triumph" Concentrators, with Improved (Patented) Belt - - - $650 f. o. b.
Price "Triumph" Concentrators, with Plain Belt - - - - - - - $550 f. o. b.

—o—

We are prepared to guarantee the superiority of the "Triumph" over the "Frue" or any other form of Concentrator, for coin if need be. Circulars and testimonial letters furnished on application.



JOSHUA HENDY MACHINE WORKS,
39 to 51 Fremont Street, San Francisco, Cal.

Both the "Trinmph" Concentrator and "Blasdel" (riffled) Belt are protected by incontestable letters patent, granted by the Government of the United States.

Original Empire Mill and Mining Company,
Principal Office, 401 California St., cor. Sansome, S. F.
Location of Works, Grass Valley, Nevada Co., Cal.

GRASS VALLEY, NEVADA CO., CAL., Nov. 10, 1885.

Joshua Hendy Machine Works, 39 to 51 Fremont St., S. F., Cal.:

GENTLEMEN—I am pleased to state, in reference to the "Triumph" Ore Concentrators, that four (4) of them were placed in the mill of the Original Empire Mill and Mining Company in April, 1884, and a thorough test made of their practical operation; and their efficiency having been demonstrated, four (4) more were subsequently introduced as the complement of the Twenty (20) Stamp Mill, and the eight (8) have been and are now running with entirely satisfactory results.

At the Ten (10) Stamp Mill of the North Star Mining Company, under my supervision, four (4) are also in successful operation, and from my observation of their practical workings, I am convinced that this form of Concentrators is the equal, if not superior to any other style of Vanners or concentrating devices. DAVID McKAY, JR.,

Signed] Sup't North Star and Original Empire Mining Co.

N. B. When the stamping capacity of the two above named mills was increased, more "Triumph" Concentrators were purchased, and twenty-eight (28) are now in constant successful operation.

PLACER AMALGAMATORS

Combined with Steam Shovel or Dredge.

BUCYRUS SYSTEM.

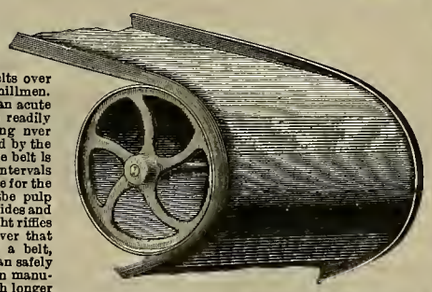
NEW METHOD OF PLACER MINING.

Saves all the Gold. Uses very little Water. Treats large quantities at Low Cost.

—BUILT SOLELY BY THE—

BUCYRUS STEAM SHOVEL AND DREDGE COMPANY,
BUCYRUS, OHIO, U. S. A.

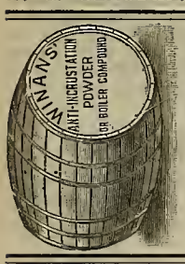
THE BLASDEL CONCENTRATING BELT COMPANY.



We have now made arrangements to have our new Improved Concentrating Belt manufactured in San Francisco. We keep always on hand Belts suitable for the Triumph and Frue machines, but can make any length or width desired. The advantages of these belts over *any others* will be readily seen by practical millmen.

First, the flanges or edges of our belt stand at an acute angle inclining toward the center, and therefore readily conform to the change of direction while passing over the end rollers; thus the vexation and loss caused by the frequent breaking of the flanges of the old style belt is practically done away with. Again, our belts, at intervals of two to four feet, have a very slight riffled surface for the space of three inches, which tends to equalize the pulp on the belt, and prevents it from banking on the sides and forming channels through the center. These slight riffles also save very fine sulphurets and the quicksilver that would otherwise escape with the tailings from a belt, the surface of which is entirely smooth. We can safely say that it is a better belt than has ever been manufactured for use on this coast. It will last much longer and will handle fully one-third more pulp than any smooth belt, and will save a higher percentage of sulphurets

H. G. BLASDEL, Jr., Manager. 419 California St., San Francisco.



WINANS' ANTI-INCRUSTATION POWDER

For Preventing and Removing the Formation of Scale in **STEAM BOILERS.** Approved by The Union Iron Works, The Risdon Iron Works, The Pacific Iron Works, the Cable Railways, many Steam Vessels and by a large number of important Factories, Foundries, Etc. BEWARE OF IMITATIONS now offered!

Mining Summary.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned

CALIFORNIA.

Amador.

THE BAY STATE MINE.—*Record*, Aug. 18: The Bay State mine lies a little over three miles north from Plymouth. The present company was organized and work inaugurated there one year ago last June. A perpendicular shaft was sunk 325 feet, including the sump of 25 feet. The company is composed largely of parties in Plymouth, who have labored in the mine in order to carry the work along and keep up their assessments. The writer visited the Bay State mine last Friday and accompanied foreman Griffith down into the bowels of the earth. From the 300-foot level a drift was run east 56 feet, and it was at this point the vein was first encountered. But it soon became manifest that they were on the wrong course to follow up the ledge, and then they came back and ran north. The first indications of the vein were found after running 45 feet, when a two-inch stringer was struck. From this point the ledge continued to rapidly increase in size, until on Friday, at the face of the tunnel, a distance of 43 feet farther, it measured a large six feet between the walls. The vein is compact, and is encased on both sides with a fine gouge and walls as solid as flint. The quartz is of a ribbon character, and prospects well in free gold and sulphurets. It is the opinion of competent judges that the rock will mill from $8 to $12 a ton. There is a considerable quantity of ore on the dump, and it is the intention to soon make a test-run in one of the mills in that vicinity. A tunnel has also been run south from the shaft 122 feet, and until the last ten feet the vein has been very well defined. It is now somewhat broken up in that quarter, but there is no cause for any worry as regards that, for north from the shaft is where the company is staking its chances, and certainly the developments made there are sufficient to warrant the belief that the Bay State mine is a notable success. Fifteen men are at present employed in the mine under the superintendency of W. T. Jones. The Bay State is the only mine now working in the vicinity of Plymouth, so our readers can readily comprehend of what importance to our neighbors is the present fine outlook at that mine.

SOUTH EUREKA MINE.—*Record*, Aug. 18: C. W. Randall, A. Haleey and D. E. Hayes, large owners in the South Eureka mine, accompanied by Mr. Fowler, a mining expert, were in Sutter Creek, Saturday and Sunday last, examining the recent strike in that mine. We are credibly informed that they are well pleased with the developments, as well as with the management of the affairs of the company by Jackson Dennis and J. F. Parks. We have authentic information that the ledge is still widening and improving in quality, and as we go to press the management is highly elated over the softness of the ground in the face of the west drift, which is a very encouraging sign. What lies in this quarter, we will probably be able to state next week. A ledge on the west is looked for. A few men were laid off at the Wildman mine this week preparatory to sinking the main shaft another hundred feet. The employes at the Belmont mine were paid off last Saturday. The large ore-hin being erected at the Hector mine is nearing completion. J. A. Fanll, the well-known mining man, has been here to investigate the new developments in some of our mines.

LINCOLN.—Tributers have resumed work at the Lincoln. It is a pity that this property is in such condition that it cannot he operated in a proper manner. It is no doubt yet a good mine, but its ownership, which is divided between a Scotch company and people in this country, is in such a tangle that nothing is done. J. A. Vanderpool of Plymouth, one of the owners in the Wabash claim, which is located in the ravine at Hubbardsville, this side of Amador City, gave us a few particulars the other day concerning the progress of work over there. The tunnel is in 180 feet, and as the vein has been encountered but a short time, it is still broken up. Some rock taken out, which did not show a particle of gold, assayed $40 and $50 a ton. A blower is to be put in soon to supply air in the mine.

Butte.

RICH STRIKE.—Oroville *Register*, Aug. 18: L. C. Paxton, superintendent of the Coleman mines at Yankee Hill, has struck rich quartz, we learn, in one of the tunnels he had recently run. The machinery for a mill has been in Oroville sometime, and it is thought, now that rich ore has been found, that the mill will at once be erected.

GRAVEL RANGE.—Oroville *Register*, Aug. 11: From D. K. Perkins we obtain the following items concerning the mines in Gravel range. Thos. R. Jones & Son are working the lower or southeastern end of a paying channel. They have completed their arrangements for work this winter and put up comfortable buildings. They have the outlet for the channel and can work to good advantage as the mine is drained by the working tunnel. The channel is from 150 to 200 feet wide, and the pay dirt from three and a half to six feet thick. They are realizing good pay from the mine. Messrs. Bracken, Gregory & Doyle have run a tunnel some 600 feet, but this was too high to strike the channel, but by sinking ten feet at the face of the tunnel they reached the pay gravel and will do well. The pay dirt is about five feet in depth and prospects excellently. The Linsy Bar Company has a large number of men at work, and Mr. Wilson, the superintendent, is confident that the owners will be richly rewarded from the mine. There are many good mines in the district, but I am only speaking of those with which I am personally acquainted. In my own mine we have run a tunnel some 400 feet long and have passed three distinct pay shoots. We have taken out about 1400 tons of ore from the vein without any stoping. This ore prospects well and gives every indication that it will mill profitably. I. R. Bullard and Mr. Tolles are engaged in hanling rock to the mill on the Perkins & Gallegher mine, and two additional teams will be employed in a few days. We will crush about 1000 tons as a test of the richness of the ore in the mine.

EXTENDS IN THIS DIRECTION.—The Blue Lead channel at Bangor extends toward Oroville, and a number of miners with whom we have lately conversed are confident that it will yet be struck near this place. J. D. Braselton, three miles east of here, is certain there are indications upon his land, and he is willing to make arrangements with any one who wants to prospect for a mine. He is confident that the Blue Lead is to be found on the hill near the Grant place, and also on the Wheeler place. Will Wheeler is down 70 odd feet, and Mr. Braselton is sanguine that a rich mine will be found there.

BUTTE CREEK.—T. W. Reece returned from the forks of Butte creek on Monday, and says things are liveing up in that section. He was surveying the Morning and Evening Star gravel mines. All the miners were at work, and it was with difficulty that he could get help enough to form a surveying party. O. M. Euslow is at work surveying in the same vicinity, and it is thought that during the fall considerable prospecting will be done. A number of San Francisco parties, including Messrs. Gilleran, Morganstein and Collins, were up examining mines in which they are interested.

Calaveras.

GRAVEL AND QUARTZ. — Mokelumne Hill *Chronicle*, Aug. 20: For the past two years mining has been at a very low ebb in this vicinity. Owing to various circumstances, "capital," as it is termed, has not sought investment in this locality, which has caused the "hard times" that everybody complains of. However, we have to chronicle a great change in this respect, for we have no less than five new enterprises started since our last report and four mines running, besides the hydraulic propositions. The old Coffee Mill mine, located in Chili Gulch mining district near the base of Golden Gate mountain, is being opened under the able management of Mr. James Gleeson. This mine has been abandoned for many years, and classed as "worked out." Mr. Gleeson has provided a substantial hoisting gear propelled by steam power, and has commenced sinking a vertical shaft in the south end of the new ground above mentioned; this shaft will bottom the channel near the head of the Bob Paul drain tunnel. When tunnel and shaft are connected, a drift will be run north on the channel and connect with the old works of the Coffee Mill, which will open and drain the entire channel from its inlet in Poorman's gulch, head of the Kremer mine, to mouth of tunnel in Bob Paul mine, a distance of 2½ miles. The old Blue Lead, located in Chili Gulch near the Junction postoffice, is again to be opened by Mr. Edward Rigney. He has a force of men at present engaged in sinking a shaft. F. J. Horswill, Esq., has assumed management of the What Cheer mine and intends sinking the shaft deeper, which will insure this property being a dividend proposition. Mr. Horswill has got control of the property, has refitted the machinery, pumped out the mine, and will at once put in power drills, sink the working shaft to a proper depth and open and work the mine profitably. We expect to soon chronicle the event of the clatter of stamps at the old What Cheer mill. Quartz prospecting is assuming healthy proportions at present. Mr. Kreeling, of the Sandy Bar Co., has bonded the Linderaxa mine, located on the Mokelumne river slope, about two miles northeast of town, which property is owned by Messrs. Tynan and Vandel. The owners had the property opened by short tunnels on the vein, and had mill tests of the property by crushing of rock packed to the Sandy Bar mill, one mile distant. These tests were satisfactory, in consequence of which the Sandy Bar Company secured control (under bond) of the claim and are engaged driving drifts and sinking shafts on the different ore bodies under the management of their superintendent, Chas. E. Crowell, Esq. This lead is a well-defined, strong fissure vein from 5 to 15 feet wide, and all indications are strong for a paying property. Work in all places has thus far developed rock satisfactory to Mr. Crowell, and the erection of a mill in the near future would be no surprise to the writer. The Mokelumne, or formerly known Leavitt mine, is a parallel lead to the Linderaxa, located about three-quarters of a mile west and is owned and operated by Joseph Davis, Esq., of San Francisco. The old veteran, Capt. Elzy, has charge of the work of development, which, of course, is going along smoothly. The necessary development work is here being done to insure the erection of a mill. A tunnel on the vein has been run through the mountain a distance of 750 feet, developing a 3½-foot vein of $6 to $7 rock. A small Huntington mill on the property has been used for testing the rock, with above results. Now a force of men is engaged in running a tunnel from the Mokelumne river level to tap the lead at the greatest possible depth. Of the mines that are working, we are pleased to state that the Quaker Mining Co. have succeeded in getting their shaft down nearly 600 feet, and are now engaged in crosscutting for the lead. The River mine, owned by Messrs. Petre & Tripp, located at the Big Bar bridge, is running in full blast. Their ten-stamp mill is engaged in crushing rock that is paying about $7 per ton. As they have a lead from 5 to 15 feet in width, it is considered high-grade rock. The rock is milled and mined at about $1 per ton. We are now credibly informed that the pay has been found on the opposite side of the lead, and that the mine shows up to be a more valuable property at present than when Mr. Petre paid $15,000 in hard cash for a one-third interest in the same. The Democrat mine, located at the head of Chili gulch, is running along as usual. The owners, Messrs. Pellston, Pfeiffer, Fisher and Wait, all four young men of our town, have erected a three-steam mill, do their own work and keep the mill bumping away on gravel that of course pays. The Horswill gravel mine, located on Stockton ridge, on ground adjoining the old Concentrator or Burleson mine on the south, is opened by an incline shaft 650 feet long on a grade of one foot in three. Gravel has been encountered, and drifting in channel is now being prosecuted. The gravel, being cemented, will not wash, but sufficient gold is being saved in the dump-box washings to warrant the further working of the mine and construction of machinery for reducing the pay gravel. Altogether the mining outlook is most encouraging. We can already notice the changed appearance of our merchants, and it is pleasing to note that we have not an idle man in town.

Los Angeles.

GLEASON MOUNTAIN CAMP.—Los Angeles *Express*, Aug. 11: Thomas Kelly, a well-known mining man, arrived in the city yesterday direct from his extensive interests on Gleason mountain, in the northern part of this county. Mr. Kelly is the owner of two of the most promising free-milling gold quartz propositions in southern California—the Padre and Bay State claims, located on the southeastern slope of the mountain, and distant about nine miles northeast of Acton station, on the Southern Pacific railway. These properties were originally located by Mr. Kelly, and ever since he has vigorously carried forward their systematic development. In conversation with the gentleman, an *Express* representative was given some interesting facts concerning at once those properties and the rapidly-growing district of Gleason mountain. Said Mr. Kelly: "I am consummating negotiations for a complete machinery plant for the Padre and Bay State mines, which I hope to arrange, shall be operated as a consolidated proposition. I propose to put up a ten-stamp mill, with all incidental equipment, and so arranged as to admit of the enlargement of the mill to 20 or 40 stamps if necessary, at comparatively slight additional cost. We have ore enough on the dumps at both mines to keep such a mill going at least for half a year, and meantime we could make the mines steadily productive. Our mill, in operation, will be the largest and most complete in southern California. Col. W. W. Hollister and banker Beckmann, of Santa Barbara, are interested with me, and I go to that city today to complete arrangements for ordering the machinery. Things in the district are looming up lustily. On the John Robarts mine a five-stamp mill will be immediately put up. Mr. Robarts having some time ago contracted for it. Another mill will go up shortly on an adjoining property, and, all working, there will be 20 stamps pounding away every hour in the day and night—quite a nucleus for a camp really not yet two years old, as far as the work of development of the prospects there is concerned. In and about the district are several hundred prospectors, and hardly a day passes that we don't hear of some important discovery. The district is an essentially free-milling gold quartz producer, and striking an average from most of the responsible assays made of gold ore from Gleason mountain, I find that $12.50 per ton is a safe estimate. This is a splendid showing for a district of the size of this. Yes, all that country up there is directly tributary to this city, and our angelic merchants want at once to keep an eye on its development and lend those prosecuting the work a helping hand. I have just left a party who owns a prospect on the mountain, who showed me a return in money of $492 for gold shipped as the result of a 12-day run with a little Mahoney pony mill of one stamp."

FRAZER MOUNTAIN MINES.—Lancaster *Gazette*, Aug. 11: In a brief review with Col. T. W. Brooks of Pomona, a mine expert of many years' experience, having examined the Frazer mining district, the *Gazette* man gleaned some facts as to the condition of the mines near Gorman station. Mr. Brooks stated that he had visited all of the important mines and mills of Frazer mountain, and, judging from the general appearance of the character and quantity of the ore, the accessibility and the special advantage of operating upon the ground, he knows no reason why, with judicious management and proper application for extracting the metal, it should not be a dividend-paying camp. The advantages from timber, water, climate, good roads, etc, are very great. At the old Frazer mine, now owned by Messrs. Spence, Bicknell, Crank and others of Los Angeles, and superintended by George Gleason, there is a grand opportunity for deep horizontal tunneling. Their ten-stamp mill will very soon be in readiness to run upon their dumps of ore, of which they have hundreds of tons of rich ore. Upon the western slope of Frazer, Mr. Brooks met Isaac Haylock, the district recorder, who, in company with his brother, showed him samples of very high-grade free-gold rock taken from different mines owned by the brothers. To the south and west of this camp, Sunnyview, he examined the White Mule mine owned by J. A. Hezlett and partner of Compton. The property is being superintended by Mr. Hazlett, who is working hard and prudently. The incline and horizontal shafts, to the depths of 100 feet, have exposed a well-defined body of gold rock. This property, like others situated upon Frazer mountain, is very advantageously situated for cheap and rapid working. The foundation for a new five-stamp having been prepared, and an expensive road built to the site, preparatory to hauling machinery on the ground, at an early date the mill is to be erected and started to work on the ore. To the south, southeast and southwest side of the mountain, work has been done in many places, showing a similar class of ore to that seen elsewhere. Mr. Brooks is very favorably impressed with the locality of the Castiac mine and mill, and was informed that it is successfully running on free-gold rock. He did not visit the mines of Captain J. H. Kolle and J. Hayes on this side of Gorman station. They have tunnels exposing gold rock for several hundred feet. The assays of the ore from this mine of Kolle & Hayes prove it to be very rich. The line of proposed railroad runs near their mines, and when that is built they expect to have some lively times there. Mr. Brooks was highly impressed with the accommodating and neighborly class of people around Gorman station. Frazer mountain reaches an altitude of 8600 feet, is comparatively oval in shape and has a great abundance of pine for fuel on the lower land and fine saw timber on the higher part of the mountain. It is surrounded with fertile valley, stock and hay ranches.

Mono.

THE BODIE CON.—*Miner*, Aug. 16: During the past week east crosscut No. 1, 700-foot level, was extended 18 feet. Upraise from No. 2 south drift, 700-foot level, was extended 13 feet. North drift, 70 feet above the 700-foot level, was extended 15 feet. East crosscut No. 1, 550-foot level, was extended 8 feet. South drift from upraise above 400-foot level was extended 5 feet.

THE MONO.—During the past week west crosscut No. 3, 700-foot level, was extended 8 feet. East crosscut No. 3, same level, was extended 6 feet. West crosscut from top of No. 1 upraise, 600-foot level, was extended 14 feet.

Orange.

SANTIAGO MINES.—*Herald*, Aug. 16: An ore-crusher and concentrator has been purchased by the Santiago Silver Mining Company and is being set up at the mines above Modjeska's ranch. With the completion of a big smelter in Los Angeles, work will doubtless be pushed on a number of Santiago mines at a good profit.

Plumas.

PORT WINE.—*Plumas Co. Bulletin*, Aug. 19: G. W. Caya, of Port Wine, made us a visit Saturday. The Happy Hollow drift mine is supposed to be nearly worked out. The company has about 30 men employed. On the same channel, about half a mile above the Happy Hollow mine, Mr. Caya's brother-in-law is opening up an important drift mine. He employs about 30 men and the mine is producing well. The prospects indicate that when fully opened this property will yield large results.

THISTLE SHAFT.—At Thistle shaft work is progressing successfully, though owing to a scarcity of water, the force of men is comparatively small. It is understood that considerable gold is being taken from the mine. This company owns several miles of the channel on which its works are located, and certainly has one of the best drift mines in the State. Of necessity, the expenses are large, thus causing much money to be scattered in that section.

GOOD RESULTS.—James Megown was down from his mine near Spanish Ranch early in the week. He lately finished some ground-sluicing on the surface of his quartz ledge, and as a result of 24 days' labor he cleaned up nearly $500. He has a good ledge of quartz, but is unable to erect a mill and otherwise improve the property. He is a man 70 years of age and feels unequal to such a task. Here is a chance for a company to purchase and develop a good property.

COPPER MINES.—The prospect of a railroad through Plumas is attracting considerable attention to the various resources of the county, especially timber and mineral. Among the mineral resources are the copper mines of Light's canyon and those in Gennesee valley. The Eagle mine, in Light's canyon, is a large deposit of copper ore of high grade, which, with good transportation facilities, such as the new railroad will furnish, would yield to operators of it handsome returns and be the means of scattering a great deal of money in the county. The same is true of the copper mines in Genesee valley. We understand that Col. Root, who was here last week, has just secured a bond on the Reward mine in Genesee valley, and he expects to interest capital in them.

GOOD PROSPECT.—Chas. Trybom, who was in town Monday, has been industriously at work on the Honeycomb quartz ledge, which is located on Eagle gulch, near the Toll Gate. He recently cut through the hanging wall and into the quartz vein. The ore body at this point is about three feet wide and prospects from $15 to $20 per ton, so Mr. Trybom claims. He showed us some very nice specimens of ore rich in gold.

Shasta.

NOTES.—Redding *Free Press*, Aug. 13: Jim Eligh and Dr. Geo. Grotefend, owners of the Banghart mine at Whiskytown, are doing quite well with the property. The Sunny Hill mines, owned by Bell Bros., will be turned over to a San Francisco company this week. It is rumored that the selling price is $50,000. Peter Sherer is negotiating for the sale of his 290 acres of land and 11 mines, including the Eureka tellurium and the Cleveland. From this latter claim he is getting some fine rock, assaying $80 to the ton. Weil & Conroy have shut down the Morton & Blis mine on Squaw creek. In conversation with Mr. Weil, he expressed great confidence in the mine and the richness of the ore, but said that the mill and apparatus to save the gold was not perfect, and that under the circumstances he did not feel justified in going to the expense necessary to make the proposition a paying one. The lead discoveries near Round mountain are creating considerable talk. The ledges show up strong and the ore assays well. These, with the coal

deposits of the locality, will make things lively ere long. Cooper & Co., the owners of certain coal lands, can, at the present time, sell out for a large figure, and the coal is called first-class by the experts sent to examine it. Jewett Scranton, superintendent for Bell Bros., brought in three sacks of fine lead ore last Wednesday evening. D. R. C. Brown, of Aspen, Colorado, the purchaser of 13 claims from R. E. Moore and Jack Strode of Whiskytown, has recently had his claims surveyed by Sam Brackins. Sam says that he surveyed one of the prettiest ledges he ever saw, rich in free gold and sulphurets. It lies vertical and straight as an arrow and is about four feet wide. The rock prospects ten cents to the pan in rusty gold. Several men are employed in developing a ledge located on Dog creek.

Trinity.

NEW RIVER.—Trinity *Journal*, Aug. 19: F. J. Ladd is getting a lot of timber on the Tough Nut mine, preparatory to starting operations. That mine has always paid well, and considerable bullion has been taken out of it. Mr. Boyd has a placer mine on Emigrant gulch where he has been sluicing all the spring and summer, and is now cleaning up. He picked up a nugget at the head of his ground sluice weighing one ounce. He expects a good cleanup.

NEVADA.

Washoe District.

CON. CAL. & VA. MINE.—Virginia *Chronicle*, Aug. 20: 1100 level—The west crosscut from the main north lateral drift, 315 feet north from the shaft station, has been advanced 30 feet; total length, 50 feet; in a porphyry and clay formation. 1500 level—From the south drift at point of connection with the old stopes we continue to extract some ore and fillings of average milling value. 1800 level—Along the south end of the drift running south from the crosscut run east from the winze No. 1, sunk from the 1750 level, we have continued to extract some ore from the sill floor upward of milling value. There has been extracted from all parts of the mine during the week 992 180-2000 tons of ore, which was shipped to the Morgan mill, the average value of which, per car samples, was $25.67 per ton. The average assay value of all the ore worked at that mill during the week, 980 tons, was $22.34 per ton, per battery samples. Bullion shipped to Carson Mint, assay value, $31,649.96.

OPHIR.—1465 level—From the south drift, 101 feet below the sill floor of the 1465 level, at a point 42 feet in from its mouth, a west crosscut No. 2 was started and has been advanced 16 feet in porphyry and quartz, carrying a low assay value.

MEXICAN.—On the 1465 level the drift running north from the crosscut run east from the bottom of the winze sunk 101 feet below the sill floor of this level, near the south boundary of the mine, at a point 40 feet east from the winze, has been advanced six feet; total length, 230 feet. From this north drift, at a point 209 feet in from its mouth, a west crosscut was started and has been advanced 12 feet, in porphyry and clay.

UNION CON.—900 level—The joint Union Con. and Sierra Nevada west drift has been extended during the week 23 feet; total length west from the joint shaft, 2323 feet. The face is in clay and porphyry.

UTAH.—340 level—From the end of the north drift (at a point 432 feet in) from the west crosscut from the shaft station, west crosscut No. 2 has been extended 25 feet; total length, 197 feet; continuing in porphyry, clay and quartz of low assay value.

SIERRA NEVADA.— The east crosscut No. 2, started 200 feet south of east crosscut No. 1, has been advanced 40 feet; total length, 146 feet; face in hard porphyry. The joint Sierra Nevada and Union west drift, 900 level, has been advanced 23 feet during the week; total distance west of shaft, 2323 feet; face in clay and porphyry.

ANDES.—East crosscut No. 1, north on 420 level, advanced 19 feet; total length, 74 feet; formation quartz.

GOULD & CURRY.—200 level: During the past week we have extracted 75 cars of ore from the old stopes on the 200 and 400 levels, the average car sample of which is $15.23 per ton. Shipped to the Occidental mill 114 tons; milled 105 tons; battery assay, $18.48. On the Sutro tunnel level the joint north drift with the Savage Company has been advanced 22 feet; total length, 520 feet. We are still easing timbers in the joint upraise.

BEST & BELCHER.—900 level: During the past week the north drift from east crosscut No. 1, 100 feet from switch, has been extended 18 feet; face in porphyry and stringers of quartz; total length, 88 feet.

HALE & NORCROSS.—We continne retimhering main shaft above 1100 level. Main Incline—Are making the necessary repairs. 1800 level: During the week advanced the north drift 25 feet; total length, 115 feet. The south drift on this level was advanced 10 feet; total length, 95 feet. The faces of these drifts are still being continued outside and east of the ledge.

CHOLLAR—Are repairing the raise from the 450 to the 500 level. Are repairing north drift, 750 level. The east crosscut, 160 feet south of north line, 920 level, is in 25 feet; face in porphyry and streaks of quartz.

POTOSI.—North drift, 120 feet east of Potosi winze, 1100 level, is out 24 feet; there are three feet of $20 quartz in the face. South drift from east crosscut, 40 feet north of Potosi winze, 1140 level, is in 20 feet; face in low-grade quartz. Potosi winze is down 471 feet below the 1500 level; bottom in quartz and porphyry. The northwest drift from the 1800 station, Ward shaft, has a total length of 740 feet; face in hard porphyry. Extracted and sent to the mill during the past week 431 1600-2000 tons of ore from the 930, 1100, 1150 and 1300 levels. Milled during the week 432 tons. On hand at mill, 76 200-2000 tone; average battery assay, $24.36; average car samnle assays, $25.21. Shipped to the Carson Mint 410 pounds of crude bullion.

WAAN COMBINATION SHAFT.—The joint Alpha and Exchequer south drift from the north line of Exchequer, 1800 level of Ward shaft, has a total length of 398 feet; face in porphyry. The joint Bullion and Potosi northwest drift from the 1800 station has a total length of 740 feet; face in hard porphyry.

ARIZONA.

THE TOMASTONE M. AND M. CO.—Tombstone *Prospector*, Aug. 11: The total expenditures of the Tombstone Mill and Mining Co. for the year ending June 30, 1892, are $396,405.90. The output from the mines worked by the company, viz., Lucky Cuss, West Side, Northwest, Toughnut, Assay Office and Charleston, aggregate 7,027.82 tons, and the yield in ounces therefrom was 460,505.74 silver and 4,207.80 ounces gold. The production of ore has exceeded that of the previous year by 2956 tons. The average grade has increased 3.90 ounces per ton in silver and declined 26 ounces per ton in gold, making the average value of the ore per ton in these metals nearly the same in two years. The percentage of lead has been nearly stationary. The increased production has come mainly from the Northwest and Tonghnut mines, hut all the mines have improved in this respect over the previous year. A very large amount of new gronnd has been opened in the mines during the year by new drifts, crosscuts, winzes and raises, aggregating 12,354 lineal feet, or 54 per cent more than the preceding year. The total number of cars of rock of all kinds hoisted was 81,515, which, together with 2182 tanks of water hoisted from the Lucky Cuss mine, amounted to 54,730 tons. Of these, only 6705 tons, or 12.4 per cent, was shipping grade and was sent to the smelter. The machinery at the different mines has been kept in good condition, and we are fortunate in being able to repeat the statement made in the last report that there have been no accidents of a serione nature during the year. 147 men are employed at present, 139 at Tombstone and eight at Charleston. Those employed directly at the mines are divided between them as follows: Lucky Cuss, 44; West Side (sulphuret), 34; Northwest, 32; Tonghnut, 33. In regard to occupation they are divided as follows: Foremen, 3; miners, 86: engineers, 7; topmen, 4; carmen, 15; ore sorters, 9; blacksmiths, 4; timber men, 3; diamond drill, 2; office, assay office and stable, 6.

OREGON.

NEW MILL.—Ashland *Tidings*, Aug. 19: The latest news from the Caven quartz mine in Siskiyou county, in which Messrs. Mullen, Kingsbury and Walters of Ashland, and Spencer of Portland, are interested, is that the mine is one of the richest now opening in this part of the country. The 10-stamp mill which was ready for business last week made a trial run of 12 hours last Saturday, and the resnlt was a cleanup of more than $100. The mill was to be started for regular work last Wednesday, and good returns are looked for. A permanent ledge five feet wide has been tapped at a depth of 60 feet in the shaft, and it improves with depth.

WASHINGTON.

THE MONTE CRISTO MINES.—Cor. Seattle *Post-Intelligencer*, Aug. 11: The Monte Cristo Mining Company's mill is now in snccessful operation and began its regular cut to-day. Its capacity is 10,000 feet per day and a heavy supply of timber is immediately at hand. The greatest difficulty was experienced in transporting the mill machinery to this point. It was shipped by water up the Skagit to Sauk City, and from there hanled by ox teams over hard mountain roade to Monte Cristo. The first cut of lnmber will be for the new hoarding-house and afterward the timbers for the concentrator. The company will at once begin the erection of a large hoarding-house for the accommodation of an increased force. Provision will be made for 100 or more men, the gangs on the upper mines having cahins in close proximity to work. Contracts for the big concentrator to be built at this point are being let and work will hegin shortly. The location determined upon is on Glacier creek, a short distance above the junction of Glacier and '75 creeks. Work will be pushed rapiöly in order that the mill may be completed hefore enow interferes. F. W. Wilmans, president of the Wilmans' Mining Company of Seattle, arrived yesterday to arrange for the opening of several more of the company's properties. Work is heing prosecnted on three promising locations, the Hopeful, Comet, and Monte Cristo. Mr. Wilmans will be engaged here for a week or more. Parsons, representing the California Wire Works (Hallidie's Company) of San Francisco, was on the ground a few days ago, fignring on the extensive tram system which is to he huilt to bring the ore from the various mines to the concentrator. A numher of miles of tramways will be reqnired.

DEVELOPING RICH PROSPECTS.— Okanogan *Outlook*, Aug. 11: That portion of the Palmer mountain district, of which the city of Golden is the commercial center, has heen the scene of great activity in the way of mining development for the last six months, and the indications are that within the next eix months this section will witness fully as much advancement as any other portion of the gold-producing districts of Okanogan county. Five months ago Golden was a log cabin village of not more than a dozen inhabitants, and hut little attention was paid to the mining interests outside of the few prospects on which the owners were able to do sometbing more than the law requires. There are two mills, with a capacity of 25 tons a day each, in successful operation and the machinery for another of the same size has been purchased and is now in transit, all of which are to he located within a radius of two miles from the town of Golden. From a deserted, prospectors' camp, comprised of ahout a dozen log cahins, a thriving little town has sprung up, as if by magic. and the Golden of to-day has a popnlation of ahont 200 inhabitants. Golden is on the eastern slope of Palmer mountain, 14 miles northeast of Loomiston and six miles southwest of Oro, the new town on the Similikameen. Tributary to it are some of the most promising gold claims in the Palmer monntain district, including such noted p operties as the Rainhow grono, the Triune and Jessie group, the Spokane, John Sherman, Richmond, the Wehe gronp and dozens of other claims of greater or less merit. The hills are full of prospectors, either looking for new discoveries or doing development work on old ones. Ths Wanicut Lake M. & M. Co., under the able and energetic management of Joseph Hanauer, has heen the principle factor in hringing this section to the front, and the successful operation of their mill has had the effect of stimulating developmeut work all around them, and also of inducing others to investigate and invest in properties that heretofore have attracted little or no attention. The company is now the sole owner of the Spokane mine. From this property it has heen getting its supply of ore for the mill. The ore is free-milling and averages from $8 to $20 a ton in gold.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR THE WEEK ENDING AUG. 16, 1892.

480,703.—DRESS FORM—H. Baer, S. F.

480,761. — ORE-CRUSHING MACHINE — E. H. Booth, S F.

480,998. — PREVENTING R. R. RAILS FROM SPREADING—J. H. Burns, Spokane, Wash.

481,013.—SLIDE VALVE—A. T. Doyle, Pendleton, Or.

481,020. — SNATCH BLOCK — A. C. French, Seattle, Wash.

481,022. — PUMP — M. M. Grove, Garfield, Wash.

481,031.— AMALGAMATING SILVER ORE — A. Janin, S. F.

481,032.—RAILWAY RAIL CHAIR—B. Jennings, San Jose, Cal.

481,035.—MUSICAL INSTRUMENT—D. Kempton, Summerland, Cal.

481,145.—SASH BALANCE—J. P. Magney, Oakland, Cal.

480,876.— CATAMENIAL APPLIANCE — W. H. Masser, Los Angeles, Cal.

480,824 —LUMBER ELEVATOR—H. McKinnon, Eureka, Cal.

481,042.—ELECTRIC TRAIN SIGNAL—Geo. Merritt, S. F.

481,043.—PUMP—E. D. Middlekauff, Stockton, Cal.

481,055.—SIDE REFLECTOR—C. E. Plumtree, Spokane, Wash.

481,061.—FERMENTING PROCESS—F. W. Rueff, S. F.

481,078.—GATE—C. Talbot, Santa Rosa, Cal.

The following brief list by telegraph, for Aug. 23, will appear more complete on receipt of mail advices:

California—George A. Adams, Santa Clara, boring and mortising machine; William S. Cranmer, Sonoma, bicycle; John Ells, Stockton, combined vise, pipe tongs and cutter; Jacob P. Engle, San Francisco, two patents, one to recover the waste products of petroleum and the other to separate the waste products of petroleum distillation; John McKellar, San Francisco, steam trap; Alexander J. Robberson, Napa, pillow-sham holder; Willlam W. Slater and H. C. Barnes, Oakland, pneumatic electric circuit controlling and interlocking apparatus; John T. Smith, San Francisco, oil-cup; Axel Warenskjold, San Diego, nut lock; James Winslow, San Francisco, roofing and siding.

Oregon—Silas P. Lowel, Eugene, washing machine.

Washington — Robert Moran, Seattle, hydraulic lifting dock.

Nevada—Arthur B. Shearer, Reno, life-saving and pleasure craft.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible (by mail for telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained throngh Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

ELECTRIC TRAIN-SIGNAL.—George Merritt, S. F. No. 481,042. Dated Aug. 16, 1892. This is one of that class of train-signals in which a signal or alarm bell is placed upon the locomotive and is operated by means of an electric circuit extending throngh the train of cars, and adapted to he opened and closed to actnate and stop the hell. The object of the invention is to provide a simple and effective train-signal which can be readily operated from or hetween any of the cars of the train and from any position in said cars, and which will operate npon the breaking apart of the train.

FERMENTING PROCESS.— Frederick R. Rueff, S. F. No. 481,061. Dated Ang. 16, 1892. In the ordinary fermenting apparatns nsed in the manufactnre of champagne, in which the fermenting germs are kept in a separate vessel, there is no provision made for removing the vessel containing the liquid heing fermented, nor is it possihle to remove the germs themselves, conseqnently the fermentation cannot be interrupted at any desired point, hut must be continued to completeness, and it ie necessary therefore to add more sugar to the liqnid being hottled. By Mr. Rueff's method, he claims to he able to arrest the fermentation at such a point as to preserve some of the original sugar, so that no more need be added. He is further enabled to draw off the fermenting germs at any time without stopping the fermentation. In the ordinary process, on account of not being able to stop the fermentation at a given point, the products are unequal in alcohol, sugar and carbonic acid, and some of the fermenting germs find their way into the hottles even with the most careful filtering. By continuous use the yeast becomes decomposed and no opportunity is afforded of drawing it off to clean the vessels. By the process patented hy Mr. Rueff, he is enahled to carry out a continuous operation; to remove the old germs of used yeast without interrupting the fermentation in the hottles; to stop the fermentation at any desired point without emptying the vessels; to produce products always equal in alcohol, sugar and carhonic acid, and to ohtain a clear liquid after a time of rest and cooling.

GATE.—Coleman Talhot, Santa Rosa, assignor of one-half to J. M. Talhot. No. 481,078. Dated Aug. 16, 1892. This is one of that class of gates pivoted horizontally at one end, whereby they swing in a vertical arc to open and close, heing actuated by suitable operating ropes, assisted by counter-halance weight. The object of the invention is to provide a simple and easily operated gate which can be opened and closed by the traveler without having to alight from his vehicle.

RAILWAY RAIL CHAIR.— Byron Jennings, San Jose, assignor of one-half to James Brusie, Oakland. No. 481,032. Dated Angust 16, 1892. The object of this invention is to provide a chair, which is fixed to the cross-ties of a railway, for the pnrpose of supporting the rail at a snitable height above the tie to allow the proper filling and paving hetween the rails and above the snrface of the ties; and the improvement consists essentially in the novel means of securing the raile to these chairs. The rail will he free to contract or elongate by changes of temperature without loosening the clamp or its key, as these parts are all locked upon the chair, while the projecting head has sufficient pressure upon the rail flange to hold it securely in place.

QUARTZ CRUSHER.—A. P. Anderson, Oriental, Esmeralda Co., Nev. No. 480,647. Dated Aug. 9, 1892. This invention consists of a short cylindrical drum having a central rib or flange and screws at the ends. Within this drum are heavy rollers, one of which is fitted upon each side of the central rih, and they are connected together by a tapering shaft passing throngh their centers and secured therein. The rih serves as a guide to keep the rollers in place as the drum rotates. Both the interior surface of the drnm and the exterior surfaces of the rollers have removahle shoes to receive the wear and the ore is discharged through the screens at the ends as fast as it is crushed fine enough. The drum is supported upon two horizontal rollers properly journaled, and power is applied to rotate the drum hy a belt passing around it from any driving pulley. The ore is fed into the ends of the drum through pipes leading from a hopper above into the center of the ends of the drum.

New Incorporations.

The following companies have heen incorporated, and papers filed in the office of the Superior Court, Department 10, San Francisco:

FORTIN BRICK CO. (Oakland). Capital stock, $240,000. Directors, V. L. Fortin, D. E. Fortin, P. Fortin, J. J. North and D. W. La Fortune.

PALERMO HOTEL CO. Capital stock, $25,000. Object, to huild a hotel at Palermo, Butte Co. Directors, C. W. McAfee, B. R. Taylor, Henry Wise, Joseph R. Folsom and C. O. Hayes.

COLUMBIAN PLUME CO. Capital stock, $25,500. Object, to deal in pampas plumes. Directors, Geo. T. Hawley, W. H. Bailey, W. E. Hale, Mrs. Harriet W. R. Strong, W. H. Chickering.

FIBRE CONCENTRATOR CO. Capital stock, $100,000. Directors, F. P. Bull, F. C. Cleary, C. C. Leavitt, L. M. Howe and W. H. Sigourney.

SIERRA IRRIGATION AND LUMBER CO. Location, Fresno Co. Capital stock, $3,000,000. Directors, Chas. L. Morrill, Albert Brown, L. J. Miller, B. F. Ellis and John Barten.

BODIE AND HAWTHORNE TELEPHONE AND TELEGRAPH CO., of Bodie, Mono Co. Capital stock, $3500. Directors, J. S. Cain, Thos. H. Leggett, John W. Kelly, N. W. Boyd, J. F. Parr, A. Graham and D. N. Carrington.

BLUE HILL MINING CO., Nevada Co. Capital stock, $150 000. Directors, W. F. Englebright, J. C. Rich, Geo. E. Turner, C. E. Mulloy and John A. Rapp.

WULFF'S MANUFACTURING CO. Capital stock, $5000. Object, to manufacture and sell mnstard, pickles, sauerkraut and other condiments. Directors, P. Wnlff, J. F. Schomer, W. D. Meyer, Henry A. von der Nienburg, John Knubel, John N. Meyer, Henry Schulken.

SUMMIT LAKE CANAL CO. Capital stock, $5,000,000. To do business in Fresno, Merced and Stanislaus connties Directors, T. J. Parsons, A. W. Robinson, E. P. Raun, George A. Knight, I. W. Ross, D. R. McIntosh and Wm. Strader.

SOUTHERN HEIGHTS AND VISITACION RAILWAY CO. Capital stock, $1,000,000 in 10,000 shares. Directors, Chas. T. Crocker, H. E. Huntington, F. S. Douty, N. T. Smith and J. L. Wilcutt. The new road is to he a single or double-track street road, to be operated by all or any means known or yet to be discovered. The line desired to he followed commences at the intersection of Mission and Sixth streets, to Brannan, to Eighth, across Townsend and Channel, to Kansas, to Santa Clara, to Connecticut, to Solano, to Kentucky, to and across Tnlare, Islais creek channel and Islaie street, to Railroad avenue, thence along Railroad avenne to the southerly end thereof. Also commencing

at the intersection of Kentucky and Solano streets, along Kentucky to Fourth, to King. The combined length of the railroads is estimated at eight miles. This incorporation covers a franchise granted several months ago to Abner Doble. I. C. Stump and others, who at once commenced the work of grading at several points over which the proposed road passes. There was an understanding, however, with the Southern Pacific Company from the first that construction should be done by that corporation, and the incorporation is in accordance with that agreement. A large force of men will be put to work at once, and construction will be hurried to completion at the earliest possible date. The Southern Pacific Company will, of course, own and operate the new line.

REED MINING AND MILLING CO. Capital stock, $2,000,000. Directors—M. J. McDonald, J. H. Isham, E. D. Rue, M. A. Jackson and C. E. Anderson.

PACIFIC CONSTRUCTION CO. Capital stock, $250,000. Directors—J. P. McCormick, W. F. Kearns, T. J. McCormick, A. J. Meadows and J. H. Perry.

PLACER COUNTY LAND AND IMPROVEMENT CO., Newcastle, Placer county. Capital stock, $100,000. Directors—A. H Schnabel, J. D. Matthew, E. B. Silva, F. J Mason and A. H. Schnabel.

GIANT POWDER CO. CONSOLIDATED. Capital stock, $5,000,000. Object, to manufacture, purchase, use and deal in dynamite and other explosives in this city and county Directors—Albert Dibblee, E. M. Root, James B. Stetson, Henry Epstein, L. P. Drexler, E. B Pond and Gustav Sutro.

HORSESHOE MINING CO. of Grass Valley district. Directors—J. R. Cooley, J. W. Rumsey, Geo. T. Tracy, John E. Cooley and Geo. E. Riley. The mine is located on Wolf creek, in the vicinity of the Omaha, Nevada county, and a considerable amount of work has been done on it in sinking a shaft.

TRINITY RIVER HYDRAULIC GOLD MINING CO. Capital stock, $500,000. Principal offices in Denver, Colo., and Weaverville, Trinity county, Cal. Directors—L. L. Hailey, William Gelder, A. C. Dunbar, E. S. Rogers, Frank B. Adams and George Arthur Price.

MARKET REPORTS.

Local Markets.

SAN FRANCISCO, Aug. 25, 1892.

General trade the past week was fairly active. Buyers for interior houses report freer purchases than at any time in this year. They also say that their orders indicate caution and no desire to stock up beyond near-by trade requirements. Not even prospective higher prices in any line of goods offer sufficient inducements for overbuying. The margin of profits on all goods sold is the smallest ever before known. They appear to have been reduced through competition and other causes to such low percentages that business in some branches is only carried on for the pure love of being in business and not for the money there is in it. The low freights by sail from the East to this port are largely in favor of this city, and if only lower local freights could be secured, then trade would again be booming. With foundrymen and ironworkers in general a fair degree of activity is reported, but under close figuring through competition, the profits are small. The lower prices at which raw material is generally being secured are largely in their favor. The present and seemingly unwarranted depression in the market value of silver has contributed largely in curtailing the demand for mining machinery. There is a growing impression with better informed financiers that the leading commercial countries of the world will be forced to take action looking to remonetizing of silver, but whether it will be done at the coming International Monetary Conference is an open question; but that it will be done within the next five years is conceded by all. It is quite generally affirmed that England will be certainly most affected by the decline in silver, though a gold-standard government, because she is so closely connected in a mercantile and political way with the East, where silver is the standard. English merchants are simply preparing for any storm that may break. By being prepared, half the trouble is averted. The proposed silver conference may be the means of helping the mercantile and financial world out of the trouble into which it is now plunged. The exports of gold from this country continue, with, seemingly, no let up. The exporting of gold is claimed to be due to continued unloading of American seeurities by European investors. It this be true, then there must be a powerful moneyed syndicate at the East taking all that is offered, for the market not only absorbs all that is offered without shading prices, but, on the contrary, firmer prices obtain. The local money market is fairly easy, notwithstanding an increasing demand for funds with which to move the crops. Remittances from the interior are fair, free from the large fruit-growing sections, but light from other localities owing to farmers storing their grain. Eastern mail advices report an outflow of currency to the agricultural States for crop purposes. The general tenor of advices from the East are of a decidedly favorable character.

SILVER—The market has fluctuated slightly. The very low prices now ruling would, under ordinary circumstances, lead to an active bull campaign, but just at this time it seems as if those who have been bullish in their operations are not now prepared for active operation, while the strong bear syndicate does not appear to be quite ready. There are those who still claim that the price of the metal will go to about 80 cents in New York before the manipulators are prepared to commence pegging on an advance. What the prediction for lower prices are grounded on we do not know. Advices from Mexico report silver mining demoralized, and we might also say that the same condition obtains in the United States. The production is being curtailed in every silver-producing country.

MEXICAN DOLLARS—The market is quiet at around 67½ cts.

QUICKSILVER—Receipts the past week aggregate 475 flasks. The market is quoted unchanged, but it is reported that sales have been made at lower prices.

TIN—There was received from San Diego the past week 214 pigs. The market for both pig and plate is inactive and barely steady.

PIG LEAD—The market is sluggish, with a steady tone reported. At the East our advices report a slow market with both producers and consumers indifferent. It is claimed that the production is lessening.

COPPER—The market has held fairly firm. New York mail advices report an inactive market, with "very little, if anything, more than merely routine buying, and efforts in the direction of inducing consumers to take hold more liberally are apparently unavailing. Prices have undergone no decided change. Current quotations are 11⅝@11¾c for Lake Superior product, 11c for electrolytic, and 10⅝@10¾ for common casting brands."

PIG IRON—Imports the past week aggregate as follows: 447 tons from New York and 800 tons from Newcastle, England; total, 1247 tons. The local market is reported largely in buyers' favor, owing to liberal supplies here and on the way. New York mail advices to August 20th report as follows: "The slow condition of affairs in the manufactured iron trade still so offsets the reduced production of pig iron that the market for the latter remains in rather poor shape. Thus, a southern producer is said to have sold gray forge delivered in central Pennsylvania, four months, at $12, equal to $7 94 at furnace, which rate is understood to be the lowest yet made. Pittsburg makers of gray forge have reduced their price to $12.50. It is remarkable in connection that the southern output is undergoing a sharp reduction. The Tennessee Co. has stopped two furnaces at Birmingham on account of the condition of the market, and has been forced by the Tennessee labor riots to bank the two South Pittsburg furnaces. It is reported also that three De Bardeleben stacks have been banked, owing to a controversy over an ore contract. Some Virginia furnaces have also stopped, making altogether a considerable reduction during the past week or ten days."

COKE—Imports the past week aggregate 1541 tons. The market is essentially unchanged.

COAL—Imports the past week aggregate as follows: Coos Bay 1610 tons, Nanaimo 2840, Sydney 1603, Seattle 1251, Departure Bay 1550, Tacoma 4700. Total 13,554 tons. The market, contrary to general opinion, does not anvance, notwithstanding the advanced season. The consumption so far is less than had been expected even by the best informed. It is claimed that the largest consumers are well-supplied for near-by and distant wants. They bought under the belief that the supply would lessen, and, as winter months approached, higher prices would rule. More vessels are loading at Newcastle, N. S. W., for this port.

Mining Share Market.

SAN FRANCISCO, Aug. 25, 1892.

During the week under review, the market for shares in the Comstock mines has been going from bad to worse, which gives color to the general belief that Bob Morrow and his tools in the board succeeded in putting into force the reported order of D. O. Mills for lower prices. Although the market has shaded off from 10 to 20 per cent, yet it looks as if the bottom has not been touched. The bear orders have so far been easily executed, and that, too, without the rings losing a share. The long, continuous drag with assessments following assessments, while much of the bullion was spirited away, has driven the better class of outside operators from the thieving game, and left the chronic traders to the tender mercy of bands of hyenas. It is only to be hoped that the latter, for the want of other food or spoils, will commence on each other, in which event outsiders may stand a far better show of coming out ahead. The long-drawn-out civil suit of the Mining Stock Association against the late directors of the Hale & Norcross Mining Co. is creating adverse criticism. The question is being more generally asked why the association, if it desires to have created true reforms on the Comstock, does not commence criminal proceedings against those who are charged with about every crime that it is possible to accuse them of? There are many who are inclined to the opinion that the association stands very much in the light of a dog in the manger, or, in other words, they will not force the issue by criminal proceedings, while by their actions they deter others. While giving the side of chronic growlers who never do anything but wail. Micawber-like, for something to turn up, yet to the writer it seems that the association has accomplished very much, and for which the members deserve credit. They have made a fight, and a strong fight too, against a powerful moneyed combination and brought to light much that was not before known. In the securing of the evidences of guilt against the mill rings and their tools, time and a large expenditure of money were necesssary, both of which were used economically and with the best possible results, which was clearly shown at the suit of M. W. Fox against the late directors of the Hale & Norcross Co. The net of facts which was brought out in evidence, was so closely woven that it was impossible for the conspirators to escape. And now for the result. There cannot be the least doubt but the case will be appealed, or, at least, it looks so now; yet the conviction has dawned on the minds of some of the other Comstock millowners that unless reforms are instituted in the working of the mines, and in the milling of ore so as to have the law under which the companies incorporated, conformed to, they may get into far more serious trouble than have the late directors of the Hale & Norcross Co. The Overman Mining Co., which, it is claimed, that Bob Morrow controls, was the first to accept the situation and give public the average car-sample assays of all ore hoisted. The company also had the superintendent give fuller and more detailed reports of work done on each level in the mine. While the company ran behind financially, and found it necessary to levy assessments, yet in obeying the law the officers cannot be too highly commended, for it looks as if, should they show up a valuable deposit of ore, outside shareholders will get some benefit. Not content with conforming to the law, the Board of Directors of the company met lately and appointed two members to visit Virginia and report on the feasibility of buying or leasing a mill to reduce the ore, which is now said to be low-grade assaying about $17 per ton, at a saving on present cost. The Savage Mining Co. is also apparently moving in the direction of reform. It is also claimed that the Hale & Norcross Co. management is looking "kind o' cross-eyed" toward reform. It is only necessary to get an entering reform-wedge in on the Comstock so as to split the mill rings wide open and bring about the long-needed reforms.

After draining all the mining shares possible from the outsiders, the Pumping Association announce that everything will soon be in readiness to commence pumping the water from the Gold Hill mines. The association has been about three years getting ready, during which time assessments followed with the regularity of clockwork, to get money to defray the expenses.

It has not been officially announced to whom the three stray bars of bullion belong. The old game of "Thimble, thimble, who has the thimble," is doubly discounted by the new game of "Bullion, bullion, who gets the bullion."

It looks as if the brokers first sold themselves, and the buyers having very little use for them now, are desirous of selling the Stock Exchange building.

News from the Comstock mines is uniformly favorable. Private advices report very rich ore in two of the North End mines, in one of the Middles and in three of the Gold Hill mines, and also in Occidental. But then the more that rich ore is reported the lower goes the share market and the more assessments are levied. It is now claimed that there will be sufficient water in Carson river next month to run the mills situated on the river, and in anticipation of such an event more miners are to be put to work in the Gold Hill mines. This probably means more assessments, provided there is no change for the better in their management. It is claimed that Con. Imperial and two or more other mines in the Gold Hill group have been systematically looted through the Yellow Jacket or in some other way. If this is so, it is to be hoped that those who are guilty will be brought up with a round turn.

From the outside mines the news continues of a favorable character but the market value of the shares is so low as not to attract attention to the mines.

The market opened this morning very strong at an advance in Hale & Norcross, which caused the list to sympathize. After regular Call, trading became more active, with a gain at the close of informal session this morning. Although the market acts as if it might do better, yet the prevailing opinion is that the inside is not quite ready to aid in promoting a deal.

Eastern Metal Markets.

NEW YORK, Aug 24.—The following are the closing prices the past week:

	Silver in London.	Silver in New York.	Copper.	Lead.	Tin.
Thursday	37⅝	82½	11 50	4 00	20 35
Friday	37⅝	82½	11 50	4 00	20 35
Saturday	38	82½	11 50	4 05	20 40
Monday	38 3-16	83¼	11 50	4 05	20 45
Tuesday	37 15 16	82¾	11 50	4 05	20 45
Wednesday	37 15-16	82¾	11 50	4 05	20 35

Quicksilver is weak and unsettled at a further decline. Pig Iron shows signs of steadying off. Tin is barely steady. Copper is inactive but steady. Borax is slower.

MINING SHAREHOLDERS' DIRECTORY.

COMPILED EVERY THURSDAY FROM ADVERTISEMENTS IN THE MINING AND SCIENTIFIC PRESS AND OTHER S. F. JOURNALS.
